

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

PREFACE

THE NEW INTERNATIONAL YEAR BOOK for 1915, the ninth in the new series which began with the 1907 volume, follows the same plan as its predecessors. That is to say, it is designed as an encyclopædia of the year, with the titles arranged in a single alphabet, and the text written anew each year. In the 1915 volume as in the one before, the effect of the war was to reduce the amount of available statistical information under certain heads. The space thus saved has been given to the comprehensive article on the WAR OF THE NATIONS, and to the many and diverse articles on subjects relating directly or indirectly to the war. The leading articles in this important group are: The WAR OF THE NATIONS, a clear and compact narrative by Professor Carlton Hayes, who wrote the corresponding article for the 1914 Year Book; UNITED STATES AND THE WAR, an impartial, explanatory record of the effects of the war on our foreign relations, by Professor Nelson P. Mead; supplementary articles on separate topics in the same field, such as LUSITANIA, PREPAREDNESS, INTERNATIONAL PEACE AND ARBITRATION (the last named by Mr. Clinton Rogers Woodruff); MILITARY PROGRESS, by Lieutenant Col. C. De Witt Willcox; NAVAL PROGRESS, SUBMARINES, and BATTLESHIPS, by Captain Lewis Sayre Van Duzer; AËRONAUTICS, etc., and also the biographies of persons brought into prominence by the events of the war. To aid the reader in following the year's fighting, color maps of the general fields of operation and sketch maps of the chief campaigns and battles are included.

Among the subjects treated the following may be mentioned: The field of fine arts, including MUSIC, the DRAMA, PAINTING AND SCULPTURE, ARCHITECTURE; LITERATURE, at home and abroad; the separate sciences and branches of learning, such as ASTRONOMY, CHEMISTRY, ZOÖLOGY, MEDICINE, PHYSICS, POLITICAL SCIENCE, POLITICAL ECONOMY, ENGINEERING, PHILOLOGY, PHILOSOPHY, etc.; articles on RELIGION, EXPLORATION, POLAR RESEARCH, Sports, Trade, Industry, and Business represented in such articles as BANKS AND BANKING, FINANCIAL REVIEW, INSURANCE, TRUSTS, LABOR, STRIKES, SHIPBUILDING, BUILDING OPERATIONS, etc.; gazetteer information under each of the States of the United States and the foreign countries; a series of biographies of men who have died during the year or who have been brought into prominence through public events; an historical record of the year's events under each foreign country as well as under UNITED STATES.

FRANK MOORE COLBY.

EDITOR
FRANK MOORE COLBY, M. A.

ASSOCIATE EDITORS
ALLEN LEON CHURCHILL
HORATIO S. KRANS, PH.D.

LIST OF CONTRIBUTORS

AGRICULTURE, HORTICULTURE, FOOD, IRRIGATION, BOTANY, FOR- ESTRY, ETC.

EDWIN WEST ALLEN, PH.D.,
UNITED STATES DEPARTMENT OF AGRICULTURE;
ASSISTED BY EXPERTS IN THE DEPARTMENT OF
AGRICULTURE AT WASHINGTON,
AND
ALFRED CHARLES TRUE, PH.D.,
UNITED STATES DEPARTMENT OF AGRICULTURE.

ANTHROPOLOGY AND ETHNOLOGY

ROBERT H. LOWIE, PH.D.,
AMERICAN MUSEUM OF NATURAL HISTORY, AND
CLARK WISSLER, PH.D.,
AMERICAN MUSEUM OF NATURAL HISTORY.

ARCHÆOLOGY

OLIVER SAMUEL TONKS, PH.D.,
PROFESSOR OF ART, VASSAR COLLEGE.

ARCHITECTURE

RICHARD F. BACH,
CURATOR, SCHOOL OF ARCHITECTURE, COLUMBIA
UNIVERSITY.

ASTRONOMY AND METEOROLOGY

T. W. EDMONDSON, PH.D.,
PROFESSOR OF MATHEMATICS, NEW YORK UNI-
VERSITY.

CHEMISTRY, INDUSTRIAL, AND EX- POSITIONS

MARCUS BENJAMIN, PH.D., Sc.D., LL.D.,
EDITOR FOR THE UNITED STATES NATIONAL
MUSEUM.

CHEMISTRY, GENERAL PROGRESS OF HARRY ESSEX, PH.D., AND LEONARD M. LIDDLE, PH.D.,

RESEARCH ASSOCIATES OF THE MELLON INSTI-
TUTE, UNIVERSITY OF PITTSBURGH, WITH THE
ASSISTANCE OF
M. A. ROSANOFF, Sc.D.,
WILLIAM GIBBS PROFESSOR IN THE MELLON IN-
STITUTE, UNIVERSITY OF PITTSBURGH.

DRAMA

CLAYTON HAMILTON, M.A.,
DRAMATIC CRITIC OF THE "BOOKMAN."

ECONOMIC AND POLITICAL SCIENCE

FRANK HAMILTON HANKINS, PH.D.,
ASSISTANT PROFESSOR OF ECONOMICS AND SOCI-
OLOGY, CLARK COLLEGE.

EDUCATION

MILO B. HILLEGAS, PH.B.,
ASSISTANT PROFESSOR OF ELEMENTARY EDUCA-
TION, TEACHERS COLLEGE, COLUMBIA UNIVER-
SITY.

ELECTRICAL ENGINEERING AND PHOTOGRAPHY

REGINALD GORDON.

EUGENICS

ALVAN A. TENNEY, PH.D.,
ASSISTANT PROFESSOR OF SOCIOLOGY, COLUMBIA
UNIVERSITY.

EXPLORATION AND POLAR RE- SEARCH

A. W. GREELY, PH.D.,
MAJOR-GENERAL, UNITED STATES ARMY.

FEMINISM: WOMAN MOVEMENT; WOMAN SUFFRAGE

JULIET STUART POYNTZ, A.M.,
AMERICAN ASSOCIATION FOR LABOR LEGISLATION.

FOREIGN GAZETTEER

EDWARD LATHROP ENGLE AND
ALLAN EVA ENGLE.

FOREIGN HISTORY AND POLITICS

CARLTON H. HAYES, PH.D.,
ASSISTANT PROFESSOR OF HISTORY, COLUMBIA
UNIVERSITY.
PARKER T. MOON,
INSTRUCTOR IN HISTORY, COLUMBIA UNIVERSITY.

GEOLOGY

DAVID HALE NEWLAND, A.B.,
ASSISTANT STATE GEOLOGIST, NEW YORK.

INTERNATIONAL ARBITRATION AND PEACE

CLINTON ROGERS WOODRUFF, LL.B.,
SECRETARY OF THE NATIONAL MUNICIPAL
LEAGUE AND OF THE MOHONK CONFERENCE, AND
PRESIDENT OF THE BOARD OF PERSONAL REGIS-
TRATION, PHILADELPHIA.

JEWS AND JUDAISM

DAVID A. MODELL, A.M.

LIBRARY PROGRESS

WILLIAM W. BISHOP, A.M.,
SUPERINTENDENT OF THE READING ROOM, LI-
BRARY OF CONGRESS, WASHINGTON, D. C.

LITERATURE, ENGLISH AND AMERICAN

HORATIO S. KRANS, PH.D.

LITERATURE, FRENCH

ALBERT SCHINZ, PH.D.,

PROFESSOR OF FRENCH LITERATURE, SMITH COLLEGE.

LITERATURE, GERMAN

AMELIA VON ENDE,

CONTRIBUTOR TO NEW YORK "EVENING POST" AND "THE NATION."

LITERATURE, ITALIAN

ALBERT ARTHUR LIVINGSTON, PH.D.,

ASSISTANT PROFESSOR OF THE ROMANCE LANGUAGES AND LITERATURE, COLUMBIA UNIVERSITY.

LITERATURE, SCANDINAVIAN

HARRY V. E. PALMBLAD, A.M.,

INSTRUCTOR IN GERMANIC LANGUAGES AND LITERATURES, UNIVERSITY OF KANSAS.

LITERATURE, SPANISH

JOHN DRISCOLL FITZ-GERALD, PH.D.,

MEMBER OF THE HISPANIC SOCIETY OF AMERICA, CORRESPONDING MEMBER OF THE SPANISH ROYAL ACADEMY, ASSISTANT PROFESSOR OF ROMANCE LANGUAGES, UNIVERSITY OF ILLINOIS.

MANUFACTURES, CIVIL ENGINEERING, TECHNOLOGY, AERONAUTICS, AND FIRE PROTECTION

HERBERT TREADWELL WADE.

MEDICINE

ALBERT WARREN FERRIS, A.M., M.D.,

MEDICAL EXPERT TO STATE RESERVATION COMMISSIONERS AT SARATOGA SPRINGS; CONSULTING PHYSICIAN, ITALIAN HOSPITAL, NEW YORK; AND OF BINGHAMTON STATE HOSPITAL; FORMER SENIOR RESIDENT PHYSICIAN, GLEN SPRINGS, WATKINS, N. Y.; FORMER PRESIDENT, N. Y. STATE COMMISSION IN LUNACY; FORMER ASSISTANT IN NEUROLOGY, COLUMBIA UNIVERSITY; FORMER ASSISTANT IN MEDICINE, NEW YORK UNIVERSITY AND BELLEVUE HOSPITAL MEDICAL COLLEGE; ASSISTED BY

DAVID GILBERT YATES, M.D.,

SURGEON, NEW YORK CHILDREN'S HOSPITAL; SURGEON, DEMILT DISPENSARY, NEW YORK CITY.

MILITARY PROGRESS

C. DEW. WILLCOX,

LIEUTENANT-COLONEL, U. S. A., PROFESSOR OF MODERN LANGUAGES, U. S. MILITARY ACADEMY.

MILITARY STATISTICS FOREIGN

HERBERT TREADWELL WADE.

MUSIC

ALFRED REMY, M.A.,

EXTENSION LECTURER, COLUMBIA UNIVERSITY; FORMER PROFESSOR OF HARMONY AND COUNTERPOINT, INTERNATIONAL CONSERVATORY, NEW YORK; LECTURER ON THE HISTORY OF MUSIC, NEW YORK COLLEGE OF MUSIC.

NAVAL PROGRESS AND BATTLESHIPS

LEWIS SAYRE VAN DUZER,

CAPTAIN IN THE UNITED STATES NAVY, RETIRED; EX-SECRETARY OF THE UNITED STATES NAVAL INSTITUTE.

PAINTING AND SCULPTURE

FORBES WATSON,

CONTRIBUTOR TO THE NEW YORK "EVENING POST" AND "THE NATION."

PHILOLOGY

CHARLES KNAPP, PH.D.,

PROFESSOR OF CLASSICAL PHILOLOGY, BARNARD COLLEGE, COLUMBIA UNIVERSITY; AND JOHN LAWRENCE GERIG, A.M., PH.D., ASSOCIATE PROFESSOR OF CELTIC, COLUMBIA UNIVERSITY.

PHILOSOPHY

FRANK THILLY, A.M., PH.D., LL.D.,

PROFESSOR OF PHILOSOPHY, SAGE SCHOOL OF PHILOSOPHY, CORNELL UNIVERSITY.

PHYSICS

WILLIAM W. STIFLER, PH.D.,

INSTRUCTOR IN PHYSICS, COLUMBIA UNIVERSITY.

PSYCHOLOGY, PSYCHICAL RESEARCH

EDWARD BRADFORD TITCHENER, D.Sc., PH.D., LL.D., Litt.D.,

SAGE PROFESSOR OF PSYCHOLOGY, GRADUATE SCHOOL OF CORNELL UNIVERSITY.

CHRISTIAN A. RUCKMICH, PH.D.,

INSTRUCTOR IN PSYCHOLOGY, UNIVERSITY OF ILLINOIS.

RAILWAYS

WILLIAM E. HOOPER,

ASSOCIATE EDITOR, "RAILWAY AGE GAZETTE."

RELIGIOUS DENOMINATIONS AND SOCIETIES

JOHN W. RUSSELL, M.A.

SANITARY ENGINEERING AND MUNICIPAL ACTIVITIES

MOSES NELSON BAKER, PH.B., C.E.,

EDITOR OF THE "ENGINEERING NEWS."

SPORTS

CHARLES A. TAYLOR,

MEMBER OF THE STAFF OF THE NEW YORK "TRIBUNE."

UNITED STATES AND THE WAR

NELSON P. MEAD, PH.D.,

ASSOCIATE PROFESSOR OF HISTORY, COLLEGE OF THE CITY OF NEW YORK.

UNIVERSITIES AND COLLEGES

MILO B. HILLEGAS, PH.D.,

ASSISTANT PROFESSOR OF ELEMENTARY EDUCATION, TEACHERS COLLEGE, COLUMBIA UNIVERSITY.

WAR OF THE NATIONS, AND SOCIALISM

CARLTON H. HAYES, PH.D.,

ASSISTANT PROFESSOR OF HISTORY, COLUMBIA UNIVERSITY.

ZOOLOGY

AARON L. TREADWELL, PH.D.,

PROFESSOR OF BIOLOGY, VASSAR COLLEGE.

MESOPOTAMIA AND ITS STRATEGIC POSITION	721

NOTE: Cross references in SMALL CAPITALS indicate that the allusion is to a separate article; cross references in *italics* denote that the reference is to a subdivision of a main article. A cross reference in *italics*, standing alone in an article, carries the reference to another subdivision of the same article. The letters q. v. (*quod vide* = Latin "which see") in parentheses following a word, indicate that the subject is treated under its own name elsewhere in the volume.

NOTE: In certain tables in this work it will be found, by addition, that the totals do not correspond to the sum of the items. This is the result of the omission or inclusion of certain small items which are not mentioned in the table, but are included in the totals. This is a usage frequently employed in the compilation of government statistics, from which sources the greater number of the tables in the YEAR BOOK are taken.

THE NEW INTERNATIONAL YEAR BOOK

A. B. C. PEACE TREATY. See ARGENTINA, section so entitled; BRAZIL, *History, Relations with Other South American Countries*; CHILE, *History, Chilean Relations with Foreign Countries*; and INTERNATIONAL PEACE AND ARBITRATION.

ABYSSINIA. An independent empire of eastern Africa. The area is estimated approximately at 432,000 square miles. The population consists of Semitic Abyssinians, Gallas and Somalis, negroes, Falashas, and non-natives—in all between 9 and 11 millions. Addis Abeba, the capital, has about 60,000 permanent inhabitants and a floating population of about 30,000; Harar, 40,000; Aksum, 5000; Diré Dawa, 5000. The Coptic Christian is the national church, and education is in the hands of Coptic teachers. The ruler is a Coptic Christian, but large numbers of his subjects are Mohammedans and pagans. Cattle and sheep raising and a primitive sort of agriculture are the main industries. The forests yield rubber and valuable timber. Gold-mining tracts extend along the banks of the Baro River, and coal has been found.

Imports through Jibuti in 1909, about £811,566; in 1910, £950,147. Exports by way of Jibuti average £335,000. Imports through Zeila, the Sudan, and Italian colonies, about £192,795 in 1909; exports average about £40,000. The total trade by way of Jibuti in 1911 was valued at 8,722,531 francs imports, and 11,765,844 francs exports; by way of Eritrea, 2,320,558 lire imports, and 3,072,100 lire exports; by way of Gambela in the Sudan, £E27,962 imports, and £E37,754 exports. A British source gives the total trade through Jibuti in 1912, imports and exports, at £588,924; imports through the Sudan £34,280 and exports, £38,720. The imports (chiefly from Great Britain, France, India, Italy, and the United States) are gray shirting, other cotton goods, arms and ammunition, foodstuffs, beverages, railway material, and petroleum. The exports are hides and skins, coffee, wax, ivory, civet, etc. A railway extends from Jibuti to Diré Dawa, a distance of 309 kilometers, of which 219 kilometers are in Abyssinian territory. An extension from Diré Dawa to Meheesso, 152 kilometers, was opened in 1913; the extension from Meheesso to Addis Abeba, 328 kilometers, is under construction. Telegraph lines connect the capital with Harar, with Jibuti, and with Massaua in Eritrea.

The government is essentially feudal in character, each large province being governed by a

ras, a prince or feudal chief, under an emperor whose power is absolute. Lij Yasu, born 1896, succeeded to the throne upon the death of Menelek II, Dec. 11, 1913. He is the son of Menelek's second daughter, Waizaro Shoa Röggä, and Ras Mikael, the chief of the Wollo Gallas. Menelek II (born 1844) had been emperor from 1889 until his death; but, owing to his incapacity, the government had been administered since 1910 by his grandson under the advice and direction of regents.

According to a statement made in December by Pierre Alype, a member of the Colonial Committee of the French Chamber of Deputies, the Emperor of Abyssinia had offered to furnish the Entente Allies with 200,000 troops whenever necessary.

ACADEMY, FRENCH (ACADÉMIE FRANÇAISE). The first to be founded (1635) and the most noted of the five academies constituting the Institute of France, the other four being: the Academy of Inscriptions and Belles-lettres, the Academy of Sciences, the Academy of Fine Arts, and the Academy of Moral and Political Science. The members of the French Academy, elected for life, and known as the "Forty Immortals," take rank as the leading Frenchmen of letters of their time; and collectively they are the last resort in all disputed literary matters. Fifteen hundred francs are given as a yearly honorarium to each member, and more than 12,000 francs are distributed annually in prizes. Two members, Alfred Jean François Mézières (q.v.) and Paul Hervieu (q.v.), died during 1915, leaving seven vacancies, which were not filled.

ACADEMY OF ARTS AND LETTERS, AMERICAN. A body of distinguished men, limited to 50, and selected from the membership of the National Institute of Arts and Letters. The Institute was organized at a meeting of the American Social Science Association in 1898. It was patterned in a general way after the French Academy. From its foundation in 1904, its president has been William Dean Howells. The Academy and the National Institute hold joint annual meetings, the last of which took place in Boston on Nov. 18 and 19, 1915. The gold medal of the academy was awarded to Dr. C. W. Eliot, ex-president of Harvard University. Since the last meeting in 1914 eight new members have been elected. On Nov. 24, 1915, the membership included: William Dean Howells, Henry James, Henry Adams, Theodore Roosevelt, John Singer Sargent, Daniel Chester French, John Burroughs, James Ford Rhodes,

Horatio William Parker, William Milligan Sloane, Robert Underwood Johnson, George Washington Cable, Andrew Dickson White, Henry van Dyke, William Crary Brownell, Basil Danneau Gildersleeve, Woodrow Wilson, Arthur Twining Hadley, Henry Cabot Lodge, Edwin Howland Blashfield, William Merritt Chase, Thomas Hastings, Hamilton Wright Mabie, Brander Matthews, Thomas Nelson Page, Elihu Vedder, George Edward Woodberry, Kenyon Cox, George Whitefield Chadwick, Abbott Handerson Thayer, Henry Mills Alden, George de Forest Brush, William Rutherford Mead, Bliss Perry, Abbott Lawrence Lowell, James Whitcomb Riley, Nicholas Murray Butler, Paul Wayland Bartlett, Owen Wister, Herbert Adams, Augustus Thomas, Timothy Cole, Cass Gilbert, William Roscoe Thayer, Robert Grant, Frederick MacMonnies, Julian Alden Weir, William Gillette, Paul Elmer More, George Lockhart Rives.

The first seven members were: William Dean Howells, Augustus Saint-Gaudens, Edmund Clarence Stedman, John La Farge, Samuel Langhorne Clemens, John Hay, and Edward MacDowell. William Milligan Sloane is chancellor and treasurer, and Robert Underwood Johnson, 52 Vanderbilt Avenue, New York City, is permanent secretary.

ACCIDENTS. See **RAILWAY ACCIDENTS**; **SAFETY AT SEA**; **WORKMEN'S COMPENSATION**; and **COAL, Accidents**.

ACCUMULATOR. See **ELECTRIC BATTERIES**.

ADAMS, CHARLES FRANCIS. An American soldier, publicist, and historian, died March 20, 1915. He was born in Boston in 1835. His father, Charles Francis Adams, was an American minister to England, and was the son of John Quincy Adams, and the grandson of John Adams. The son, Charles Francis Adams, was educated in a private school, and at Harvard College, from which he graduated in 1856. He studied law and in 1858 was admitted to the Massachusetts bar. At the outbreak of the Civil War he entered the service as a first lieutenant in the first Massachusetts Cavalry. He was promoted successively to be captain, lieutenant-colonel, and colonel of a regiment of colored cavalry, and was finally mustered out, and brevetted as brigadier-general of volunteers. After leaving the army, he entered the railway business, and gained a national reputation as an expert in traffic and administrative problems. He was a member of the Board of Railroad Commissioners of Massachusetts from 1869-79, and from 1877-90 he was director of the Union Pacific Railroad, and was president of the same road from 1884-90. Mr. Adams was best known, however, for his numerous important services to the public. He was chairman of the Commission which planned the Massachusetts Metropolitan Park System. From 1882-94 and again from 1895-1907, he was overseer of Harvard University. He was one of the foremost historical writers of the United States; had a remarkable grasp of political and economic problems; and was constantly in demand for lectures on political, economical, and historical subjects. Mr. Adams was bitterly opposed to the high tariff policy. Much of his historical work had to do with the Civil War. He greatly admired General Lee, and wrote much

about him. It was he who suggested that a monument of General Lee be erected in Washington. Mr. Adams's brothers, Brooks and Henry, are both well known historians. He was a member of many learned societies. His published writings include: *Chapters on Erie and Other Essays* (written with his brother, Henry Adams, 1871); *Railroads, their Origin and Problems* (1878); *Notes on Railway Accidents* (1879); *Massachusetts, Its Historians and Its History* (1893); *Life of Charles Francis Adams* (1900); *Richard Henry Dana, a Biography* (1891); *Lee at Appomattox and Other Papers* (1902); and *Studies Military and Diplomatic*. He received the degree of LL.D. from Princeton University in 1895.

ADAMSON, ALFRED. A rear admiral retired of the United States navy, died Feb. 23, 1915. He was born in Brownville, New York, in 1838. In 1861 he was appointed third assistant engineer, United States navy, and he passed through successive steps of promotion until he became chief engineer in 1879. He was retired on account of age in 1898. In 1906 he was advanced to the rank of rear admiral retired in recognition of his Civil War services.

ADDAMS, JANE. See **WOMAN MOVEMENT**.

ADEN. A British possession in Southwestern Arabia, forming a part of the Bombay Presidency of British India. It consists of a peninsula and a small strip of coast. Area, 75 square miles, or with the Island of Perim 80 square miles. Population in 1911, 46,165, as compared with 43,974 in 1901. A territory extending inland from Aden, about 9000 square miles in area, is under British protection; estimated population, about 100,000. The town of Aden is strongly fortified and constitutes an important coaling and transshipment station. Except the small quantities of exports and imports to and from Arabia, the trade is almost wholly transit. In 1913-14 imports of private merchandise by sea were valued at £3,756,964; by land, £170,213; imports of treasure, £450,305. Private exports by sea in that year, £3,267,283; by land, £140,159; exports of treasure, £741,687. The leading imports by sea are cotton goods, grain, hides and skins, and tobacco. The exports by sea include these articles together with coffee, gums, civet, and wax. In 1913-14 there were entered at the port of Aden 1529 merchant vessels, of 3,925,044 tons. Aden is subject to the government of Bombay and is administered by a resident, who is also commander of the troops in the garrison. Administratively attached to Aden, besides Perim, are Socotra and the Kuria Muria islands.

In the course of the **WAR OF THE NATIONS** (q.v.) an attack was made on Aden by the Turks. Having occupied Lahej in July, the Turkish troops advanced to Sheikh Othman in the near vicinity of Aden and menaced the fortress of Aden. The British garrison successfully repulsed the attack, according to the statement given out in December by the British India Office, and only insignificant skirmishes occurred thereafter. The operations around Aden were considered of great importance, inasmuch as the capture of the town by the Turks would imperil the main line of communication between England and her Asiatic colonies.

ADICKES, FRANZ. German public official, died Feb. 4, 1915. He was born in 1846. For many years he was mayor of Frankfort, and

owing to his activity in municipal Socialism was one of the most prominent civic officials in Germany. Perhaps his most notable achievement was the establishment of the University of Frankfort in 1914. See **UNIVERSITIES AND COLLEGES**. He resigned as mayor of Frankfort in 1912.

ADULTERATION. See **FOOD AND NUTRITION**, *passim*.

ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE. The 67th annual meeting of the association was held in Columbus, Ohio, Dec. 27, 1915, to Jan. 1, 1916. There were 750 members in attendance. At the same time the following societies affiliated with the Association held their meetings: American Association of Economic Entomologists; American Mathematical Society; American Microscopical Society; American Nature Study Society; American Physical Society; American Phyto-pathological Society; American Society of Naturalists; Association of Official Seed Analysts of North America; Botanical Society of America; Entomological Society of America; Society for Horticultural Science; Southern Society for Philosophy and Psychology; Students and Collectors of Ohio Archaeology; Wilson Ornithological Club. The opening meeting was held in the college chapel of the Ohio State University, over 1200 persons being present. The total number of registered members of the association was 750. Dr. Charles W. Eliot, the retiring president, gave an address on "The Fruits, Prospects, and Lessons of Recent Biological Science." Three public lectures were delivered: by Dr. Douglas W. Johnson, on "Surface Features of Europe as a Factor in the War"; Dr. Raymond F. Bacon, on "The Industrial Fellowships of the Mellon Institute"; and Dr. Frank K. Cameron, on "The Fertilizer Resources of the United States." The council of the association decided that members of the affiliated societies not now members of the American Association be invited to join it in 1916 without payment of the usual entrance fee. The following officers were elected: President, C. R. Van Hise; vice-presidents—mathematics, L. P. Eisenhart; physics, H. A. Bumstead; engineering, E. L. Corthell; geology and geography, R. D. Salisbury; zoölogy, G. H. Parker; botany, T. J. Burrill; anthropology and psychology, F. W. Hodge; social and economic science, Louis I. Dublin; education, L. P. Ayres; agriculture, W. H. Jordan. W. E. Henderson was elected general secretary, and C. Stuart Gager secretary of the council. The Pacific Coast meeting of the association, held in connection with the Panama International Exposition, took place in San Francisco during August 2-9. The president, W. W. Campbell, gave an address on "Science and Civilization." Three public evening addresses were made, respectively, by R. A. Daly, W. B. Scott, and P. S. Reinsch. Over 90 sessions of the association were held during the week. The total registered attendance of members was 606.

ADVANCEMENT OF SCIENCE, BRITISH ASSOCIATION FOR THE. The annual meeting of the association was held at Manchester in the early part of September. The number of members and associates (1438), although not disappointing, considering the war, was small as compared with previous meetings. The reception by the Lord Mayor in the School of Technology on Wednesday evening was the only general social function

of the week. The citizens' lectures given in Manchester and other towns in the neighborhood attracted large audiences. They were on the following subjects: "Education and War," by Prof. F. W. Gamble; "The Strategic Geography of the War," by Dr. Vaughan Cornish; "The Making of a Big Gun," by Dr. W. Rosenhain; "Daily Uses of Astronomy," by A. R. Hinks; "Health Conditions in the Modern Workshop," by Prof. B. Moore; "Formation of the Sun and Stars," by Rev. A. L. Cortie; "Some Lessons from Astronomy," by Prof. H. H. Turner; and "Curiosities and Defects of Sight," by Dr. W. Stirling. Grants of money amounting to £968 were appropriated for scientific purposes on behalf of the general committee to members in the following sections: Mathematical and physical science, chemistry, geology, zoölogy, geography, economic science and statistics, engineering, anthropology, physiology, botany, and education. Notable addresses were made during the meeting by Sir Thomas H. Holland, on "The Organization of Science"; Prof. W. M. Bayliss, on "The Physiological Importance of Phase Boundaries"; Mrs. Henry Sidgwick, on "Educational Science"; Prof. Grenville Cole, on "Geology"; Major H. G. Lyons, on "The Importance of Geographical Research"; Dr. H. S. Hele-Shaw, on "Organization to Meet German Competition at the End of the War"; and Prof. Charles G. Seligman, on "The Early History of the Anglo-Egyptian Sudan from the Point of View of the Ethnologist." The next meeting will be held at Newcastle.

ADVENT CHRISTIANS. See **ADVENTISTS**.

ADVENTISTS. The largest branch of the denomination, the Seventh Day Adventists, had in the United States at the close of 1914, 68,203 communicants, 1913 churches, and 528 ministers. The members of the denomination contribute for evangelistic work about \$3,000,000 annually. Of this amount about 60 per cent is raised in tithes, which is the main source of revenue. The church buildings and property are valued at about \$13,000,000. There are nearly 800 schools with an enrollment of about 30,000. The denomination maintains 37 publishing houses and branches under its control. Over 1600 missionaries are maintained in 67 different countries. About \$1,000,000 is expended in the support of this work. The other branches of the denomination are the Advent Christians, with about 26,000 communicants, 550 churches, and 528 ministers; The Church of God, with about 600 communicants, 20 churches, and 32 ministers; The Life and Advent Union, with 509 communicants, 12 churches, and 12 ministers; and The Church of God in Jesus Christ, with 2224 communicants, 68 churches, and 61 ministers.

ÆGEAN ISLANDS. See **GREECE**.

AERONAUTICS. The year 1915 marked the point where the construction of aeroplanes passed beyond the experimental stage and became an industry. Every detail of their structure and equipment was tested in the great war. The raids of the Zeppelins, largely futile and causing little damage, the destruction of men and property, the various services on the Continent rendered by the aviators of the fighting armies, and the actual combats between air craft, were all features of the great war which will be found discussed elsewhere in the **YEAR BOOK** under **WAR OF THE NATIONS**, **NAVAL PROG-**

RESS, and MILITARY PROGRESS. Naturally the military developments led more to wholesale manufacture than to experimentation, which, when it did take place, was practical rather than scientific. The details of new work and actual construction and performance, so far as the belligerent countries are concerned, are meagre and unreliable. In the United States the manufacture of aeroplanes vastly increased, and by the close of 1915 America was reported to be the largest manufacturer of aeroplanes and their parts, its sales being estimated at almost \$5,000,000.

The result of this activity was the organization of large factories by American manufacturers either in the United States or in Canada. Thus, the Curtiss Company at the end of the year was occupying a large plant in Buffalo, and was said to have contracts for about \$15,000,000 worth of aeroplanes, to be able to turn out daily a complete *America*, the largest size of aeroplane, and to be preparing to turn out daily five so-called *Canadas*—this in addition to the wholesale manufacture of the standard types of the concern. The Wright Aeroplane Company of Dayton, Ohio, changed hands and was capitalized at \$5,000,000. Other works in the United States were the Glenn L. Martin Company, of Los Angeles, the Sturtevant Aeroplane Company, of Massachusetts, the Burgess Company, of Marblehead, Mass., the Thomas Company, of Ithaca, N. Y., and a large number of smaller concerns which were getting ready for increased business.

Many of these manufacturers and aeroplane engineers late in December assembled in conference with members of the Naval Consulting Board and the Society of Aeroplane Engineers to consider the standardization of aeroplanes on a basis similar to that followed so successfully in the American automobile industry. It was urged at this meeting that there be engineering coöperation and standardization of materials, designs, and methods of specification and test, and it was the sense of the various representatives at the conference that the adoption of suitable standards would lay a real commercial foundation for the aeroplane industry in America for future years. Committees of the Society of Aeroplane Engineers were appointed to consider the problems of nomenclature and standardization, and these committees were to work in harmony with the engineers of the army and navy.

Gradually the size and strength of aeroplanes had increased, and machines were constructed by the fighting nations in Europe on a scale that probably never would have been attempted in more pacific times. Biplanes and triplanes spreading over 100 feet were in service, and were being built, while power plants in duplicate and triplicate were being installed on these as well as on smaller machines. One German triplane was stated to have eight Maybach motors coupled in pairs, each pair driving one of four propellers, two of which will drive the plane under ordinary conditions. Provision was being made for larger crews, of six or more men, 20 in the German machine just mentioned, and the weight of bombs, ammunition, fuel, and provisions was far in excess of the most sanguine hopes entertained by designers and aviators a few years previously. In addition much attention was paid to stabilizing, and military

machines were being better equipped with various adjuncts that would relieve the pilot of strain and effort, and better enable him to observe, reconnoitre, drop bombs, or engage in offensive combat with other craft. In the best military aeroplanes the aviator's hands and feet could be taken off the controls long enough for the aviator to use a camera, release a bomb, examine or mark a map, or aim and fire a rifle or pistol.

The year's progress in engine construction was largely towards more powerful plants. Many 12-cylinder engines were being made in sizes ranging from 100 to 250 horse power, and it was observed that the stationary cylinder type was in many places supplanting the rotary engine which previously had the preference. The stationary cylinder engine was found more simple, easier to repair, and of greater reliability, following as it did lines laid down by automobile designers.

In America, Great Britain, France, and Germany, the type favored was the twin-six with stationary cylinders of the V form. The motor with stationary cylinders demonstrated itself as the most efficient, and in fact such an engine of the stationary water cooled type was used in the duration record flight of 24 hours made in 1914 by Reinhold Boehm. Of course for military aviators record breaking was not so much an object as reliability and great horse power to carry the weights—observers, bombs, and other apparatus—required. The V-type motor also showed economy in fuel consumption and a greater radius of action, while in its larger size it had less weight and less bulk than the vertical cylinder engine, and might offer less resistance to the air in flight. The twin-six or twelve-cylinder V-type of motor seemed to be not only a development but the accepted form during the year 1915, and many authorities thought that the 8-cylinder motor would be supplanted by the 6- or 12-cylinder motor, as the latter balanced better, had more torque, and ran smoother.

In France, the Renault Company, which developed an air-cooled 12-cylinder motor of 100 horse power, was manufacturing these machines at the Schneider Automobile Works at Lyons and elsewhere, so that about ten motors a day were turned out for government use, while England, the United States, and other countries were using these motors experimentally. In Great Britain, a notable engine development during the year was the British *Sunbeam*, a 12-cylinder V-type motor built for the great fighting biplanes of the Royal Air Craft Factory. This motor weighed 1085 pounds complete, was water cooled, and could develop 225 horse power. Two such motors were installed on one of the big tractor biplanes which had a wing spread of 70 feet. The motor had a speed of 2000 revolutions per minute, which was reduced to 1000 revolutions for the propeller. Another British engine, somewhat lighter, was built for British experiment by the Rolls-Royce Company, which was a twin-six of 250 horse power and weighed 800 pounds, while a number of American motors were being tested by the British government at the Royal Air Craft Factory at Farnborough.

Among other engines brought out in 1915 was a 12-cylinder V-type water cooled motor weighing 720 pounds, designed by L. E. Rausenberger,

AERONAUTICS

CURTISS FLYING BOAT

A machine of this type made a long distance flight of 554 miles in 10 hours

CURTISS MODEL "R-2" MILITARY TRACTOR

A type of machine made in America and supplied to the armies of the allies. In 1915 it made a notable flight from Toronto to New York, and with three passengers in addition to the pilot made an altitude record of 8024 feet

and planned to give 150 horse power at a normal speed of 120 revolutions per minute. The cylinders are staggered so that the connecting rods of opposite cylinders are placed side by side on the same crank pin. Another notable engine, the Ashmussen 105 horse power motor, water cooled, with cylinders horizontally opposed and weighing 345 pounds, was being developed during the year. The bore and stroke were 3.75 inches and 4.5 inches respectively. Another 12-cylinder motor of the year was the Johnson 2-cycle type of the 90° V-form with a bore of 5 inches and a stroke of 4 inches, with a rating of 150 to 180 horse power, at a speed ranging from 1150 to 1400 revolutions per minute. This engine weighed 598 pounds.

While extensive manufacturing work was being carried on, at the same time the mechanical engineering features were investigated, and Prof. Charles E. Lucke, of Columbia University, was testing modern aeroplane engines for the National Aeroplane Advisory Board, and it was hoped that there would be a contest for aeroplane motors to be held by the United States navy, in which a large number would receive exhaustive scientific tests.

MISCELLANEOUS DEVELOPMENTS. In the various machines turned out during the year from the Curtiss works in Buffalo a number of technical advances were to be noted. In one machine built specially for war purposes, and capable of carrying three passengers besides the pilot, tested during the summer, an American record for climbing with considerable weight was made, as well as a capacity of great speed in ordinary flying demonstrated. With two passengers, an ascent of 8200 feet was made in 27 minutes, and with three passengers a considerably greater elevation was attained in a proportionate time. Here the total live load was 800 pounds and 8300 feet was reached when the barograph ceased recording, and the ascent was continued for another five minutes. The American record for height with two passengers previous to this was 5187, and the world's record with three passengers, 15,650 feet, was made by an Austrian aviator in 1914. This Curtiss machine was of the tractor type where the passengers were placed in a cockpit in front of the pilot, who is located behind the planes. The 160 horse power engine was capable of carrying a load of 1500 pounds dead weight. The control of the machine was said to be perfect and a speed of 94 miles an hour was made without the pilot's touching the wheel.

At the end of the year there was building at the yard of the Curtiss Company of Buffalo what was considered to be the largest and most powerful flying boat aloft. This craft was a development of the *America* which was designed and constructed to cross the Atlantic in 1914, and which was discussed in the 1914 YEAR BOOK. The *America* late in 1914 was purchased by the British Admiralty, and was put in commission with the Coast Defense Aeroplane Squad in connection with the troop transports crossing the English Channel, as she was able to warn such craft against submarines, and it was stated that she destroyed three German submarines and prevented attacks on British transports in the Channel. Accordingly the British Admiralty gave orders during the year, first for 12 and then for 20 flying boats of the *America* class, as they seemed a

most practical defense against submarines, inasmuch as they had a much greater speed and a deep sea vision, so that they could hunt down the submarines and either capture or destroy them with their own bombs, or indicate their position to the protective fleet of fast motor boats.

This battleship aeroplane, as it was termed, building at the end of the year 1915 at the Curtiss Company, was a triple screw triplane weighing, fully equipped, 21,450 pounds. It had a hull of cedar planking, sheathed with copper on the under side and riveted to stout ash ribs. The boat was 68 feet long, with a beam of 20 feet. It had a V-shaped bottom ending in a straight stem forward, while its rear was cut off sharply, so as to facilitate rising from the sea. The lines of the hull were carefully developed in the light of marine experience, and the hull itself was divided into 12 water-tight compartments, one-third of which could keep the machine floating should the hull be pierced and several compartments flooded. The boat contained a conning tower for the control apparatus and the navigating instruments, a cabin for the crew of eight, containing the fuel tanks, ammunition, and stores. The fuel supply was 700 gallons of gasoline, 80 gallons oil, sufficient to give the machine (at a speed of 75 miles an hour) a cruising radius of 675 miles. The superstructure consisted of three supporting planes, with a span of 133 feet, and a chord of 10 feet, with a gap of 10 feet between each two planes, the total area of support being about 4000 square feet. The tip of each lower wing was fitted with a pontoon to prevent digging into the water when running on the surface or when at anchor. The propelling engines consisted of six 160 horse power water cooled V-type engines, which were coupled in twin units of 320 horse power, each unit driving an air screw about 15 feet long. One unit was placed amidships and drove a central pusher screw, and the two others were mounted on the edges of the centre plane on either side and above the cabin, so as to drive a tractor air screw. There was an electric starter auxiliary engine of 40 horse power which generated the current required for the automatic stabilizer, the drift indicator, and the minor apparatus. This auxiliary engine also drove a water propeller for water navigation.

This new flying boat took into consideration every device known for safety and for the remote contingencies of engine failure, as with even one engine running the pilot could climb out of reach of gun fire as well as keep on any desired course. The steering apparatus consisted of a balanced rudder of 54 square feet area, with a keel-fin of 46 square feet area. Longitudinal stability was secured by a tail-fin of 126 square feet area, and an elevator of 96 square feet area. Transverse stability was provided by interconnected ailerons hinged to supporting planes. Nothing definite was revealed as to the armament of this flying boat, but it was stated that it was possible that even a six-pounder might be carried in place of the usual one and one-half pound aircraft gun. While American authorities were not entirely conversant with the most recent practice of European design and construction, yet it was believed that the Curtiss triplane represented a recent and extraordinary development.

On Dec. 12, 1915, a test was made at Readville, Massachusetts, by Lieut. B. Q. Jones, United States army, of an all steel battleplane designed by Grover C. Loening. This machine was a biplane with a wing spread of 65 feet over all. The frame work was of vanadium steel, affording unusual strength, standardized and stamped out by machinery, so that perfect interchangeability and ready repairing were insured should the machine become successful as a type. This consideration was followed throughout the design and construction, as the planes were built up in such a way that any one of the sections could be altered subsequently to secure changes and improvements without impairing the usefulness of the whole, while in case of damage an impaired section could be removed and replaced readily. The engine was a 100 horse power motor, with a propeller mounted in front, and adequate to give a speed of 90 to 95 miles per hour, while the fuel tanks had a capacity for a flight of 800 miles. On its military side an interesting feature was mounting two gun turrets at the tips of the plane, so that a vertical arc of over 90° and a horizontal arc somewhat over 200° could be covered. In times of peace the space devoted to the gun turrets could be used for baggage compartments. About 500 pounds thus could be transported.

The Giant Sikorsky aeroplane developed in Russia rendered important service during the war. This machine it will be recalled could carry 20 passengers for 15 or 20 hours while running at a minimum speed of about 60 miles an hour. This machine was in service for military duty along the Galician front for bombardment and fire control, and was driven by four Salmson motors of 500 horse power. The steel frame of this aeroplane was 66 feet in length and it contained an enclosed cabin, the dining-room of the original ship having been transformed into a munitions magazine.

FLIGHTS. One of the important flights of the year in America was by Victor Calstron, a Curtiss aviator, who flew from Toronto to New York, making a detour to skirt the western end of Lake Ontario, passing over Buffalo at an altitude of 6000 feet, and following the Lackawanna Railroad to Binghamton, where he alighted. On the second portion of the journey he followed the Erie to New York and landed in the Jersey meadows. This flight was accomplished with a Curtiss military tractor biplane of the R-2 type, equipped with one of the new 160 horse power Curtiss motors.

In the latter part of October a competition was held for the Curtiss Marine Flying Trophy, and the best record was made by Oscar A. Brindley, who was in the air from 6.20 o'clock in the morning of October 27th until 4.20 in the afternoon of the same day, making an estimated mileage of 554 miles. Mr. Brindley traveled without passengers and flew over a circuit course from whose extent according to the rules of the competition 5 per cent was to be deducted. There were 12 entrants for this competition, representing five different aero clubs. The prize was \$1000. Brindley was an instructor in the United States Signal Corps Aviation School at San Diego, Cal., and used a Martin military 90 horse power V-type motor.

RECORDS. With the leading European aviators engaged in military operations it was not

strange that there should have been in Europe no important contests during 1915. In America, however, a number of new records were made, the most important of which were as follows: *Duration:* Aviator alone, Lieut. Byron Q. Jones, United States army, January 15, 8 hours, 53 minutes; aviator and two passengers, Lieut. Byron Q. Jones, United States army, March 12, 7 hours, 5 minutes. *Altitude:* Aviator and one passenger, Lieut. J. E. Carberry, United States army, January 5, 11,690 feet; aviator and two passengers, R. V. Morris, August 10, 8024 feet; aviator and three passengers, August 10, 8105 feet. *Distance for Hydro-Aeroplanes:* Aviator and one passenger, Lawrence B. Sperry, January 20, 60 miles. *Duration for Hydro-Aeroplanes:* Aviator and one passenger, Lawrence B. Sperry, January 20, 1 hour, 25 minutes. *Altitude for Hydro-Aeroplanes:* Aviator alone, Lieut. P. N. L. Bellinger, United States navy, April 23, 10,000 feet; aviator and one passenger, Lieut. H. Ter Poorten, August 31, 8330 feet.

FATALITIES. Had it not been for the European War, the list of fatalities would have been much smaller than usual. Naturally, a number of belligerent aviators were killed. The list included the famous French flyer, Alphonse Pegoud, killed in August. In the United States, Lincoln Beachey, an intrepid aviator, was killed at the Panama-Pacific Exposition on March 14th. Among other fatalities were: Cecil M. Peeli, killed while testing a new Grant biplane for the United States army at College Park, Md.; Ensign Melville M. Stolz, United States navy, killed on May 8th at Pensacola, Fla.; Captain George H. Knox, United States army, killed at Fort Sill, Okla., August 12th; Donald Gagon, killed at Erie, Pa., August 17th; and Lieut. W. K. Taliaferro, killed at San Diego, Cal., October 11.

AEROPLANE. See AERONAUTICS.

AFGHANISTAN. A monarchy of central Asia. Estimated area, about 225,000 square miles. The number of inhabitants cannot be stated definitely, but a plausible estimate puts it at about 5,000,000. The population of Kabul, the capital, is estimated at from 150,000 to 180,000; the city of Kandahar is supposed to have upwards of 40,000 inhabitants (one estimate is as high as 80,000), and Herat about 20,000. The Afghans, who are more or less turbulent tribesmen, belonging mostly to the Mohammedan Sunni sect, engage in both grazing and agriculture, producing for export cereals, lentils, fruits, live animals, wool, hides, and zhi. Silks, felts, carpets, and camels' hair goods are produced to some extent and exported. In the fiscal year 1913 (according to British Indian figures), imports of merchandise from Afghanistan in British India amounted to £847,656, and exports of merchandise from British India to Afghanistan, £1,666,802; in 1913-14, £860,000 and £1,013,000. Imports to Afghanistan from Bokhara are supposed to amount to about 4,000,000 roubles, and exports the same. Taxation is attended with dishonesty and extortion. At the head of the loosely organized government is the ameer (Habibullah Khan since 1901), whose annual revenues probably exceed 13,000,000 rupees: from the Government of India he receives an annual subsidy of 1,800,000 rupees. Afghanistan is in the sphere of British

influence, having by treaty no foreign relations except with the Government of India.

AFRICA. See articles on the various African countries; **ANTHROPOLOGY**; **ARCHÆOLOGY**; **EXPLORATION**; and **PEABODY MUSEUM**.

AFRICAN METHODIST EPISCOPAL CHURCH. See **METHODISTS**, **COLORED**.

AGLIARDI, ANTONIO. Roman Catholic Cardinal, died March 20, 1915. He was born at Cologno in 1832. After he had served as parish priest in his native town for twelve years he was sent to Canada as a bishop's chaplain, and on his return was appointed secretary to the Propaganda. Pope Leo XIII created him Archbishop of Caesarea in 1884 and in the same year and in 1887 he was sent on missions to India. In 1887 he was appointed secretary to the Congregation, and in 1889 Papal Nuncio at Munich, and was transferred to Vienna in the same capacity in 1892. The Hungarian government complained in 1895 that he was taking part in the ecclesiastical disputes which were dividing the country, and in the following year he was recalled, and elevated to the rank of cardinal, becoming the titular bishop of Albano. At the time of his death he was sub-dean of the Sacred College.

AGRICULTURAL BANKS. See **AGRICULTURAL CREDIT**; and **BANKS AND BANKING**.

AGRICULTURAL COLLEGES. See **AGRICULTURAL EDUCATION**.

AGRICULTURAL CREDIT. The very marked interest which has been shown during the past few years in proposals for facilitating loans to farmers continued during 1915. This was shown by the unusual volume of legislation on the subject. Various phases of the problem were considered at the annual session at Chicago of the National Conference on Marketing and Farm Credits. In Congress the Senate passed a bill establishing a bureau for lending to farmers \$10,000,000 to be appropriated from public funds and additional sums to be derived from the sale of government bonds. The House passed a bill creating land banks to make loans to farmers, funds to be derived from bonds backed by the government, but based on farm mortgages. This bill authorized the Secretary of the Treasury to purchase \$50,000,000 worth of these bonds yearly. Both of these proposals failed since the two Houses did not agree. The great volume of legislation led to protests by former Ambassador to France Myron T. Herrick and other leading students of the problem against hasty legislation which involved the pledging of government credit for the promotion of private business. Mr. Herrick pointed out that bad crops or financial depression might so involve the credits of State governments as to force heavy losses on the taxpayers. The line of sound progress he believed was not in the direction of State aid but rather through coöperation.

PROPOSED CONGRESSIONAL ACTION. A new bill believed to express the administrative viewpoint was completed by a sub-committee of the joint Congressional Committee on Rural Credits on December 24th, and was to be presented to that committee in January by Senator Henry F. Hollis. It combined features of the Hollis-Buckley Bill considered earlier in the year and the Fletcher-Moss Bill approved by the United States Commission on Rural Credits. It provided for a Federal Land Bank Board of five members to supervise 12 regional land banks

each with a capital stock of \$500,000. Each regional bank would make loans to farmers through local coöperative farm-land associations or joint-stock banks. The regional banks would obtain additional funds by selling bonds; and the charge to the farmer would be the interest on such bonds plus 1 per cent. These bonds would be backed by the regional banks, the local associations, the borrowing farmers, and the mortgages on their lands. Repayments of the loans would be by annual installments during not more than 36 years.

THE NATIONAL CONFERENCE ON MARKETING AND FARM CREDITS was held at Chicago, November 29-December 2, in conjunction with the National Council of Farmers' Coöperative Associations, the National Farmer's Union, the National Grange, and various State branches of the American Society of Equity. The general subjects, each treated by several speakers, were: the organization of agricultural coöperation; the standardization of farm products; standards and uniform packs, with special reference to the cotton problem; rural credits with special reference to land purchase; standardization and marketing with special reference to grading and inspection; financing farm business; and marketing the farm product.

THE FARM MORTGAGE BANKERS' ASSOCIATION OF AMERICA met in annual convention at St. Louis in October. All phases of the rural credit situation were discussed, and the board of governors of the association devoted considerable time to the formulation of suggested laws and of recommendations to the Joint Congressional Committee on Rural Credits.

FEDERATION OF JEWISH FARMERS OF AMERICA. This organization held its seventh annual convention at New York in December. It started in 1909 with 13 associations, and in 1915 had 84 branches in a dozen States. It carries out a coöperative purchasing plan which during these years has handled more than \$225,000 of business, with a saving of at least \$25,000 to the farmers. At the same time it has educated its members in the use of better seeds, fertilizer, and machinery. With it is associated the Jewish Agricultural and Industrial Aid Society which forms credit unions. In 1915 there were 19 such unions in four States with aggregate loans of \$210,292. These were the pioneer rural credit associations in this country and were modeled after the German societies. These organizations were instrumental also in forming coöperative fire insurance companies in New York and New Jersey. These had issued 555 policies covering \$1,185,000 insurance. The Federation had also established an agrarian bank in Sullivan County, N. Y., a coöperative creamery, and had carried out coöperative marketing plans.

LEGISLATION. The extensive agitation of the past few years has led to the enactment of considerable legislation by the States. The first law designed to facilitate the establishment of credit for farmers was a Massachusetts law of 1909 authorizing credit unions. Texas and Wisconsin in 1913 and New York in 1914 also authorized rural credit unions or coöperative credit associations and the Land Bank of the State of New York. But in 1915 more advanced steps were taken through the organization of competitive farm land banks under State supervision in Massachusetts, Utah, and Wisconsin.

sin; in Missouri, Montana, and Oklahoma systems of State loans were established; Massachusetts enacted further legislation regarding credit unions and coöperative banks, while North Carolina, Oregon, and Utah also authorized the organization of credit unions and coöperative banks. Bills for the creation of farm land banks were defeated in California, Indiana, Iowa, Michigan, and Nebraska. In Kansas and North Carolina building and loan associations were authorized to make long-term loans on farm lands. California created a commission to investigate rural credit schemes both at home and abroad. There was other legislation indicating the variety of proposals brought forward. Wyoming authorized the State treasurer to invest in irrigation bonds certain funds arising from the sale of State lands; in the same State a bill authorizing the investment of permanent funds of the State in farm mortgages failed of passage; in North Carolina a proposed amendment to the constitution authorized the State to create a loan fund the credit of which may be placed to individual farmers or credit associations; Montana authorized the State treasurer to issue bonds and from the proceeds make long-term loans to farmers secured by first mortgages, the administration to be carried out through county treasurers, and prompt payment of interest on the State bonds being insured by a guarantee fund provided by the State; Missouri and Oklahoma likewise authorized the use of certain State funds as initial capital for a system of long-term loans. Thus in Oklahoma a fund of \$2,000,000 was set aside to be loaned to farmers on mortgages of twice the value of the loans. An annual payment of 8 per cent of the principal was to cover interest and also amortize the principal in 23½ years.

The Missouri law establishing a land bank may be described to illustrate this type of institution. This bank is to be under the immediate administration of the State Bank Commissioner and a board of governors. Its initial working capital is \$1,000,000 appropriated from the funds in the State treasury. One-half of this may be loaned to farmers on the basis of deeds of trust at a net interest rate of 4.3 per cent. Thereafter additional capital will be secured through the sale of debenture bonds in series of \$500,000, the interest rate to the farmers being equal to that of the bonds. Loans to farmers are based on deeds of trust of 50 per cent of the appraised value of their farm lands; the entire State is to be appraised by expert appraisers and the bonds issued will not exceed the deeds of trust or 50 per cent of the appraised value of the land upon which loans are based. Whenever deeds of trust to the value of \$500,000 have accumulated a new series of bonds may be issued. The loans to individual farmers range from \$250 to \$10,000 and for terms of not less than 5 nor more than 25 years and an amortization scheme provides for the repayment of principal in fixed annual payments. The Missouri law does not become operative until Dec. 1, 1916. Meanwhile a referendum is authorized to determine the constitutionality of the appropriation of State funds for this purpose.

The Land Bank of New York was patterned after the Landshaft system of Germany. A large number of savings banks and loan associations with total assets of \$20,000,000, furnished the local basis for its operations. The

first bond issue of \$250,000 was to mature in 10 years and bore interest at 4½ per cent. The plan includes the sale of these bonds to investors and large financial institutions and the loaning of the proceeds to member associations at 5 per cent. Through these latter the funds reach the farmers in exchange for mortgages which become the basis in turn for further issues of bonds. The experience of the first year under this new organization showed that the greatest difficulty was not in bringing into existence the financial basis for farm loans but in arousing the interest of the farmers in taking advantage of the new scheme.

Bibliography. The most notable publication on this subject was Herrick and Ingalls's *Rural Credits* (1914), being a comprehensive account of European experience and new developments in America. The United States Department of Agriculture reprinted *Coöperative Credit Associations in Certain European Countries and Their Relation to Agricultural Interests* by Edward T. Peters, first prepared in 1892. See also **BANKS AND BANKING.**

AGRICULTURAL EDUCATION. The year 1915 marked considerable progress at the agricultural colleges of the United States, in their physical equipment, the development of their courses, and the strengthening of the teaching forces. Several of the colleges, notably Oklahoma, Oregon, and Utah, increased their entrance requirements to 15 or 16 credits, thus enabling a higher grade of college work. New courses were added for the preparation of agricultural teachers and for extension workers. The Utah Agricultural College celebrated its twenty-fifth anniversary in June with special exercises and a historical pageant.

The number of new buildings completed or under way was unusually large. At the University of California an additional building of the agricultural group, to cost \$250,000, was started. At the Iowa State College a plant industry building, of the same general type as the Hall of Agriculture previously built, was under construction. One of its wings was to provide for horticulture, landscape gardening, etc., and adjoining the building a range of greenhouses covering about half an acre were to be provided. Stockbridge Hall, a new agricultural building at the Massachusetts Agricultural College, costing with equipment \$210,000, was dedicated in October. It was the largest and finest building on the college campus.

In Nebraska, the Legislature provided \$700,000 for the erection and equipment of agricultural buildings during the ensuing four years. The erection of a new dairy building 64 by 141 feet, and with a wing 30 by 70 feet, was under way. The wing was especially arranged for handling butter, ice cream, and market milk. The building was to be thoroughly modern in every respect, and would have a refrigerating plant in the basement to provide cold storage facilities. Plans have been made for an agricultural engineering building as a part of the agricultural group. In New Jersey a commodious agricultural building was occupied about the middle of the year. This was located at the farm and accommodated the principal departments of the college, the experiment station, and the extension department.

The new soils building at the Cornell College of Agriculture was completed at a cost of

\$100,000. The new building was named Caldwell Hall, in honor of the late Dr. G. C. Caldwell, professor of agricultural chemistry in the institution for many years. A new animal husbandry building at the same institution, with a stock judging pavilion, 80 by 160 feet, was also occupied. The North Dakota Agricultural College completed a new fireproof dairy building; and a new horticultural and forestry building was dedicated at Ohio State University early in the year. The latter building is a two-story and basement fireproof structure, 60 by 250 feet, similar in general appearance to the main agricultural building.

The 1915 Congress passed an act setting aside four sections of land near Fairbanks in the Tanana Valley, Alaska, as a site for a territorial agricultural college and school of mines. A portion of this tract was occupied by one of the Federal experiment stations. No funds had yet been provided or plans made for the establishment of such an institution.

Arrangements were completed between Ohio State University and eight other colleges of the State for the five-year combination of arts and agriculture courses. Under this plan the first three years could be spent at a liberal arts college and the last two at the State University, the B.S. degree being conferred by the former institution at the end of four years, and the B.S. in Agriculture by the university at the end of the fifth year.

The preparation of men for various grades of agricultural teaching, for agricultural extension work, and for agricultural investigation in the experiment stations were subjects which received special attention at the annual convention of the Association of American Agricultural Colleges and Experiment Stations in 1915. The convention was held in August, at Berkeley, Cal. In the discussion of the training of agricultural teachers, it was shown that the efforts of the agricultural colleges were inadequate to the needs. In rural school teaching, the opening up of an avenue for the teachers outside the school room in conducting community work had been a great incentive to men to enter the field. For promoting advanced study by station men, a co-operative arrangement was entered into by several institutions for an exchange of station men, under which time and opportunity were afforded for study in special lines. The committee on agricultural instruction of the above Association dealt with college courses for the preparation of extension workers. The committee recommended that a considerable number of agricultural colleges should offer undergraduate courses for the purpose, and that a few should also make special provision for graduate instruction.

GRADUATE SCHOOL OF AGRICULTURE. The seventh session of the Graduate School of Agriculture was to be held in July, 1916, at the Massachusetts Agricultural College, under the auspices of the Association of American Agricultural Colleges and Experiment Stations. The school was to continue four weeks, and include courses of instruction under three general heads: (1) Factors of growth of plants and animals, (2) agricultural economics and rural sociology, and (3) fundamental problems of intensive agriculture. The Association recommended that college and station employees should be encouraged to attend the school and that no time should be deducted on account of such absence.

SECONDARY SCHOOLS. The movement for the introduction of agriculture into the curricula of public and private high schools continued as in preceding years. In 1915 there were 1677 such schools reporting agricultural courses, an increase of 263; the number of pupils in such courses was 34,367, or an increase of 4552 over the preceding year. An interesting experiment in secondary agricultural education was being tried in Atlantic City, N. J. The county board of education was attempting to provide (1) a winter school for young men and young women engaged on farms during the summer, (2) supplementary help on the part of the teacher in home projects, (3) definite instruction for adults in short courses, and (4) assistance to county superintendents in the introduction of agriculture.

An act of the State Legislature in New York authorized the board of supervisors of any county outside of the city of New York to establish a farm school for the purpose of giving instruction in the trades and in industrial, agricultural, and home-making subjects. Each school will receive annually from the State \$1000, and an additional \$200 for each teacher employed.

The Southern Conference for Education and Industry, at a four-days' meeting at Chattanooga, Tenn., in April, gave much attention to the subject of agricultural education, especially in the schools, and the fitting of agricultural instruction into the courses.

EDUCATIONAL WORK OF THE DEPARTMENT OF AGRICULTURE. The Division of Agricultural Instruction in the Office of Experiment Stations, now the States Relations Service, continued to follow and study the progress of agricultural education throughout the world, and beginning with January, 1915, established an *Agricultural Education Monthly*, pertaining to methods of teaching agriculture in secondary schools, and furnishing references and suggestions upon timely topics suitable for subject matter. Attention was given, among other things, to organizing the published matter, especially that in the bulletins and reports of the Department of Agriculture and the agricultural experiment stations, as a basis for teaching courses in agriculture in the rural and high schools. Such material was assembled and published, to be used for subject matter in teaching, with suggestions for methods of instruction. Outlines also were prepared of courses in agriculture to meet the needs of the schools of particular States, and school lessons were prepared on such subjects as corn, cotton, tomatoes, poultry, etc.

CANADA. A college of agriculture was established in April, 1915, in connection with the University of Alberta. Only advanced work, preceded by a two-year course at one of the agricultural schools, was to be given at the college. The increased appropriation under the Agricultural Instruction Act of Canada enabled the government of Prince Edward Island to make progress in organizing a complete system of agricultural education, correlated with the general school system. In Saskatchewan an agricultural instruction committee was appointed to advise on all matters pertaining to the scope and character of agricultural education in the public, high, and normal schools. The Department of Education in the province was arranging for the appointment of agricultural instructors at each

of the normal schools. The Department of Education in British Columbia decided to include agriculture as an optional subject in the high schools. Extension courses in agriculture were to be opened for boys and girls who were not regular students in the high schools.

OTHER COUNTRIES. The Greek government established an agricultural school at Halmiyras. A national institute of agriculture and veterinary science at Bogota, Colombia, and an auxiliary school of agriculture and animal husbandry, to be located elsewhere, were authorized. A school of agriculture was started at Artemisa, Cuba, and similar schools were to be provided in different parts of the island. An agricultural school for boys was opened on a plantation near San José, Costa Rica. A school for farm mechanics was provided in Argentina, and in China a new school of forestry was established in the University of Nanking.

AGRICULTURAL EXPERIMENT STATIONS. Evidences of a sharper division between agricultural experimentation and various forms of agricultural extension teaching, and of a closer confinement of the stations to the acquiring of new information, were the most notable features of the year 1915. This had grown largely out of the organization of agricultural extension divisions in each of the States, under the Smith-Lever Act. These divisions were to take over the lines of work in the past conducted by the stations to considerable extent, in the instruction of the farmer through lectures, correspondence, answering inquiries, local demonstrations, etc. The extension divisions were already relieving the station men of these demands upon their time and allowing them to concentrate more closely on experiments which would add new information or shed new light upon agricultural problems. This new service would in no way detract from the importance of the experiment stations or the need of their continued activity, but on the contrary would make them the more necessary to continued advancement, and would make their work more effective in bringing about improved methods and practice.

There was also a general movement to place the inspection work more largely under other agencies. This work had grown steadily in variety and extent, and in many instances the control or inspection provided by State laws had been placed with the experiment station because in many instances it was the only institution competent to perform such service and because it enjoyed the public confidence. There was a marked tendency to regard the stations as research institutions, and to relieve them from other duties and responsibilities in order that they might confine themselves quite definitely to experiments and investigations. The staffs of the stations likewise were differentiated to an increasing extent from the teaching force of the agricultural college and the staffs of the extension departments. This was a recognition, not only of the desirability of freeing the station men from distractions, but also that the requirements for investigation were of a special nature and differed from those for other lines of activity. The publications of the experiment stations constituted a separate series from those of the extension departments, and the bulletins and reports were being restricted more closely to popular and technical accounts of the work conducted by the respective stations. There also

was a considerable segregation of the strictly technical accounts of the investigation from the more popular reports, in order that each kind of literature might better reach the class for which it was especially intended. At a considerable number of stations research bulletins were being issued which contained the technical reports of investigations and researches made at the stations, such matters as were of more general interest to the agricultural public being published in the regular bulletin series. Technical accounts of investigations were being published to an increasing degree in research bulletins, in the scientific journals of the country, and during the year, in the *Journal of Agricultural Research*, published by the U. S. Department of Agriculture in coöperation with the Association of American Agricultural Colleges and Experiment Stations.

The demand for local experiment stations was constantly increasing, partly as a result of the closer touch into which the extension work had brought the farmers with the experiment stations. Every session of Congress saw a large number of bills introduced to establish and maintain experiment stations for given localities or for particular branches of agriculture. Few such bills had passed, because it was felt advisable not to duplicate the agencies in the States, and where necessary to provide for local assistance or special branches of inquiry through coöperation of the Federal Department of Agriculture with the State stations. Many of the States had themselves provided branch stations, to be conducted under the supervision of the central State station. One of the largest of these was the station for the citrus industry in California, recently located at Riverside. A tract of 465 acres of land was purchased by the University of California, with funds provided by the State, at a cost of \$55,000, and construction of a laboratory building to cost \$100,000 was under way. A Graduate School of Tropical Agriculture was to be conducted in connection with the station. The director of the Citrus Station was Dr. H. J. Webber, former professor of plant breeding in Cornell University, and a corps of specialists had been brought together.

In Minnesota the Legislature quite materially increased the appropriations for the branch stations located at Crookston, Morris, Grand Rapids, Duluth, and Waseca, and for the fruit breeding farm at Zumbra. The State of Montana appropriated \$59,000 for the maintenance of its central experiment station, \$14,000 for the dry farming and other substations, and \$4000 for the grain laboratory. In Texas, the appropriations for the branch stations had grown rapidly. Six years ago the only appropriation made for the station work in the State was \$5000 for operating two substations. In 1915 the Legislature granted \$140,582 for the first year of the biennium and \$135,000 for the second, to cover the work at ten substations and provide one new station. A new branch station was established in Washington, in the "Big Bend country" along the Columbia River. The Ohio Station was authorized by the State to purchase lands suitable for the growth of forest trees, at not more than \$10 an acre, and to manage such lands as State forests. An appropriation of \$10,000 was made to begin this work. Other appropriations to the station, including the maintenance of several branch stations, amounted

to \$272,543. In Tennessee, a tract of 569 acres of land lying convenient to the university and station farm was acquired, largely to meet the needs of the station work, which included breeding experiments with live stock. The cost of the tract was about \$140,000, \$125,000 of which was raised by county bond issue and the balance by public-spirited citizens.

The New Jersey Station occupied a spacious new agricultural building adjacent to the farm and plats, at the close of 1914. In Massachusetts a new agricultural building was completed and dedicated as Stockbridge Hall, a part of which will be used by the experiment station. A special building for the work in genetics was provided at the Illinois Station, and elsewhere numerous additions were made to the physical equipment of the stations to meet the growing needs of their work.

An interesting side light, as showing the esteem in which station men are held in agricultural communities, was furnished by the election of Dr. James Withycombe, for many years director of the Oregon Experiment Station, as Governor of the State at the last election, by the heaviest majority ever accredited a gubernatorial candidate in the State.

President Wilson set aside from the public domain a tract of land of about 29,000 acres in Eastern Idaho, to be known as the United States Sheep Experiment Station. This was to be used by the Bureau of Animal Industry of the Department of Agriculture for its experiments in sheep breeding and management for the western ranges, which were to be conducted on a scale suitable for open range purposes.

The total revenues available to the experiment stations during the year, including those maintained by the Federal government in Alaska, Hawaii, Porto Rico, and Guam, amounted to \$5,164,687.96. Of this amount, \$1,426,167 was received from the United States under the Acts of 1887 and 1906, and \$2,574,605 from State appropriations, showing that the States considerably more than met the Federal government in direct appropriations for this purpose. In addition, the Office of Experiment Stations had an appropriation from the Federal government of \$461,260, including \$35,000 for the Alaska Stations, \$30,000 each for the stations in Hawaii and Porto Rico, and \$15,000 for Guam Station.

The value of additions to the equipment of the experiment stations for that year was estimated at \$1,012,370. The total force of the experiment stations numbered 1852 persons, engaged in administration and inquiry. About half of these were also members of the teaching staff of the colleges. During the year the stations published 1330 annual reports, bulletins, and circulars, aggregating 25,265 pages. These were distributed to regular mailing lists aggregating over one million names.

In the Dominion of Canada liberal appropriations for agricultural work continued. For the year 1915-16, \$785,000 was appropriated for the maintenance of experiment farms. Among other items are \$550,000 for the development of the live stock industry, \$150,000 for the development of the dairy industries and other agricultural products, \$140,000 to enforce the seed act, \$113,000 for the fruit branch, \$25,000 for the National Biological Laboratory, \$20,000 for entomology, and \$15,000 for publications.

In December, 1914, the Colombian minister of agriculture decreed the establishment of a national institute of agriculture at Bogota, with an experimental farm attached. An agricultural adviser to the Government of Colombia has been appointed. The Chinese government, in the spring of 1915, set aside more than \$100,000 for the purpose of starting experiment stations. They are grouped in four classes, devoted respectively to cotton, sugar, afforestation, and pasturage. There had already been established three cotton farms, one sugar plantation, two forestry tracts, and three pasturage farms. An American cotton growing expert was employed. There was also a model ranch at Chu Chow in North Anhui. A tract of 919 acres at Trinidad, Luzon, Philippine Islands, was reserved from the public domain for the use of the Board of Agriculture as an experiment station and stock farm. The French ministry of agriculture established a plant-disease branch during the year.

AGRICULTURAL EXTENSION WORK.

Great progress has been made during the year in the organization and development of the system of coöperative extension work in agriculture and home economics provided for in the Smith-Lever Act of May 8, 1914. All the States assented to the provisions of this Act. A single college in each State was designated as the beneficiary of this Act, thus providing for a unified administration within the State. In several States where the college designated was not co-educational a coöperative arrangement for the work in home economics was made with the State college for women. In a few States having separate land-grant colleges for negroes a similar arrangement was made for work among that race.

In all the States the colleges created extension divisions or services and brought under them all their extension work in agriculture and home economics, whether carried on with Smith-Lever or other funds. In some cases laws or administrative regulations adopted years ago continued a confusing union of the extension organization with that of the experiment station, which should be definitely set apart as the research division of the agricultural college. In 37 States a separate officer was in charge of the extension work, usually with the title of "director"; in 11 States this officer was also director of the experiment station or head of the college of agriculture.

All the colleges receiving the benefit of the Smith-Lever Act entered into definite coöperative relations with the United States Department of Agriculture and with two exceptions were conducting all extension work in agriculture and home economics under the terms of a general "Memorandum of Understanding" with the Department, which was used as the basis for a great variety of coöperative project agreements. The Department brought all its extension work under the general charge of the State Relations Service (see *United States Department of Agriculture*) and was carrying on its administrative and coöperative functions with reference to such work through that Service.

The general lines of this coöperative extension system for the country as a whole were well marked out and established. The main features were (1) the county agricultural agents, (2) the boys' and girls' clubs, (3) the movable schools, and (4) the supporting work of the college and Department specialists. The States accepted

with remarkable unanimity one of the fundamental features of this system developed by the Department. An experience of more than 12 years had fully demonstrated the value of the county agent as a means of bringing to people on their farms and in their homes the results of practical experience and scientific research and securing the actual application of these results. Under the new conditions created by the Smith-Lever Act it was highly important to establish in each county permanent headquarters, in charge of a competent agent, who should act as the joint representative of the local community, the State college, and the Department of Agriculture. In this way the needs of the community could best be determined and the help of the State and the nation could most speedily and effectively be brought to the rural people. About half of the extension funds from Federal, State, and local sources were being devoted to the maintenance and development of the county-agent system. Over 1000 counties already had men as agents, and in the 15 Southern States there were in addition over 350 women agents. On the whole, these agents were very successful in winning the support and confidence of the farming people, and the tangible results of their work were very encouraging.

Since the agent could not deal altogether with individual farmers he was active in organizing groups of farm people through whom he might work. There were two types of such organizations. County associations, often called farm bureaus, were being formed. These were expected to take the initiative in securing local financial support for the agent, to join in his selection and appointment, and to aid him in his work. Many of these organizations included business and professional men, as well as farmers. Another type was the small community club. Where a considerable number of these clubs existed in a county they had often been confederated to form a county organization. The exact relations of these organizations to the extension system, the breadth and variety of their functions for the advancement of agriculture, and their most effective organizations were largely undetermined and they were to be considered as in the experimental stage.

The work of the county agents covered a wide range of activities relating to agriculture and home life. In the 15 Southern States during the year ended June 30, 1915, direct demonstrations of good practices covering practically every phase of Southern agriculture were conducted on 105,000 farms, and approximately 500,000 visits to farmers were made.

Much work was done in the prevention of animal diseases, many creameries and cream routes were established and instruction given in the feeding of dairy cattle and the marketing of milk. About 500 communities were organized and engaged coöperatively in some special work such as breeding of live stock, purchasing and selling of seeds, crops, etc. The women agents visited about 50,000 farm homes and gave practical instruction regarding household conveniences, preparation of food, care of poultry, marketing of eggs, canning of vegetables, etc. In the Northern and Western States, where the work was comparatively new, the agents were instrumental in forming 875 local organizations. They conducted 35,000 demonstrations with crops and live stock. They visited 76,000 farms, addressed

meetings attended by 1,200,000 people, and assisted in developing agricultural instruction in 4600 schools. About 72,000 farmers and their families attended short courses or movable schools.

The boys' and girls' clubs, developed by the Department and the agricultural colleges prior to the passage of the Smith-Lever Act, were continued and the scope of their work enlarged. In the Southern States this work was organically connected with the county-agent system; in the other States it was organized separately. Through it the extension agencies were brought into close touch with the State and local school officers and teachers, who coöperate in the formation and management of the clubs. About 260,000 boys and girls were enrolled in these clubs during the year. Leading activities were the competitive growing of crops, raising of pigs and poultry, canning of vegetables and fruits, and making of home gardens. The prize winners, and others in many cases, attended short courses at the agricultural colleges, often with the aid of funds contributed in the local communities.

The force of extension specialists, with headquarters at the agricultural colleges, was greatly enlarged and covered many lines of agriculture and home economics. These officers supplemented the field work of the county agents, furnished them advice and assistance, gave short practical courses of instruction in the rural communities, conducted demonstrations along special lines, prepared publications, addressed meetings of farm men and women, and answered inquiries. Specialists were also sent out by the Department of Agriculture to work with the extension agents. Among these, for example, were specialists in dairying, animal husbandry, use of hog-cholera serum, tick eradication, marketing of agricultural products, farm management, and the home canning of vegetables and fruits.

For the fiscal year beginning July 1, 1915, the total funds available for extension work from Federal, State, and local sources was nearly \$5,000,000. Of this, \$1,200,000 was derived from direct appropriations of the Department of Agriculture, and \$1,080,000 from the Smith-Lever Act, making the total Federal contribution \$2,280,000. This was met by approximately \$2,653,000 from sources within the States, including \$600,000 to offset the equivalent allotment of Federal Smith-Lever funds, \$499,000 from additional State appropriations, \$333,000 from college funds, \$944,000 from counties, and \$277,000 from local organizations and miscellaneous agencies. About \$2,500,000 was to be used for the demonstrations and other activities of the county agents. Much of their work bore directly on farm-home problems, but \$550,000 was allotted to distinctive work in home economics. More than \$300,000 was to be used for work among boys and girls. Nearly \$1,000,000 was to be devoted to the tasks of the specialists.

Farmers' Institutes covering from one to three days had long been important agencies for the dissemination of agricultural information in the United States. In 1914 the number of such institutes was 7740, with a total attendance of about 3,000,000. In about half the States these institutes were managed by the agricultural colleges. Since the passage of the Smith-Lever Extension Act the institutes connected with the colleges underwent considerable reorganization and in increasing measure were replaced by other

forms of extension work. In the 23 States in which the institutes were conducted by the State departments of agriculture the number of institutes held in 1915 was about 4000, with an attendance of 1,750,000, at a cost of about \$210,000. In Ohio and South Dakota the control of the institutes was transferred to the agricultural college.

In Russia the Agricultural Museum at Petrograd was conducting courses in agriculture for wounded soldiers in 83 hospitals near the city. The lessons were illustrated by lantern slides, charts, etc., and were followed by the distribution of pamphlets and other printed matter.

In Spain there was considerable activity in the promotion of excursions to special agricultural regions which were utilized for demonstrations, and also in the holding of "agricultural week" meetings.

In Germany the great women's unions of Saxony with the assistance of the minister of agriculture held in Berlin a course of instruction in agriculture and housekeeping with the object of teaching strict economy in the use of food and the prevention of waste made necessary by war conditions. The course was attended by about 200 teachers and presidents of women's societies. These were then sent to the rural districts throughout the province to organize classes of farm women and to instruct each from six to eight days regarding the best ways to economize in cooking, the feeding of live stock, and managing the entire farm in the absence of the husbands.

In Manitoba, Canada, "auto lecture tours" were organized. Each automobile carried five speakers, three on agricultural subjects, and two on home economics, together with charts and lantern slides. By this method the remote rural districts were reached. The meetings, held in rural school houses and churches, were attended by from 40 to 400 farmers. The Ontario women's institutes continued to increase in importance during the past summer. Meetings were held at 808 points, with an attendance of 202,504.

A system of extension teaching for farmers was undertaken by the Chinese Minister of Agriculture and Commerce, beginning with the establishment of an extension school for the training of lecturers and demonstrators, who were to travel throughout the country introducing improved methods of farming. This work was to be done in cooperation with the experiment stations recently provided.

AGRICULTURAL LEGISLATION. LEGISLATION IN THE UNITED STATES. Unusual interest was manifested in providing better rural credit facilities. A joint congressional committee was appointed in March to report by Jan. 1, 1916, a bill or bills for a system of rural credits. President Wilson in his message at the reassembling of Congress in December, 1915, also drew attention to the need for some provision for "adequate instrumentalities by which long credits may be obtained on land mortgages." Many bills aiming to accomplish this purpose were pending at the close of the year. Ohio appointed a committee to study rural credits, as well as cooperation, and California a commission on rural credits and land colonization. In Massachusetts, a farm-land bank was incorporated under a new law which permits long-time loans with farm mortgages as security and also the sale of bonds secured by these loans.

Missouri voters were to decide in November, 1916, as to the establishment of a State bank with similar powers. Minnesota and North Dakota were also to vote as to the use of State funds for farm loans. In Kansas, building and loan associations were authorized to issue rural credit shares, investing the proceeds in farm mortgages. Oregon authorized the formation of rural credit unions and cooperative State banks, and Massachusetts amended its credit union law, under which farm loans may be made. In South Carolina, the Commissioner of Agriculture was authorized to assist in placing loans on stored cotton, charging a commission for this service, and Texas required notes secured by cotton and grain in bonded warehouses to be accepted as negotiable property. Efforts to obtain Federal legislation, however, for increasing the value of warehouse receipts as security for loans by providing for the Federal licensing of warehouses for storing agricultural staples were unsuccessful. A State superintendent was appointed in North Carolina to organize and supervise credit unions, land and loan associations, and cooperative organizations. Colorado, Massachusetts, and South Carolina revised their laws pertaining to cooperative associations, and New Mexico authorized their establishment under prescribed regulations. In Oregon, farmers' associations were given the right to quarry lime.

The Federal appropriation for the study of marketing problems was increased to \$238,000. In California, a State commission market system was provided for handling agricultural, dairy, and fishery products. Idaho appointed a director of farm markets to cooperate with producers and consumers, as well as to investigate alleged frauds in the sale of real estate to home seekers, regulate advertising pertaining to colonization, maintain a farm labor employment bureau, list farm property for sale for the use of prospective buyers, and otherwise improve farm life conditions. Colorado and Maine provided for studies of marketing farm produce, and the latter also of the purchasing of farm supplies. In Colorado, Florida, and Kansas, commission merchants were required to obtain licenses, while in Michigan the law was amended. Public markets were authorized in Massachusetts communities of over 10,000, and their establishment or the designation of public market spaces was required. Farm and grove products sold by growers were exempted in Florida from license fees. Unfair discrimination by buyers against producers of farm products was specifically prohibited in Oregon and Wyoming.

A standard barrel was prescribed by Congress for fruits, vegetables, and other dry commodities handled in interstate commerce after July 1, 1916. This barrel contains 7056 cubic inches, except that for cranberries a smaller size is provided. California prescribed standard crates for apples, certified seed potatoes, and dairy products, with a system of State inspection as well as standard packages for most fruits and vegetables. Connecticut, Massachusetts, and Vermont established standard crates and packages for apples, and Colorado for small fruits and berries. Delaware enacted an apple grading and marking law. Montana amended its apple box law and New York and Washington their apple branding laws, the former by permitting increased variations from the standard. North Carolina and Tennessee required the marking of

fruits and vegetables to show the grower or packer, and Wisconsin the marking of all containers for farm produce to show the nature of the contents. Florida established a standard field box for citrus fruits. North Carolina promulgated standard grades for cotton and authorized a system of official graders. Michigan authorized the use of a State brand for high-grade butter, and Oregon and Washington further safeguarded the use of brands. Illinois, North Carolina, and Wisconsin provided for the registration of farm names.

The Federal Plant Quarantine Act was amended as regards interstate shipments by mail into States maintaining a system of terminal inspection of plant products by requiring, under certain conditions, the labeling of packages of plants and plant products, and their transmission to central points for inspection. Many of the States also adopted more stringent laws against the introduction and spread of both plant and animal pests. Florida passed a comprehensive plant quarantine act, and Nevada formulated extensive quarantine regulations for agricultural and horticultural plants, domestic animals, and bees. Colorado, Oregon, and Washington amended their laws as to county inspection. Kansas required the disinfection of grain sacks, and Minnesota of stock cars. Arkansas, Connecticut, North Carolina, and Oregon further restricted the running at large of farm stock.

New Hampshire provided for the inspection of insecticides and fungicides, Delaware of seeds, Idaho of Babcock apparatus, Michigan of galvanized wire fencing, New Jersey of bees and pasteurized milk and cream, Pennsylvania of lime, and Missouri and Montana of grain and its grading in elevators, warehouses, etc. New Mexico adopted a new stallion registration law. Amendments were adopted in Minnesota, New Hampshire, New York, and South Carolina as to fertilizer laws; in Connecticut, Illinois, Kansas, Michigan, Nevada, New Hampshire, and South Carolina as to feeding stuffs; in Indiana, Massachusetts, and Montana as to nursery inspection; in Nebraska, New Hampshire, Tennessee, Washington, and Wisconsin as to seed inspection; in Nebraska as to weed control; and in California, Michigan, Montana, Nebraska, Ohio (repeal), and Wisconsin as to stallion registration. Maine provided for the inspection of milk and dairy products, and Massachusetts prohibited dairy inspectors from charging fees for their work. Connecticut and Florida regulated the operation of live stock insurance companies, and New York amended its laws as to nursery stock sales.

Certain public lands in Alaska were set aside by Congress for the eventual support of a Territorial agricultural college and school of mines. The Federal Smith-Lever Act of 1914 was formally accepted by the several States, and supplementary legislation enacted in many of them to facilitate the development of extension work. New York and North Dakota authorized counties to establish agricultural and training schools, the former also granting State aid. Florida and Kansas permitted boards of education to purchase land for teaching agriculture, and the former State required teachers to have special training in the subject. Nebraska, Ohio, and Texas also amended their laws as to agricultural education.

A State department of agriculture was estab-

lished in Wisconsin, centralizing much of the demonstration and inspection work. Missouri reorganized its board, and Ohio abolished its agricultural commission and reestablished its board of agriculture. Pennsylvania established a State commission of agriculture and Delaware a commission on milk supply. Florida established Farmers' Day as a legal holiday, California a bird and arbor day, and North Carolina an arbor day. In South Carolina, the Commissioner of Agriculture was empowered to distribute inoculating material for leguminous crops. Montana counties were authorized to sell seed grain to needy farmers, taking a lien on their property to secure payment. North Carolina authorized the sale of lime to farmers at cost, as well as the use of convict labor in lime-crushing plants and on county demonstration farms. Porto Rico provided for the sale of small holdings to laborers.

FOREIGN LEGISLATION. An agricultural economic commission was appointed in Canada to study questions related to the production, marketing, and distribution of farm products, including the encouragement of education, coöperation, transportation, and storage of products, colonization, and the securing of capital. In British Columbia, an agricultural credit commission was established to lend money to individuals or associations for developing agricultural holdings. Alberta levied a special tax on uncultivated lands suitable for agriculture with a view to hastening their development. In Manitoba, municipalities were authorized to borrow money for loans to farmers for the purchase of seed grain. Saskatchewan required the fulfillment of contracts as to warranties and the maintenance of uniform prices for farm implements and repairs. A stock inspection act was passed in Alberta and apiary inspection provided in New Brunswick. Saskatchewan amended its laws as to coöperation and the granting of hail insurance.

The export of all kinds of feeding stuffs, fertilizers, agricultural seeds, farm implements, and most food materials was prohibited in Great Britain, and a similar embargo as to food products was issued in France. Great Britain also passed a live stock act to remain in force for one year after the close of the war, under which the Board of Agriculture and Fisheries may prohibit or restrict the slaughter of all animals, except male lambs, or the sale of meat from immature animals. France established a commission on farm labor, and reorganized its phytopathological service, coördinating the work of existing services and institutions. A board of agriculture was established in New Zealand and a reorganization of agricultural activities effected in Portuguese East Africa.

AGRICULTURE. In spite of the greatly disturbed condition of the world during the year, the 1915 world's wheat crop largely exceeded that of any previous year and surpassed that of 1914 by several hundred million bushels. The yields in every important country except France and Austria exceeded those of the previous year. More than half of the increased production was ascribed to an expansion of wheat growing in non-European nations. The acreage sown to wheat on the Continent of Europe was reported to have fallen short of that of 1914 by from two to three million acres.

This reduction was confined mainly to Russia, France, and Rumania. The wheat production of France, the second important wheat producer in Europe, was estimated to represent a shortage of approximately 60 million bushels, which would necessitate importing about a million bushels.

In the United States the wheat crop was the largest ever grown, passing the billion bushel mark for the first time. No country had ever equaled it, and it represented about one-fourth of the entire world's production in 1915. The total acreage of 60 million acres in wheat was equivalent to the combined total area of the six New England States plus New York and Pennsylvania. In Canada, British India, and several other important wheat producing countries there were either record or near record crops.

The rye, barley, and corn crops of the northern hemisphere each represented a considerable increase over 1914. The estimate of the International Institute of Agriculture for all cereal crops in the northern hemisphere was 108 per cent of normal, or more than enough to meet the needs.

In the United States the corn crop was the second largest ever raised, being 16 per cent higher than in 1914 and 14 per cent above the average for the five preceding years. The quality, however, was low. There were record crops of oats, rye, barley, rice, and hay, in addition to the wheat crop already mentioned. The potato crop declined as the season advanced, on account of blight and rot, but was up to the five-year average. Tobacco production was slightly larger than in 1914 and about 4 per cent above the five-year average. The cotton crop was a short one, estimated at a little over 11 million bales, owing to a 15 per cent reduction in areas and a 20 per cent poorer yield. The quantity of cotton carried over from the 1914 crop was considerably larger than usual. The high farm prices of products gave the principal farm crops an aggregate value of \$5,568,733,000, the highest ever attained by American agriculture. It was estimated that the value of minor crops and animal products would bring the total up to 10 billion dollars.

The total agricultural exports of the United States in the fiscal year ended June 30, 1915, practically the first year of the war, were \$1,470,000,000, representing an increase of \$356,000,000, or 32 per cent over those of the preceding year, and of \$433,000,000 or nearly 42 per cent over the average of the five years, 1910-14. As compared with the preceding year, exports of horses and mules increased from 4 to 77 million dollars, meat and dairy products from 146 to 220 million, wheat and flour from 142 to 428 million, corn and corn meal from 7 to 39 million, oats from 1 to 57 million, and barley from 4 to 18 million dollars; while cotton decreased from 610 to 376 million, and tobacco from 54 to 44 million dollars. These products comprised nearly nine-tenths of the total agricultural exports.

An interesting statement by the Department of Agriculture, showing the extent to which the principal farm crops of the world were transported from the countries of their origin to other countries, based on the estimated value per year, was as follows: Cotton, \$1,127,000,000; wheat and flour, \$744,000,000; raw wool,

\$480,000,000; hides and skins, \$392,000,000; coffee, \$386,000,000; sugar, \$382,000,000; rice, \$278,000,000; barley and malt, \$220,000,000; corn and meal, \$210,000,000; unmanufactured tobacco, \$192,000,000; butter, \$173,000,000; tea, \$143,000,000; rye and flour, \$125,000,000; and oats, \$102,000,000.

SPECIAL CROPS AND INDUSTRIES. The Manila hemp (abaca fibre) crop of the Philippine Islands was estimated at 1,030,000 bales or about 40,000 bales more than in 1914. The prevailing prices were lower than usual on account of the war, and as a result it was expected that the crop would net some \$2,000,000 less than it ordinarily would. The final official forecast for the 1915 jute crop of India placed the area under cultivation at 2,377,316 acres and an estimated upturn of 7,428,733 bales of 400 pounds each. This represented a decrease of nearly 30 per cent in the area as compared with 1914, which was the second largest, and a production of about 2½ million bales less than the previous crop. Soy bean culture was extending in the United States, especially in the Southern States, where the cotton mills furnished a market for the beans, which are crushed for oil. The cake left from the expression of the oil is a highly nitrogenous stock feed. The beans are also ground and fed to live stock, and the vines are utilized.

Kaoliang, a Russian early grain sorghum introduced by the United States Department of Agriculture, was tested as a dry-land crop and gave promising results, notably in South Dakota. It is drought resistant, with a comparatively low moisture requirement, and had produced satisfactory yields in the driest seasons. Both seed and stalks were utilized for feed.

The special campaign inaugurated in 1914 by the Philippine Bureau of Agriculture for the greater growing of food crops was productive of good results in many sections of the islands. Secondary crops, including corn, camotes, gabi, mongo beans, cowpeas, and the like, were grown on quite a large scale. In some sections, it was reported, practically the entire population had been placed beyond dependence upon the importation of foodstuffs.

Coffee imported into the United States in the calendar year 1914 exceeded one billion pounds, a record only made twice before. The value of the import was \$150,000,000, or \$25,000,000 less than in 1912 when an unusually high price prevailed. Brazil was the chief source of supply, over three-fourths of the total amount coming from that country. The total coffee export from Brazil in the fiscal year ending July 31, 1915, was 13,401,515 bags, as compared with 14,533,581 in the previous year. The United States continued the chief purchaser, taking 5,880,619 bags, France being a second with 1,808,815 bags. No shipments were made to Germany, Austria, or Belgium, which in the preceding year took an aggregate of 3,431,506 bags. An increasing share of the coffee consumed in continental United States was produced in Porto Rico and Hawaii. In 1914, 2,793,052 pounds were brought in from Porto Rico, as compared with 372,427 pounds in 1894. Hawaii furnished about 3½ million pounds. The Porto Rican and Hawaiian coffees brought higher prices than the South American. The United States is the world's largest consumer of

coffee. The consumption is now reported at 10 pounds per capita, having nearly trebled in the past 50 years.

The production of fired tea in Japan in 1914 amounted to 71,345,944 pounds, valued at \$7,-373,320.

Provisional estimates for the world's production of raw silk during 1914 were 48,215,000 pounds, as compared with the revised statistics of 60,230,282 pounds in 1913 and 59,447,641 pounds in 1912. The apparent falling off in 1914 was not thought to represent a diminished production, but to be due to the war having almost completely suppressed arrivals of raw silk in France from Turkestan, Persia, and the extreme Orient, from which the supply was largely derived. More raw silk was brought into the United States in 1914 than in any previous year. Japan supplied a large and increasing proportion of the raw silk consumed by American factories. Ten years ago she supplied more than half and in 1914 nearly three-fourths of the total used.

Ostrich farming in South Africa was reduced to a very low ebb as a result of the remarkable decline in the feather industry. Birds were reported early in the year to be dying by thousands for lack of food and attention. The market for feathers improved somewhat during the year, but under the changed conditions a greater amount of the land is being put under cultivation. In times of prosperity that country exported about \$25,000,000 worth of feathers. A similar fate has overtaken the industry in the United States.

THE WAR AND AGRICULTURE. The war in Europe had a far reaching effect upon agriculture and agricultural labor, and the prime importance of producing and maintaining adequate food supplies made farming the object of unusual public attention. In Great Britain the government took unusual measures to foster agriculture and to prevent the depletion of live stock and breeding animals. At the outbreak of the war an agricultural consultative committee was appointed in England as a permanent committee, to which the Board of Agriculture looks for advice in relation to many agricultural subjects. In June the president of the Board of Agriculture also appointed a departmental committee to consider and report what steps should be taken to maintain and if possible increase the production of food in England and Wales, on the assumption that the war might be prolonged beyond the harvest of 1916. The committee made an interim report in July, restricted to wheat growing, in which it proposed a government guaranty of 45 shillings a quarter on wheat (approximately \$1.35 a bushel) for four years, commencing after the harvest of 1916. The government, however, decided not to establish such a guaranty. Similar committees were appointed in Scotland and Ireland. Another departmental committee dealt with the question of fertilizer supplies, studying the means of maintaining adequate supplies for the use of farmers in the United Kingdom. A system of district and county war agricultural committees was provided in England as a means of maintaining a closer contact with the farmers and aiding them in all possible ways.

The English government made forceful appeals to the farmers to increase the size of their crops to the utmost, to maintain their flocks

and herds in spite of the labor and feed situation, and to do their best to keep up the supply of food "as a special war service" to their country. It was suggested that they plow up the poorest of the permanent pastures, shorten the period of grass and clover in rotations, improve the remaining grass land so that it would carry more stock, cultivate cash crops and other home grown feeds, and reduce the acreage of bare fallow wherever possible. Circulars were issued by the Board of Agriculture warning them to store their crops with the greatest care, to save all material which could be used as fodder, and to waste nothing. Month by month the publications of the Board contained notes on the relative value of feeding stuffs in proportion to their cost, to aid in economical selection; and unusual importance was attached to the use of tested seed to insure larger crop returns, and to the control of insects and plant diseases. Attention was turned to utilizing the large areas of land not ordinarily employed for agriculture, and a canvass showed the very considerable extent to which golf links were being used for grazing sheep, cattle, and horses, and in some cases for making hay.

In the one item of hay, the requirements of the army amounted to approximately one-fourth of the entire annual production. The War Office required farmers to make returns as to the stocks of hay in the country, urged them to offer their supply freely, and gave notice that where it was unreasonably withheld the powers of requisitioning hay would be employed.

To meet the requirements of British soldiers in hospitals at home and in France, a supply of 300,000 eggs a week had been needed. This was maintained by a National Egg Collection for the Wounded, with branches throughout the country, which made urgent appeals for assistance from time to time, in view of the difficulty experienced in securing the necessary supply.

The shortage of labor, the increased cost of feeding stuffs, and the high prices of all classes of live stock necessitated special measures to conserve the supply of meat and dairy animals. The British government passed a law prohibiting the slaughter of calves or immature stock, or animals in calf or in pig. To encourage the breeding of horses orders were given by the War Office to avoid as far as possible the purchase of mares and on no account to purchase by impressment any mares to be used the coming season for breeding. The War Office also arranged for the return to England of mares no longer suitable for army use but which were of good type for breeding purposes.

The address of the president of the Agricultural Section of the British Association, at the annual meeting in September, dealt with the subject of "Farming and Food Supplies in Time of War," showing the share contributed by British agriculture to the national food supply, and the extent to which it has assisted in making good the lack of supplies cut off by the war. There was an increase over the normal production during the first year of the war. Very few agricultural shows were held in any part of Great Britain.

On the Continent the effects of the war were even more pronounced. Women cultivated the fields and harvested the crops to an unusually large extent, and every precaution was taken to avoid waste of food and fodder and to utilize

new sources. In France measures to maintain the live stock were adopted, similar to those in Great Britain. These prohibited the requisition of cows in calf or giving milk, or brood mares in foal or with foal, male breeding stock which had won prizes or belonged to livestock improvement associations, registered stock or its offspring, heifers, and work oxen. In some countries the governments were empowered to take over the supplies of wheat and flour, and late in the year the Canadian government commandeered 16,000,000 bushels of wheat for the British government. These measures were taken, not only to insure sufficient and regular supplies, but to prevent speculation and control prices. In Australia the government assumed control of the frozen meat export, in the interest of Great Britain. In Germany, transactions in these food commodities were forbidden early in the year.

Such measures were not confined to the warring nations. The Government of Portugal took over the entire wheat crop and authorized the import of nearly 7½ million bushels of wheat through its War Office, in order to regulate the supply and price of bread. To stimulate production in that country a large number of prizes were offered for the best wheat crops on 5 and 20 hectare areas.

Methods were devised in Germany to produce feed from straw, peat, and various other coarse materials through the action of fungi. Many substitutes for oats were being experimented with, besides the sugar feed containing 10 to 20 per cent of cut straw. The use of dried beets had become extensive in Germany. Dried chicory roots, called "chicory crumbs," were found to be an excellent substitute for oats.

France was taking up the matter of remunerating the farmers for war losses. A law passed at the close of 1914 established the right to compensation for material loss caused by war, and in February, 1915, valuation commissions were organized. Special rules were formulated in regard to damage to farms. These applied to agricultural machinery and equipment, cattle, agricultural products and standing crops, vineyards, hop yards, orchards, gardens, nurseries, drains and canals, the restoration of fields, and permanent depreciation of the soil through covering it with infertile layers. Special rules also were laid down in regard to damage to forests.

AGRICULTURAL LABOR. Reference has been made to the natural effect of the war on agricultural labor. In England about 15½ per cent of the farm laborers had joined the forces by the beginning of 1915. The shortage was keenly felt, and wages increased. The government exempted from enlistment farm laborers of various kinds, teamsters, shepherds, engine drivers, and operators of farm machinery, old age pensioners were permitted to labor, and special leave was granted postmen to work in the harvest. The army council announced that a limited number of soldiers accustomed to team work would be furloughed to assist in the fall plowing and other work. Partially disabled soldiers were placed on farms as they became fit, and the utilization of Belgian refugees was taken up. Strong appeals were made to women to offer themselves for light farm work as "a national war service." Thousands of women were reported to have responded, many of whom

were already in training. The more extended use of labor-saving implements and machinery was advocated, and to enable their purchase attention was turned to the formation of coöperative farm implement societies, on the plan of those in Ireland. Local demonstrations of such machinery were held.

On the Continent prisoners of war were used quite extensively in farming. In Germany large numbers were employed with satisfactory results. In France they were assigned for the purpose in gangs of 20, the farmers to feed and lodge them and pay them 40 centimes per man per day. That country also arranged to turn over to the Department of Agriculture 20,000 navy conscripts to be distributed where labor was most needed.

The farm labor problem in Canada was a vital one, according to the Commission of Conservation. The supply was insufficient and much of it had not had sufficient training to do farm work economically. The unequal distribution of work through the year also prevented the economical use of labor, as did also the employment of inadequate machinery and implements on the farm.

The United States Department of Labor undertook to assist farmers in securing laborers and especially harvest hands. The coöperation of the Post Office Department and the Department of Agriculture was had in the enterprise. Approximately 50,000 men were directed to employment through this means, and the farmers were enabled to gather their wheat harvest in due season.

GERMAN BOARD OF AGRICULTURAL ADVISERS. Mention has been made of the temporary agricultural committees appointed as an outgrowth of the war situation. In this connection it may be noted that Germany had a permanent Board of Agricultural Advisers, dating back to 1872, which was in position to render the government assistance in time of peace or war. This board, known as the *Landwirtschaftsrat*, is a semi-official body, having the general object of improving the agricultural conditions of the Empire by suggesting needed measures or legislation. It is composed of representatives from the various German states and colonies, in proportion to their number of votes in the federal council (*Bundesrat*). Meetings are held at the call of the president of the board, as necessity requires. Its work during the war was reported to have been of the utmost importance in conserving the national food supply, and in advising legislation and other measures for promoting crop production.

AGRICULTURAL MACHINERY. In spite of the increased interest in agricultural machinery in Europe to meet the shortage of labor, the difficulties of import have limited the increase in its use. In Russia this difficulty led to movements to establish local factories for its manufacture. The exports of American agricultural implements during the fiscal year 1915 totaled approximately \$10,000,000 as against \$40,600,000 in the high record year of 1913 and a yearly average of \$29,000,000 for the decade ended 1915. The loss of trade fell most heavily upon sales to Europe, but there were also decreases in shipments to Argentina, Canada, and various countries of Africa. The European war was doubtless the dominant factor in this falling off. Thus the export of implements to

European Russia, usually the greatest foreign market, practically ceased, as did also those to Germany, while huge losses occurred in sales to France and other European countries.

A comparison of the entries of farm machinery at the first show of the Royal Agricultural Society of England in 1839 with those at the show in 1915 gives an idea of the tremendous development in this line. At the first show 75 years previously, only 16 mechanical appliances were shown, consisting of a grubber, a mold-board plow, two subsoilers, two cultivators, a swing plow, one horse hoe, one chain harrow, etc. They were typical of the best and most advanced farm machinery of that period. The exhibits of farm machinery in 1915 numbered 4230, and in addition 19 new implements entered for silver medals. These exhibits included planters, seeders, reapers, binders, and other harvesting machinery, motor plows, traction engines, etc., besides the simpler forms of implements.

Activity was reported in China in the invention of various agricultural implements and machines for saving labor. In the United States and Canada attention has been attracted to electricity as a source of power for operating labor-saving machinery, and especially threshing outfits. With electrical energy at five cents per kilowatt-hour, the operating expense was estimated at considerably less than that with a steam engine. A trial in Ontario showed a saving of nearly 40 per cent as compared with steam, basing electrical energy on the above figures.

BINDER TWINE. Early in the spring the supply of binder twine in the United States became threatened through the closing of the port of Progreso, Yucatan, by the Mexican authorities. The supply of twine for the United States and Canada is made in the former country, requiring about 200,000 tons of sisal hemp a year, derived in large part from Yucatan. This supply is not accumulated at the factories but is brought in regularly through the year. Grain is harvested so largely by means of the binder that an adequate supply of binding twine is necessary to a successful harvest of the crop. This led the government to exert pressure which opened the port of Progreso to United States commerce, and a gunboat carried gold to the port to pay for the sisal, so that the danger for a time feared was averted.

A serious shortage of binder twine in Russia resulted from the war conditions and threatened the grain harvest. The supply was purchased largely from American manufacturers. To relieve the situation the Russian government purchased a million dollars' worth of twine, payment being made in New York and transportation arranged by the Russian government.

CHINESE INDIGO. The shortage of the supply of synthetic indigo on the markets of the world as a result of the war in Europe, and the consequent high prices, led to a revival of the native cultivation of indigo in various parts of China. Indigo production is one of China's oldest industries. It continued in some parts in spite of the synthetic product, and foreign dyes were said to be comparatively rare in many districts. Ordinarily, synthetic indigo can be delivered well into the interior of China at lower cost than the native product. In 1913

it was reported that artificial indigo to the value of over \$7,000,000 was imported. In 1915 it was expected that the natural product raised in China would not leave a surplus for export, but a continuation of high prices would lead to a great revival of the old-time industry.

EGGS. The extent to which eggs were imported from China into the United States was surprising. The duty on fresh eggs was removed by the tariff act of 1913 and that on other eggs much reduced. In 1914 the Chinese imports consisted of \$1,089,164 worth of fresh eggs, and over a half million dollars' worth of yolks and frozen eggs. Several of the largest bakers' supply houses of the United States contemplated erecting factories in China to manufacture dried and desiccated eggs. One such plant had already been put in operation.

WEEDS. Attention was called to the alarming spread of weeds in Canada, where it was reported that people had been forced to leave their farms because of the invasion of weeds. The Commission of Conservation explained this by the uncommon difficulties of the climate and the large acreage the farmers were attempting to cultivate with short labor. "In consequence," it says, "we have the largest amount of weeds per acre of any country in the world." The use of various chemicals as sprays in controlling weeds had been tried with success. In view of the drain of weeds on the moisture and fertility of the soil, and the finding that one of the chief benefits of cultivation is keeping down weeds, economical weed control was highly important. Sodium arsenite applied as a spray had been found one of the most effective weed killers, and in some sections had proved an economical and practical success, both in cultivated fields and in ridding grass lands of noxious weeds. The cost of the spray was about \$2.50 per acre. In Hawaii it was used on the pineapple plantations for five years, and on one large plantation resulted in a saving in labor of \$100,000 a year.

UTILIZING WASTE PRODUCTS. A striking instance of the utilization of waste agricultural products was furnished by the case of cherry and apricot pits and raisin seeds. These products, formerly thrown away, were being used on quite an extensive scale for making alcohol, volatile and fixed oils, and other products. About 1600 tons of cherry pits or stones were being produced in the United States annually. The kernels from these yielded approximately 21,000 gallons of sirup from which 5000 gallons of alcohol and 85,000 pints of jelly were made, together with large quantities of volatile and fixed oils. The annual output of apricot pits was some 5000 tons, the kernels of which yielded 350 to 400 tons of fixed oil and 18,000 to 22,000 tons of volatile oil. From the annual crop of 3000 to 4000 tons of raisin seeds were derived large quantities of sirup from which from 41,000 to 54,000 gallons of alcohol were made, and the residues yielded many thousand gallons of fixed oil used for paint and soap making, and 330 to 445 tons of tanning extract, suitable for tanning leather. Refuse tomato seed was utilized in some countries, notably Italy, for the extraction of oil used for soap and other purposes. Waste grape seeds, a by-product of wine making, were likewise used for extracting oil.

INSANITY ON THE FARM. In view of current

opinion regarding the prevalence of insanity on the farm, and especially among farm women, the report of an inquiry into this subject by the United States Bureau of the Census is interesting as furnishing some exact data. The number of insane admitted to hospitals the country over in 1910, per 100,000 population, was 94.3 males and 77.5 females in urban communities, and 45.2 males and 37.3 females in rural communities. This shows the current view to be without foundation.

INTERNATIONAL INSTITUTE OF AGRICULTURE. With the progress of the war the difficulty of carrying on the work of the Institute increased. The delegates from the belligerent countries returned home, and by the time Italy entered the war nearly half of the present staff, ordinarily consisting of about 100 members, had left Rome. Special efforts were made to insure the issuance of the regular bulletins and statistical tables, and it was hoped in this way to keep the current work up to date, with a view to resuming the functions of the Institute with full vigor on the conclusion of peace. Difficulty was experienced in securing crop statistics from the countries at war. The estimates were based to the extent of about 80 per cent on definite returns, the balance being supplied on the basis of averages of previous years and reports of general conditions.

NEW LITERATURE. The following are some of the books of the year: H. J. Waters, *The Essentials of Agriculture* (Boston and London, 1915), a general treatise covering soils and fertilizers, maintenance of fertility, breeds of live stock, the business aspects of farming, and mechanical power on the farm; H. W. Wiley, *The Lure of the Land* (New York, 1915), a popular treatment of some of the principles and practices of the new agriculture, illustrated from the author's experience; C. W. Stoddart, *Chemistry of Agriculture* (Philadelphia, 1915), a book for class-room and reference; E. J. Russell, *Soil Conditions and Plant Growth* (London, 1915), a revised edition of an excellent résumé of the theory of soil management and plant growth; A. H. H. Matthews, *Fifty Years of Agricultural Politics, 1865-1915* (London, 1915), a historical sketch of the efforts of the British Central Chamber of Agriculture to affect legislation respecting agricultural matters; F. I. Anderson, *Electricity for the Farm* (New York and London, 1915); J. B. Morman, *Principles of Rural Economics* (New York, 1915); and F. E. L. Beal, *Some Common Birds Useful to the Farmer* (U. S. Dept. Agr., Farmers' Bul. 630, 1915).

Various cereals, etc., referred to above are treated in separate articles, each under its own name.

AGRICULTURE, INTERNATIONAL INSTITUTE OF. See AGRICULTURE.

AGRICULTURE, UNITED STATES DEPARTMENT OF. See UNITED STATES DEPARTMENT OF AGRICULTURE.

AIRSHIPS. See AERONAUTICS.

ALABAMA. **POPULATION.** The estimated population of the State on July 1, 1915, was 2,301,277. The population in 1910 was 2,138,093.

AGRICULTURE. The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1914-15 were as follows:

		Acreage	Prod. Bu.	Value
Corn	1913	3,900,000	66,300,000	\$45,747,000
	1914	8,264,000	55,488,000	44,890,000
Wheat	1915	100,000	1,200,000	1,500,000
	1914	81,000	403,000	508,000
Oats	1915	600,000	11,400,000	7,182,000
	1914	390,000	8,580,000	5,920,000
Rice	1915	300	8,000	6,000
	1914	200	6,000	4,000
Potatoes	1915	20,000	1,600,000	1,440,000
	1914	18,000	1,422,000	1,436,000
Hay	1915	250,000	a 362,000	4,489,000
	1914	220,000	288,000	3,974,000
Tobacco	1915	200	b 100,000	22,000
	1914	200	140,000	39,000
Cotton	1915	3,400,000	c 1,050,000	55,734 000
	1914	4,007,000	1,751,000	56,118,000

a Tons. b Pounds. c Bales of 500 pounds gross weight.

MINERAL PRODUCTION. The coal production in the State in 1914 was 15,593,422 short tons, valued at \$20,849,919. This was a decrease as compared with 1913 of 2,085,100 tons in quantity and \$2,223,805 in value. The decrease of the output was general throughout the State. The markets for Alabama coal were affected by the low price of petroleum in the Southern States, by increased water-power development, by the competition of coal from Kentucky and Illinois in the markets of Louisiana and Mississippi, which are normally supplied by Alabama, and by a decrease in the bunker trade, which suffered because of the cutting-down of exports of cotton in the summer. The iron ore mined in the State in 1914 was 4,838,959 tons. The quantity marketed was 4,514,926 tons, valued at \$5,727,619. This was a considerable falling off from the production of 1913, which was 5,333,218 tons, valued at \$6,648,569. Alabama ranks third of the States in the production of iron ore. The total value of the mineral production in 1914 was \$30,879,288 compared with \$39,660,545 in 1913.

FINANCE. At the beginning of the fiscal year, 1914, there was a balance in the treasury of \$99,267. The receipts for the fiscal year amounted to \$6,607,001, and the disbursements to \$6,575,569. The bonded debt of the State at the end of the year was \$9,057,000.

EDUCATION. The total school population of the State in 1915 was 774,976. There was an enrollment of 464,345 in the public schools, and an average daily attendance of 291,890. The total number of teachers, both male and female, numbered 8678. The average salary for male teachers was \$382 per year, and of female, \$312. The total school expenditures for the year were \$4,776,807. The Legislature of 1915 passed a number of important measures relating to education. There was created a commission to be known as the Illiteracy Commission, composed of five persons, including the State Superintendent of Education. The committee was to collect data relating to adult illiteracy in the State, and make recommendation for improvement in the conditions. A second measure authorized women to serve on boards of education in cities, counties, and towns. The employment of public school teachers of less than seventeen years of age was prohibited, and provision was made for schools having less than 10 pupils. Private, denominational, and parochial schools are required to make school reports. A limited compulsory education act was passed. This requires an attendance at school of all children between the ages of 8 and 15, at least 80 days

during each year, with certain exceptions and conditions. Provision was made for the holding of teachers' institutes in the State.

CHARITIES AND CORRECTIONS. The State charitable and corrections institutions include insane hospitals at Tuscaloosa and Mount Vernon, the Confederate Soldiers' Home at Mountain Creek, Alabama Industrial School for White Boys at East Lake, State School for White Girls, State School for the Deaf and Blind at Lineville, Alabama Home for Refuge, Reform School for Juvenile Negro Law Breakers, and the School for the Negro Deaf and Blind. There is no general board supervising these institutions.

POLITICS AND GOVERNMENT. The Legislature met in 1915, and its most important enactments relating to regulation of the liquor traffic are noted below. There was no election of the State officers.

The State became a prohibition State on July 1, 1915. On July 14th the Legislature passed prohibition bills which were vetoed by the Governor. He asked that the prohibition question should be submitted to voters at a special election. Both Houses of the Legislature on January 22nd voted down this proposal and repassed the bills by overwhelming majorities. These measures enacted the Prohibition Act repealed in 1911, after having been in force for two years. In that year a local option law passed the Legislature under which all but 8 of the 67 counties of the State voted dry. Both houses of the Legislature on February 2nd passed, over the Governor's veto, the anti-liquor advertising law designed to prohibit newspapers published in the State from printing liquor advertisements, and to prevent the circulation in the State of papers published outside of Alabama carrying such advertising. This measure also prohibited liquor advertising by circular, bill-board display, or otherwise. This law was upheld by the decision of the Supreme Court rendered on March 26th. The chancellor in his opinion said that the new law would not violate the Federal or State Constitutions or interfere with interstate traffic. It was declared by Judge Miller of the Court of Appeals, however, that newspapers published in other States and sent to Alabama by mail or freight become articles of interstate commerce, and as such could not be interfered with by State authority. A bill authorizing a vote at the next general election on a women's amendment to the State Constitution was defeated in the House of Delegates on August 25th. Fifty-two members voted for the measure and 42 against it; a two-thirds vote was necessary for the passage of the bill. The Senate defeated an equal suffrage measure by a vote of 21 to 10 on September 1st.

STATE GOVERNMENT. Governor, Charles Henderson; Lieutenant-Governor, Thomas E. Kilby; Secretary of State, John Purifoy; Auditor, M. C. Allgood; Attorney-General, W. L. Martin; Adjutant-General, G. J. Hubbard; Treasurer, W. L. Lancaster; Superintendent of Education, W. F. Feagin; Commissioner of Agriculture, J. A. Wade; Commissioner of Insurance, C. B. Smith;—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, John C. Anderson; Associate Justices, Thomas C. McClellan, J. J. Mayfield, A. D. Sayre, Ormond Sommerville, William H. Thomas, and L. D. Gardner; Clerk, Robert F. Ligon.

STATE LEGISLATURE.

	<i>Senate</i>	<i>House</i>	<i>Joint Ballot</i>

ALABAMA, UNIVERSITY OF. A State institution for higher education founded at University, Alabama, in 1831. The total enrollment in all departments in the autumn of 1915 was 1505. The faculty numbered 101. There were no notable changes in the membership of the faculty during the year, and no noteworthy benefactions were received. The university is supported almost entirely by legislative appropriations. The library contains about 45,000 volumes. The president is G. H. Denny, LL.D., D.C.L.

ALASKA. The year 1915 has been one of increasing prosperity and of great economic advances for this vast Territory. In minerals, gold and silver products have increased, the copper product quadrupled, and coal lands surveyed for lease and entry. Fisheries flourished, and aids to navigation were largely installed. The government railway has been put under construction. Education and supervision have improved the conditions of natives, who can now become citizens or organize self-governing towns. The Legislature has enacted laws which deal with modern life as broadly and fully as any of our States.

POPULATION AND TOWNS. The population is estimated at 70,000, of whom 44,000 are whites. The following show the assessed value and per cent of taxes in towns in 1914: Juneau, \$2,852,000, 2.5; Fairbanks, \$2,829,403, 1.5; Nome, \$1,683,564, 1.5; Ketchikan, \$1,040,175, 1.25; Seward, \$929,960, 0.8; Cordova, \$917,770, 0.6; Valdez, \$750,000, 1.5; Skagway, \$610,215, 1.0; Douglas, \$542,205, 1.0; Wrangell, \$200,227, 1.5; Petersburg, \$190,975, 1.5.

LAWS. The Legislature met March 1, 1915, and enacted timely laws of special importance. Among others were the following: Granting citizenship to natives free from tribal relations; according self-government to villages of 40 adult Thlinget, Tsimpscan, or Hyday natives; excluding minors from pool-rooms, etc.; punishing white slavery and seduction; inhibiting liquor sales to natives; extending the eight-hour law to placers, etc.; protecting wild game; providing for education, roads, and revenues; a workman's compensation law surpassing in liberality that of any other State. Referendums were authorized at the next general election as to a general eight-hour law, and for complete Prohibition on Jan. 1, 1918, of sale or manufacture of liquor.

MINERAL PRODUCTION. Data as to the most extraordinary productivity during 1915 in mineral outputs have been drawn from the preliminary report, dated Jan. 1, 1916, of Mr. Alfred H. Brooks, Chief of the Alaskan Division, United States Geological Survey. The figures, it is believed, will not vary over 5 per cent from the final revision. The value of the mineral products in 1915 far exceeds that of any previous year, aggregating \$32,000,000 and exceeding by 68 per cent the output of 1914, which amounted to \$19,064,963. The earlier maximum production of \$23,378,428 was in 1912, when the bonanza placers of Fairbanks and of Nome were at the height of their productivity. Practically 90 per cent of the increase of 1915

was due to the copper output which rose in value from \$2,852,934 in 1914 to \$14,400,000 in 1915. There was a small increase in gold production, from \$15,026,813 in 1914 to \$15,900,000 in 1915. It is the largest annual output of gold since the record maximum of \$17,145,951 in 1912. Silver values rose from \$218,327 in 1914 to \$400,000 in 1915. Tin, antimony, coal, petroleum, etc., increased from \$222,802 the previous year to \$300,000 in 1915. The vast increase in the total mineral output of 1915 is not due to a temporary expansion of the mineral industry, or to stimulation from urgent market demands. It is the natural outcome of pioneer work on mines not previously developed to the producing stage. The current production is precursory to similar increases in the future output of both copper and gold lode mining. Gold placers and coal seams await transportation for fuller development. To date the mineral production of Alaska aggregates in value \$300,000,000, divided as follows: Gold placers, \$186,200; gold lodes, \$74,850,000; copper, \$34,150,000; silver, about \$2,650,000; tin, petroleum, coal, etc., about \$2,150,000.

Gold Mining. The placer gold of 1915 is valued at \$10,500,000, a decrease of \$230,000 from 1914. It is believed that the current decrease in the Yukon camps will be fully offset in coming years by important developments in the Tolovana district, northwest of Fairbanks. The number of working dredges, 42, remains unchanged. While productive gold lode mines decreased from 28 to 23, yet the output rose from \$4,863,028 in 1914 to \$6,200,000 in 1915. The increase was in the Juneau district, where steadily enlarged outputs may be expected for many years. Conditions of placers by the principal districts are as follows: The products of the camps in the Yukon basin were \$7,795,421 in 1914; they decreased about \$500,000 in 1915. Fairbanks from 115 placers obtained \$2,450,000 in 1915 as also in 1914. Innoko with 38 mines, and Iditarod with 31 placers produced about the same in 1914 and 1915. The yield of Hot Springs from 30 placers was about \$550,000 in 1915. Koyukuk increased from \$260,000 in 1914 to \$300,000 in 1915. The Kenai and Susitna regions report about \$500,000, an increase of \$100,000. There were substantial gains in Seward Peninsula, \$2,900,000 in 1915, against \$2,700,000 in 1914.

Copper Mining. There was produced in 1915, from 14 mines, copper to the amount of 83,850,000 pounds, valued at \$14,400,000, as against 21,450,628 pounds and \$2,852,934 in 1914. In the Ketchikan district 7 mines produced 4,500,000 pounds. The four mines in the Prince William Sound region showed slight gains. In the Chitina district the Bonanza and Jumbo mines increased their output enormously, while large amounts came from Mother Lode, despite its location, which entails 14 miles of sledding to the railroad. While high prices caused the reopening of a few small copper mines, the main development was normal.

Miscellaneous. The output of tin has materially increased, mainly from the York district, Seward Peninsula, from which came the greater part of the 200 tons of stream tin in 1915. A new source of Alaskan mining has been developed from the stibnite ores of Seward Peninsula and of Fairbanks, from which in 1915 antimony was obtained to the value of \$70,000.

The coal conditions are yet unsatisfactory, as importations were necessary to the value of \$400,000. Relief is, however, in sight. Surveys of the more accessible parts of the coal areas have been made in the Bering River, Matanuska, and Nenana districts, and leases will soon be available. Permits for free mining on areas under 10 acres have been made, and in 1915 patents for three sections of coal lands were issued.

AGRICULTURE AND HOMESTEADS. The national experimental stations have materially improved and stimulated agriculture. The station at Sitka fosters horticulture; Rampart devotes its efforts to grain, breeding, and forage plants, with success; Fairbanks continues demonstration work to the advantage of the farmers of the Tanana Valley; Kodiak is developing stock-raising and dairy-farming, hampered by the law-protected and marauding brown bear. Skagway and Fairbanks by annual fairs display the wealth of Alaskan farm products. Only 50,000 acres of land have been patented during 1915. The expensive and obligatory survey at private expense, and restrictive regulations discourage homesteading, except in national forests. Despite these conditions hundreds of homesteads were located in 1915, both on surveyed and on unsurveyed lands. The Governor estimates that there are 50,000,000 acres of land suitable for agriculture: large areas are in the Matanuska and Susitna valleys, which will soon be accessible by the railway under construction.

COMMERCE. The total trade, including minerals, to and from Alaska during the fiscal year ending June 30, 1915, was valued at \$70,113,916, an increase of \$9,037,692. For the nine months ending Sept. 30, 1915, the increase was 12 per cent over the same period in 1914. In the fiscal year 1915 the shipments into Alaska aggregated \$20,792,609, of which 29 per cent were in foodstuffs. Despite a steadily increasing white population the shipment of liquors has decreased from \$722,000 in 1913, to \$555,000 in 1915. A notable decrease from 1914 to 1915 is that of 8 per cent in potatoes, due to the improved farming of the Territory. It is of interest to note that the exportation from Alaska of salmon in 1915, valued at \$18,375,000, exceeded by \$3,026,000 the entire shipments of domestic gold and silver.

FISHERIES. See article FISH AND FISHERIES.

FUR SEALS. The provisions of the North Pacific Pelagic Sealing Convention of July 7, 1911, remain in force and are quite efficiently maintained. Sealing on the Pribilof Islands is prohibited, by the act of Congress of Aug. 24, 1912, until the year 1917. In January, 1915, the commission of experts—Osgood, Parker, and Preble—made a full report as to conditions, remedies, etc., of the seal herds of the Pribilofs. In 1914 the herd consisted of approximately 294,700 animals, of which not less than 93,250 were females of breeding age. By August, 1915, they had increased to 360,000, of which not less than 103,000 were females. On these reports it is expected that Congress will be able to legislate on data fully reliable. Some 3500 seals were killed in 1915 as a food supply for the natives during the coming winter. Secretary of Commerce Redfield plans to develop a new American industry for the dressing, dyeing, etc., of the seals, and also to utilize the seal-bodies now wasted.

FUR-BEARING ANIMALS. An inter-departmental board has considered the anomalous and con-

fusing systems of control over the fur-bearing animals of Alaska—entrusted to several different departments. Under existing law, for instance, the black bear is under the Department of Commerce, while the brown bear is entrusted to the Department of Agriculture. The board recommended legislation by Congress to give the Department of Agriculture control over all terrestrial fur-bearing animals, and that the Department of Commerce should "exercise exclusive jurisdiction over fisheries, fur seals, sea otters, walrus, sea lions, whales, porpoises, and other aquatic mammals." See also *FUR*.

EDUCATION. There were maintained 47 public schools with 2503 pupils: of these 14 schools and 1542 pupils were in, and provided for by, incorporated towns. The Legislature has provided for educational facilities, and it enacted two laws for the complete coordination of the conflicting systems. As they are considered to be beyond the legislative powers these laws await the action of Congress. The schools of the United States Bureau of Education are mentioned under *Natives*.

FORESTS. The national forest reservations remain unchanged, except that a considerable area of the Chugach forest has been restored to the public domain. After paying all expenses from the receipts of \$47,366, there remained a net income of \$7164. Applications for permission to make homestead entries in these forests have largely increased, and there were in 1915 100 pending cases for Tongass and 188 for Chugach forest. See also *FORESTRY*.

REINDEER. From year to year reindeer become more important to the natives. Their value increases with the gradual transformation of the hunting natives—previously migratory from Point Barrow to the Alaskan peninsula—into settled stock-growing communities. The herds on June 30, 1914, aggregated 57,782 head, which through the average annual increase of 20 per cent should approximate 70,000 in number on June 30, 1915. Two-thirds of the deer are in the hands of natives, who in 1914, to the number of 980, owned 37,828 reindeer, valued at \$945,700, and furnishing an income—exclusive of domestic uses—of about \$78,000 annually. The herds near Bethel aggregate 8500 head, and at five other places number between two to four thousand deer. Small herds have been sent to the islands of Amakmak, Atka, Annette, and Umnak.

NATIVES. About 15 per cent of the natives are reported to be tuberculous, and various epidemics are reducing their number. The Alaskan Legislature of 1915 memorialized Congress to make suitable provisions for their medical relief. The natives of Southeastern Alaska are generally industrious and self-supporting. The Governor of Alaska reports that the reservation of the Aleutian Islands as a game preserve has injuriously affected the natives and by denying employment in fisheries, etc., has reduced them to "actual want, even starvation." The Eskimo, some 5000, of the Yukon and Kuskokwim deltas, are deteriorating from illicit liquor traffic, and lack the practical education and industrial training which would improve their material condition. Thousands of natives elsewhere are receiving practical instruction through the 67 schools of the United States Bureau of Education, in which about 3500 pupils are enrolled. By the teachers sanitary methods are enforced, indus-

tries promoted, and individual responsibility stimulated. Gardens, libraries, village councils, school republics, clubs, shop-work, and entertainments are methods used. Coöperative stores have been successfully conducted by natives at Atka, Hydaburg, Klawock, Klukwan, and St. Lawrence Island. Recent legislation renders possible citizenship for natives, and self-government for their communities. Reservations for such villages have been made on Kobuk River and at Tyonek, Cook Inlet. On Jan. 28, 1915, the Secretary of the Interior promulgated regulations for the self-government of the Metlakatla Indians, on Annette Island reservation, which will be the model for the control of other similar communities. The officers of the Public Health Service, with inadequate force and insufficient funds, have struggled with the medical care of thousands of sick natives. In addition to the small hospitals at Kotzebue, Nulato, and Nuahugak, there are doctors and nurses at Nome, Russian Mission, Seward, and Sitka. Contract service is had from several hospitals elsewhere. Complications have arisen regarding the Metlakatla Indians, and congressional action has been recommended by Secretary of the Interior Lane to definitely fix their status, so that they may acquire citizenship, own land in severalty, and have such advantages as other Indians in Alaska, as to education, self-government, etc.

ROADS AND RAILROADS. The railway mileage remains unchanged at 446 miles, of which there have been operated only the following: White Pass and Yukon, 21 miles; Yakutat and Southern, 9 miles; Tanana Valley, 46 miles; and the Copper River and Northwestern (Cordova to Kinneceutt), 195 miles. The Alaska Northern has been bought by the United States, and construction work begun (about 15 miles completed) on the government branch from Anchorage, Knik Arm, up the Matanuska Valley. The Board of Road Commissioners, United States army, had completed up to June 30, 1915, an aggregate of 3695 miles of roads, etc., divided as follows: 902 miles of wagon roads, 577 miles of winter sled-roads, and 2216 miles of trails. Land travel is now practicable at all seasons of the year from Valdez northwards to Kotzebue Sound, and the upper Koyuk Valley. The winter mail even reaches extreme Northern Alaska, Point Barrow, on the coast of the Arctic Ocean.

GEOLOGIC SURVEYS. In 1915 the United States Geological Survey covered about 20,000 square miles of Alaska, 9000 miles being geologic work and 11,000 square miles topographic.

COAL PERMITS. Under the provisions of the regulations of the United States Commissioner of Public Lands of Dec. 30, 1914, several local permits have been issued for the free mining of coal lands of 10 acres or less.

TELEGRAPHS. The military telegraph system, extending by cable to Sitka, Juneau, and Valdez, reaches nearly every town as far as Nome to the west and Circle City to the east. The rates were lowered 25 per cent in 1915, and night service instituted for domestic messages at reduced rates. The naval wireless system reaches Sitka, Cordova, and the Pribilofs.

AIDS TO NAVIGATION. Most successful efforts have been made during 1915 to increase safety of navigation in Alaskan waters. Up to November 30 there had been established, during the year, 46 aids (beacons, buoys, and lights). The more important are the 24 flashing acetylene

lights, located as follows: Lewis Reef, Tongass Narrows; Narrow and Middle Points, Clarence Strait; Point Alexander, Wrangell Strait; Mar-mion Island and Sheep Creek, Gastineau Channel; Clear Point, Barlow, Naked, and Little Islands, and Low Point, Lynn Canal; Kingsmill Point, Point Augusta, Hawk Inlet Entrance, and East Shoal, Chatham Strait; Otsoia Island, and McClellan Rock, Peril Strait; Anchor and Race Points, Flat Island, East Chugach, and East Forelands, Cook Inlet; and Point Romanoff, Norton Sound. Good progress was also made in the construction of the new light and fog-signal at Cape St. Elias, Kayak Island, for which \$115,000 was appropriated by Congress Oct. 22, 1913.

CONGRESSIONAL LEGISLATION. During the year 1915 legislation has been principally confined to the making of appropriations. Since the national administration adopted the policy of developing Alaskan resources, the necessity has been recognized of reforming and modifying existing governmental methods so as to ensure efficiency. Secretary of the Interior Lane has analyzed current administrative regulations, and the summary thereof discloses amazing conditions of delay, extravagance, and inefficiency. To acquire a homestead, for instance, requires the expenditure by the applicant of hundreds of dollars for surveys, etc., while periods ranging from two to seven years elapse before the final patent issues. A fox farmer, under advice, sought to obtain a lease from three different departments in turn, only to be informed that no one had power in the case. Revenue taxes levied by the Alaskan Legislature clash with national powers. The school systems are conflicting and in an inchoate condition, as are other interests of the general public. Early congressional legislation is imperative. To remedy the more striking defects it has been suggested that the President be empowered to appoint, subject to confirmation by the Senate, a Development Board, which should be resident in Alaska and be charged with the control of the greater part of national affairs. Meantime Alaska asks that Statehood be granted to the Territory.

ALBANIA. Nominally an independent country; formerly a region of European Turkey, consisting of the vilayets of Scutari and Janina, and of parts of Kossovo and Monastir. Albanian independence was proclaimed at Valona Nov. 28, 1912, and on the 20th of the month following the London Ambassadorial Conference agreed to the principle of Albanian autonomy. Under the treaty of London of May 30, 1913, Albanian boundaries were left to the decision of the Powers. On Feb. 23, 1914, Prince William of Wied accepted the crown of Albania, offered to him by an Albanian deputation, ascended the throne March 13, and in the following September left the country. Thereupon Essad Pasha, who had been expelled from Albania in May, returned and made an unsuccessful attempt to set up a military government. Anarchy ensued.

The provisional frontiers of the country would have embraced an area of about 10,800 square miles, with a population of about 850,000. This area has been encroached upon, from the south, by the Greeks. Of the inhabitants, Mohammedans are estimated to number 590,000, Orthodox 140,000, and Roman Catholics 120,000. Estimated population of towns: Durazzo (the provisional capital), 5000; Scutari, 35,000; El-

basan, 13,000; Argyrocastron, 12,000; Tirana, 12,000; Berat, 8500; Korytza, 8000; Valona, 6500.

HISTORY. After the prudent but inglorious retirement of the Prince (Mpret) William of Wied (a German princeling who had been placed upon the throne by the Powers in 1913, see the YEAR BOOK for 1913 and 1914) from the turbulent Principality of Albania, the government fell into the hands of Essad Pasha, who had formerly held the portfolios of war and the interior in William's cabinet, and had subsequently been exiled as a traitor to his sovereign. Returning in triumph after the flight of the Prince, Essad seized the government and declared that he would hold Albania in trust for Burhan Ed-din, a younger son of ex-Sultan Abdul Hamid. Essad, however, found it extremely difficult to retain the loyalty of his Mohammedan supporters, since his own sympathies were with Italy and Serbia, whereas the Mohammedans of Albania in large part espoused the cause of the Central Powers at whose side Turkey was fighting. Unrest caused by the scarcity of food supplies and local disturbances, which the government was powerless to prevent, had before the close of the year 1914 furnished Italy with an excuse for the occupation of Avlona and given Greece a pretext for the seizure of Albanian Epirus. All these circumstances contributed to swell the current of discontent in Albanian politics and led directly to the outbreak of rebellion in January, 1915. Up to the very gates of Durazzo the rebel forces surged, demanding the retirement of Essad Pasha, the reversal of his pro-Serbian and pro-Italian policies, and the surrender of the Serbian and Italian envoys at Durazzo. Terrified, Essad Pasha appealed to Italy for aid in defending himself against the rebels. In response to his appeal, Italian warships, which had been detailed to watch the Albanian situation, directed their guns against the rebels and repulsed the attack on Durazzo. In view of the critical situation, Italy landed more troops on the Albanian coast, and Greece hurried a warship to protect the numerous Hellenic inhabitants of Durazzo. By recalling the warship, shortly afterwards, the Greek government recognized Italy's predominant interests in the northern part of Albania.

In February a large force of Albanian insurgents crossed the frontier into Serbia, near Prizrend, and occupied Zapod, Topliana, Glavotchnitch, Vrbnitza, Jour, and Vranichte. Sympathetic observers interpreted the incident as an indication of Albanian nationalism, which aspired to reunite with Albania the Albanian populations of Prizrend, Prishtina, Mitrovitza, Uskub, Dibra, Struga, and Ochrida, chafing under Serbian rule, in addition to Jakova and Ipek, recently annexed by Montenegro. The Serbian government, however, regarded the irregular Albanian invasion of Serbia as an act of wanton aggression which would fully justify a retaliatory Serbian invasion of Albania. The Albanian rebels, it was alleged, were being supplied with arms and incited to attack Serbia by agents of Austria. Serbia must therefore take measures to pacify her Albanian frontier. Accordingly Serbian troops crossed over into Albania from Ochrida, in Southwestern Serbia, and advanced in the direction of Elbassan. After defeating an Albanian force at Krakew, the Serbs entered Elbassan, June 3d, and pressed on to Tirana. There they were met by Essad Pasha,

who had held out against the rebels at Durazzo and had finally driven them off, although on more than one occasion his palace had been damaged and he had stood in imminent danger from the rebel artillery. The amicable relations between Essad Pasha and the invading Serbs was strikingly manifested when Essad joined the invaders and the Serbian commander issued a proclamation announcing his intention to punish the insurgents who had rebelled against Essad Pasha and promising to withdraw from Albania as soon as "Albania's son" (Essad Pasha) had been firmly reinstated. "We bring peace and love," declared the Serbian leader, "to all who are with us, and against those who are opposed to us we draw the sword."

While the Serbian army invested Durazzo and temporarily opened Serbia's long-coveted "window on the Adriatic," Montenegrin forces invaded Albania from the north and won back for King Nicholas the prize of which Austria had deprived him in 1913. In view of the fact that other Powers had occupied other parts of Albania, Montenegro felt warranted in reconquering the important town of Scutari in Northern Albania, June 27th. The Montenegrin commander, General Vukotich, lost no time in arresting the Austrian agents who, according to the Montenegrins, had generously supplied Albanian nationalists with arms, money, and grievances for attacks on Montenegro. Large quantities of ammunition of Austrian origin were reported to have been confiscated in Scutari by the Montenegrin authorities. While Serbian and Montenegrin forces were taking possession of parts of Albania, the Italian press manifested some concern lest Italian interests might be injured. In July, however, Montenegro promised to submit her Albanian claims to the decision of the Entente Powers, and in the following month Premier Pashitch of Serbia was quoted in an important interview by the *Corriere della Sera* to the effect that Serbia would fully recognize Italy's dominant interests in the Adriatic littoral.

In December, as a result of the Austro-German-Bulgar campaign in Serbia, some remnants of the Serbian armies, accompanied by throngs of homeless and terror-stricken Serbian peasants, sought refuge in Albania. The scarcity of food and the prevalence of disease in Albania were consequently still further aggravated. In December also the Italian government landed some thirty thousand troops in Albania. This step was heralded in the press as a loyal effort to succor Serbia; quite possibly, however, Italy's action was calculated solely to strengthen her hold upon the coveted coast of Albania. Just at the close of the year it was reported that a Bulgarian army, pursuing the Serbians into Albania, had captured the Albanian town of Elbasan. Consult article on the WAR OF THE NATIONS.

ALBEE, JOHN. American author and poet, died March 24, 1915. He was born at Bellingham, Mass., in 1833, and graduated from Phillips Academy, Andover, in 1854. He studied theology at the Harvard Divinity School in 1858. During his student days he was a frequent visitor at the home of Ralph Waldo Emerson at Concord. He was also an intimate friend of the Alcotts and Thoreau. For many years he lived at New Castle, N. H. He wrote much in prose and verse. Among his writings are: *Literary*

Art (1881); *Poems* (1883); *History of New Castle* (1884); *Prose Idylls* (1892); *Remembrances of Emerson* (1900); and *Confessions of Boyhood* (1910).

ALBERT, KING OF BELGIUM. See BELGIUM and FRANCE, *History, passim*.

ALBERTA. A province of the Dominion of Canada, between Saskatchewan and British Columbia. Capital, Edmonton. Area, 255,585 square miles. Population, according to the census of 1911, 374,663, the increase over 1901 being 413.1 per cent. In 1911, Edmonton had 24,900 inhabitants; Calgary, 43,704; Lethbridge, 8050. These towns have since greatly increased in population. The provincial government is under a lieutenant-governor, appointed by the Governor-General of the Dominion. He acts through an executive council, or responsible minority of eight members. There is a unicameral legislative assembly of 56 members elected by direct vote for five years. Lieutenant-Governor in 1915, Robert George Brett, succeeding George Hedley Vicars Bulyea. Premier in 1915, A. L. Sifton. See CANADA.

ALCOHOL. The European war has been the occasion of a great deal of discussion as to the effects of alcohol in relation to the soldiers. Early in the war, as noted in the 1914 YEAR BOOK, all of the contending nations took more or less severe measures against the production and consumption of alcoholic beverages. The evidence is overwhelming that the use of alcohol, even in small amounts, impairs muscular co-ordination, dulls the mind and special senses, and reduces efficiency in work demanding rapid and accurate mental or physical effort. The military authorities in Europe, however, evidently think that the soldier in the field needs some stimulation in times of unusual stress, strain, and exposure, and that it compensates in its stimulating effects enough to counterbalance its admitted disadvantages. The *British Medical Journal*, in discussing the question, gives the amount of alcohol allowed by the army regulations of various countries. The English army ration allows each man two and a half ounces of rum twice a week, while in the trenches the men are allowed three ounces twice a week in ordinary weather, and two and a half ounces daily in bad weather. This is a minimum of five ounces a week and a maximum of seventeen and a half ounces. Two and a half ounces of rum is estimated to contain 25.5 grammes of alcohol. In the French army each soldier is allowed daily 50 grammes of rum, an equivalent of 20 grammes of alcohol. The German soldier has a daily allowance of 1793 grammes of beer and 20 grammes of brandy, equivalent to 70.7 grammes of alcohol. The Austrian soldier receives daily one-half litre of wine, equivalent to about 40 grammes of alcohol.

One of the unfortunate effects of the suppression of the manufacture of vodka in Russia, according to the *Policlinico* of Rome, is that lotions and medicines containing alcohol and denatured alcohol are being consumed in large amounts since the supply of liquor has been cut off. As a consequence a number of deaths have occurred from poisoning and it was deemed necessary to issue a decree that no remedies containing alcohol may be sold without a physician's order. This decree met with such a storm of protests that it was rescinded and a new order issued to the effect that not more than 30

grammes of any medicinal preparation containing alcohol could be sold to one person. Kuznetsoff states that after the prohibition of the sale of vodka in Russia last August, cases of poisoning from denatured alcohol, varnish, and other substitutes for the Russian whiskey began to crowd the hospitals. At Petrograd the number admitted to one large hospital had reached 1292 by the end of the year, including 861 cases of poisoning from denatured alcohol, 382 from varnish, and 48 from both combined. There were 11 deaths. The cases are classified by trade or profession, and Lukin discusses the pathologic and anatomic findings.

Under a decree of June 30th, Austria has prohibited the establishment and operation of new non-agricultural distilleries of alcohol, which are subject to a consumption tax under the laws of 1888 and 1889. The construction and operation of new alcohol refineries is likewise prohibited, and no enlargements may be made which would result in increased production.

Lambert, in considering the reasons for the relapses of periodic drinkers, is inclined to believe that these cases are really victims of nicotine poisoning and this is seen most frequently among cigarette smokers, who inhale the smoke. He explains the sequence of events somewhat as follows: tobacco at first is used to soothe the nerves, and for stimulating the circulation and quickening the cerebral action. It apparently increases mental activity in the early stages of moderate indulgence, and it becomes at length a panacea for the small worries and disturbances of daily life. Soon we have the usual evidence of habit formation, the individual being contented and soothed during the period of indulgence, but nervous and unstrung at other times. Finally the narcotic effect is lost and the patient turns to alcohol as a substitute, and such an occasion usually ends in a spree. With returning sobriety both the alcoholic and tobacco poisons are eliminated, but the victim soon begins smoking again as the less harmful habit. Lambert is convinced that the majority of periodic drinkers are subjected to double narcotic poisoning and if they are made to stop smoking the alcoholic craving ceases automatically. See *INSANITY; OCCUPATIONAL DISEASES*.

ALDRICH, NELSON WILMARTH, former United States Senator, from Rhode Island, died April 16, 1915. He was born in Foster, R. I., in 1841. His career began as a clerk in a wholesale grocery store in Providence. He was successful from the very beginning of his commercial life. His business career was interrupted in 1862, when he enlisted as a private in the tenth Rhode Island infantry. After the expiration of his term of nine months, he returned to Providence, and became a partner in the wholesale grocery firm in which he had formerly worked. He was made a member of the City Council of Providence, and at once showed remarkable adroitness in politics. In 1875 he was elected to the Rhode Island House of Representatives, and in the following year became speaker. By that time he was a power in the politics of his State. Elected representative to Congress from the first district of Rhode Island in 1878, he served two terms, resigning in 1881 to take the position in the Senate left vacant by the death of Gen. A. E. Burnside. He was successively reelected to the Senate in 1886, 1892, 1898, and 1905, thus serving as senator from Oct. 5,

1881, until Mar. 3, 1911. It was not until he had been a member of the body for at least ten years that his power began to be felt. In 1883, when a measure for the revision of the tariff act came before Congress, Senator Aldrich gave first expression to what might be termed a New England idea in regard to tariff revision. Later it became known as the "Aldrich Idea." This idea was that the tariff should be made as high as possible. In 1890, when the McKinley bill was before Congress, Senator Aldrich was chairman of the committee. When it was reported out of this committee even its author could hardly recognize it, for in almost all important items the tariff had been made higher. In spite of this the bill was passed, and was signed by the President. Aldrich bitterly opposed the Wilson tariff bill, in 1896 and 1897. By this time it had become recognized that he was one of the most important figures in the Senate. It was said of Aldrich that he paid no attention to what was printed about him, that he denied nothing, and admitted nothing. After his entrance into public life, chiefly through investments in Rhode Island traction companies, he became a rich man. During the passage of the Payne-Aldrich tariff law charges were made that items in which the chairman of the Finance Committee was interested received more consideration than others affected by the bill. For once Aldrich was aroused, and made a categorical denial. In the Senate he, with Joseph G. Cannon of Illinois in the House, formed the bulwark of high tariff, which long stood against every attack of the reform element. Senator Aldrich was greatly interested in financial measures, and had a large part in the preparation of the Aldrich-Vreeland Currency Law. His power as a party leader was so great that he was known as the "Republican Boss of the United States." This power continued until a wave of insurgency overwhelmed the conservative group in Congress, and it was the clash between the ideas of party managers, and principally between the ideas of those led by Aldrich and Cannon and those advanced by the insurgents, that caused the split out of which grew the Progressive Party. Senator Aldrich declined renomination on the expiration of his term in 1911. He declared that he wished to devote his time to the work of the National Monetary Commission, of which he had been made chairman upon its organization in 1908. As chairman he directed a comprehensive investigation of American and foreign banking and currency systems, with the view of reforming the banking system of the United States. In 1911 he made public a tentative scheme designed to increase the effectiveness of bank reserves through their control by reserve associations. The scheme was endorsed by most monetary specialists, but owing to the fact that he was widely regarded as the agent of highly protected interests, it was not received with much popular approval. After his retirement from the Senate he spent most of his time in his country home at Warwick Neck on Narragansett Bay.

ALEXANDER, GEORGE, American Methodist Episcopal clergyman and editor, died Sept. 7, 1915. He was born in Scottsville, Ky., in 1852, and graduated from the University of Louisville in 1871. From 1871-73 he was tutor in the University of Louisville, and from 1873-75 professor of Latin and Greek at Warren College, Ky. After studying at Drew Theological Seminary,

and after pastorates at Lake Mohonk, N. Y., and elsewhere, in 1877 he joined the Louisville Conference of the Methodist Episcopal Church South, and was a pastor in Kentucky from 1877 to 1884. Returning from a year spent in Europe, he became professor of New Testament Greek and Exegesis in Vanderbilt University, holding this position until 1902, when he became presiding elder in Louisville. From 1906 until his death he was editor of the *Methodist Review*, and book editor of the Methodist Episcopal Church South. He was a delegate to many conventions, and took part in the most important movements of his church. He received honorary degrees from Emory and Henry College. His published writings include: *A History of the Methodist Episcopal Church South* (1894); *The Beginning of Methodism in the South* (1897); *The Son of Man—Studies in His Life and Teachings* (1899); and *New Study of the Resurrection of Jesus* (1913).

ALEXANDER, JAMES WADDELL, former life insurance official, died Sept. 21, 1915. He was born in Princeton, N. J., in 1839. When he was still a boy his family removed to New York City, where his father became pastor of the Fifth Avenue Presbyterian Church. The young man met Henry B. Hyde, the founder of the Equitable Life Insurance Society, and the friendship which followed resulted in the close business relations which existed between the two men up to the time of the death of Hyde in 1899. Mr. Alexander graduated from Princeton in 1860, and afterwards studied law. In 1859 Mr. Hyde took the first steps toward the founding of the Equitable Life, and in 1866 Mr. Alexander became secretary of the society. He was elected president in 1899. Soon after the death of Mr. Hyde he was made one of the trustees of his 501 shares of Equitable stock. Shortly after the death of his father, James Hazen Hyde became first vice-president of the society. A controversy between him and Mr. Alexander began and continued for five years, when it was ended by the investigation of the insurance companies carried on by Charles E. Hughes. In February, 1905, Mr. Alexander issued a petition calling for Mr. Hyde's withdrawal as candidate for reelection for the vice-presidency of the company and calling also for a mutualization of the company. A compromise was reached and Mr. Hyde and Mr. Alexander were reelected. The mutualization plan, however, met with delay. Mr. Alexander then began a publicity campaign against Mr. Hyde, and the latter retorted with charges against Mr. Alexander. The State Superintendent of Insurance was at last forced to investigate the society, and the board of directors also began an investigation, which resulted in the condemnation of both Hyde and Alexander. Nearly all the directors resigned, and the business of the society was almost at a standstill when Thomas F. Ryan bought Mr. Hyde's majority stock for \$2,500,000, and both Hyde and Alexander resigned. Nearly all Alexander's very large fortune was used up in settling claims arising from insurance affairs. After his business difficulties, he lived quietly at his summer home until his death. He received the degree of LL.D. from Princeton University, of which he was a trustee.

ALEXANDER, JOHN WHITE. American artist, died May 31, 1915. He was born in Allegheny City, Pa., in 1856. At the age of six-

teen he removed to New York City, where for three years he worked in the art department of Harper & Brothers as an illustrator. He went abroad in 1877 and studied at the Munich Royal Academy, and later in Venice, Florence, Holland, and Paris. On his return to the United States (1881) he at once won recognition as a portrait painter, and many eminent men sat for him, among them Walt Whitman, Joseph Jefferson, Oliver Wendell Holmes, John Burroughs, Grover Cleveland, Robert Louis Stevenson, and E. L. Lewis. In 1891 he became ill and went abroad for his health; visited Spain and Morocco; and in the course of his travels made a series of the portraits of distinguished writers. He exhibited in Paris for the first time in 1893, and this was the beginning of his international fame. Three portraits of women which he sent to the Salon were accepted. Because of the merits of these portraits he was elected an associate of the Société National des Beaux-Arts. The following December he exhibited two pictures at the Grafton Gallery in London, and there won new honors. Mr. Alexander also did distinguished work in mural painting. The six panels in the Congressional Library in Washington are representative of this phase of his art. He was one of the most active members of the National Academy of Design and was, from 1909 until his resignation shortly before his death, president of that institution. In 1909 he received the degree of LL.D. from Princeton University, and he also received medals and other marks of distinction at exhibitions at home and abroad. His pictures hang in some of the most important galleries of Europe and the United States. A public-spirited citizen, he was a trustee of many institutions in New York. He was, also, a member of the National Institute of Arts and Letters.

ALFALFA. Climatic conditions in 1915 were generally favorable to the growth of alfalfa in all the important alfalfa producing countries of the world, but the harvest of the hay was interfered with to some extent, especially in the United States, by periods of rainy weather. The world's acreage devoted to the crop, as indicated by reports, was increased mainly in North and South America, and principally in the United States and Argentina, the two countries in which alfalfa culture is assuming highly important proportions. Statistics on the world's production or on the yields by countries and states are not generally available. In the United States reports showed that Kansas, Nebraska, California, and Colorado continued to be the leading alfalfa producing States. In Kansas the acreage increased from less than 35,000 acres in 1891 to approximately 1,200,000 acres in 1915. Nebraska also reported an area of over 1,000,000 acres devoted to the crop the past year. The production in each of these two States was estimated at about 2,500,000 tons of hay. Among the Eastern States New York again held first place in alfalfa hay production. It was estimated that over 7,000,000 acres of alfalfa are now grown in the United States, and that the hay yield is approximately 18,500,000 tons annually. The alfalfa seed crop of 1915 was produced principally in Utah, Kansas, Nebraska, California, Arizona, Oklahoma, Idaho, and Montana. The annual yield of seed in the United States is reported as ranging at present from 350,000 to 375,000 bushels. The choicest

seed, or seed given preference by many buyers, is produced in Montana and other parts of the northern Great Plains regions.

Experience during the past year gave further proof that alfalfa is not successful under arid or semi-arid conditions when grown in the ordinary way, but that it requires seeding in rows and cultivation during the greater part of the growing period. From some localities in the Southern States alfalfa grown in a mixture with orchard grass was reported as giving a high tonnage per acre, preventing lodging of the alfalfa and furnishing in the hay a better balanced ration than either grown alone. For this purpose 15 pounds of alfalfa seed and 28 pounds of orchard grass seed were sown per acre. Work conducted at the California Agricultural Experiment Station showed that silage may be made from weedy alfalfa not well suited for hay, and that such silage can be used profitably as a supplementary feed for fattening steers on alfalfa hay and barley. In feeding trials by the Nebraska Agricultural Experiment Station, a ration of corn and alfalfa hay produced the cheapest gains of any ration used, and the steers fed corn and alfalfa hay gained as rapidly as the steers on any of the other rations in the comparison.

ALGERIA. A north African country, called a colony but regarded administratively as an integral part of the French Republic. Algiers is the capital.

AREA AND POPULATION. Area by departments, European and native population (1911 census), and total density per square kilometer, are shown below:

Department	Sq. Kms.	Europeans	Natives	D.
Algiers	54,540	271,767	1,421,819	31
Constantine	87,302	155,654	1,945,443	24
Oran	65,897	319,089	892,212	19
Algeria proper	207,789	746,510	4,259,474	24
Southern Territories.....	367,550	5,533	481,052	1
Total	575,289*	752,043	4,740,526	10

*222,119 square miles.

In addition to the foregoing, the population apportioned apart numbered 27,295 in Algiers, 17,349 in Constantine, 18,894 in Oran, and 7721 in the Southern Territories; making a total for all Algeria of 5,563,828 inhabitants. The principal towns are: Algiers, with (1911) 172,397 inhabitants; Oran, 123,086; Constantine, 65,173; Bone, 42,039; Tlemcen, 39,874; Blidah, 35,461; Tizi-Ouzou, 31,404; Sidi-bel-Abbès, 30,942; Philippeville, 27,370.

The births for the year 1910 numbered 153,157, still births 2338, deaths 108,950, marriages 40,776. For the year 1912: 161,851 living births (22,557 of which European), 2352 still births, 41,917 marriages, 10,730 divorces, 92,752 deaths.

PRODUCTION. The country is largely agricultural. In the table below are given, by departments and with totals for Algeria proper, areas in thousands of hectares and yield in thousands of metric quintals (wine in thousands of hectolitres) of main crops for the year 1912:

Crops	Al.	Con.	O.	Total
Vines, ha.	68.6	84.4	13.1	166.1

* Other foodstuffs, including roots and legumes.

† Sown grasses.

The area under vines in 1910 was 152,100 hectares, yielding 8,414,000 hectolitres of wine; cereals, 3,001,000 hectares, yielding 22,147,000 metric quintals; roots, legumes, etc., 89,300 hectares, 1,319,000 quintals; forage plants and sown grass, 26,000 hectares, 822,000 quintals. Natural grasses covered 851,000 hectares, the harvest being estimated at 3,871,000 quintals. Olive trees number 6,855,000, yielding 3,364,000 quintals of olives and 351,000 hectolitres of oil. In the table below will be found the areas devoted to principal cereal crops for two years, with the total yield and the average yield per hectare (preliminary figures) for 1914-15:

	Hectares		Quintals	Qs.
	1913-14	1914-15	1914-15	ha.
Wheat	1,368,034	1,298,633	9,481,472	7.3
Barley	1,267,932	1,094,005	8,679,835	7.9
Oats	231,714	238,770	2,189,172	9.2

Fruits, olive oil, timber, cork, and live stock are also produced for export. Silk culture is practiced. The mines yield iron, zinc, lead, silver, copper, mercury, coal, and petroleum. The phosphate industry is progressing. The fisheries products are of appreciable value. Live stock (1911): 226,764 horses, 192,484 mules, 279,315 donkeys, 1,113,952 cattle, 8,528,610 sheep, 3,861,847 goats, 110,012 swine.

COMMERCE AND COMMUNICATIONS. The table below shows the imports for consumption and exports of domestic produce in thousands of francs:

	1908	1909	1910	1912	1913
Imports ..	449,300	462,000	512,000	669,638	729,112
Exports ..	319,200	359,200	513,300	546,099	562,917

In the table below is given the 1912 trade by great classes, values in francs:

	Imports	Exports
Animals, etc.	37,888,000	64,804,000
Vegetable products	114,904,000	409,416,000
Minerals, etc.	45,452	47,058
Manufactures	471,394	24,821
Total	669,638,000	546,099,000

Vessels entered (1912 trade), 5375, of 6,589,265 tons. Railway in operation Dec. 31, 1912, 3285 kilometers of main and 150 kilometers of local lines; telegraph lines, 15,199 kilometers, wires, 39,652.

FINANCE, ETC. The budget for 1914 estimated the revenue at 171,364,550 francs and the expenditure at 171,325,658: for the Southern Territories revenue and expenditure were calculated at 5,531,025 and 5,508,458 francs, respectively. The debt stood Jan. 1, 1913, at 71,853,205 francs. A governor-general administers the country.

ALIEN LABOR LAWS. See under LABOR.

ALLEN, CHARLES JULIUS. American soldier, died June 15, 1915. He was born in Buffalo, N. Y., in 1840, and graduated from the United States Military Academy in 1864. In the same year he was appointed first lieutenant in the engineers. He was brevetted captain in August,

1864, for highly meritorious service in the forts at Mobile, Ala., and received the brevet of major for gallant services in the following year. During the war he served in the division of West Mississippi and the Department of Louisiana. He rose to be lieutenant-colonel in 1897, and brigadier-general in 1904, retiring, by his own wish, in the last named year. His chief work was in the construction of fortifications and in the improvement of rivers and harbors. During the Spanish-American War he was in charge of the defenses in Washington.

ALLEN, WILLIAM FREDERICK. An American editor and engineer, died Nov. 9, 1915. He was born in Bordentown, N. J., in 1836. Civil engineering he learned from practice in the field, and from private study. His early engineering work was followed by a long career as manager of the National Railway Publication Company, beginning in 1873. To him was referred in 1881 the problem of working out a standard time reckoning that would obviate the confusion due to the use of the more than fifty time standards then prevailing in the United States. His plan, which was adopted, is the one now used throughout the North American continent. He was for several years a delegate to the meetings of the International Railway Congress, and in 1905 was associate secretary-general of this body. He received an honorary degree from Princeton University, and from the Belgian government he received a decoration. He contributed to various magazines and encyclopædias on subjects relating to railways and standard time.

ALUMINUM AND BAUXITE. The production of bauxite and the consumption of aluminum in the United States, in 1914, was the largest ever recorded. There was an output of 219,318 long tons of bauxite, valued at \$1,069,104, compared with 202,241 long tons, valued at \$997,598 in 1913. The States which produced bauxite in 1914 were: Alabama, Arkansas, Georgia, and Tennessee. Arkansas produced about 80 per cent of the output. The production in Georgia, which held second place for two years, and in Alabama and Tennessee was considerably less in 1914 than in 1913. The imports of bauxite amounted to 22,484 tons, valued at \$96,500. Bauxite is used in the production of metallic aluminum, and the manufacture of aluminum salts, bauxite bricks, and alundon. Its use in the production of metal aluminum is by far the most important one. The quantity of aluminum consumed in the United States in 1914 was 79,129,000 pounds, compared with 72,379,000 pounds in 1913. The growth of the industry is shown by the fact that the production in 1844 was 150 pounds, in 1894, 550 pounds, and in 1904, 8,600,000 pounds. The value of the exports of aluminum and of the manufactures of aluminum amounted to \$1,546,510 in 1914, compared with \$996,964 in 1913. Aluminum is the most abundant of materials, and ranks third among the elements on the crust of the earth, being exceeded only by oxygen and silicon. See also **CHEMISTRY, INDUSTRIAL**.

ALVERSTONE, SIR RICHARD EVERARD WEBSTER, first baron. An English jurist, died Dec. 15, 1915. He was born in 1842, and was educated at Charter House School, and Trinity College, Cambridge. At Cambridge he was an honor man, and received the honorary degrees of LL.D. and D.C.L. In 1868 he became a barrister, and ten years later queen's counsel. He stood successfully for Parliament in 1885; was knighted in the same year; and was appointed attorney-general, an office which he held three times under Lord Salisbury. In 1899 he was made a baronet. Lord Alverstone was chiefly known in the United States as the English representative in the Alaska Boundary Commission. His vote in upholding the principal claims of the United States government before the commission resulted in the United States receiving a favorable decision. As a result of his action in this matter, he was severely criticised in Canada, the Canadians contending that the United States government went into the conference with foreknowledge that the United States claims were to be upheld and that Lord Alverstone had been made a commissioner largely to carry through the pre-arranged programme. This contention was never proved. Lord Alverstone also served as one of the English counsel to the Boundary Arbitration Commission, which met in Paris in response to the message of Cleveland on the Venezuela boundary dispute. In 1893 he was chairman of the British Commission at the World's Fair. He was made Lord Chief Justice of England in 1900, and at the same time was elevated to the peerage.

AMHERST COLLEGE. An institution for higher learning, founded in 1821 at Amherst, Mass. The enrollment in the several departments in the autumn of 1915 was 425. The faculty numbered 44. Prof. Walton Hale Hamilton, formerly of the University of Chicago, was appointed professor of economics, and Stark Young, formerly of the University of Texas, was appointed professor of English literature. The gifts received during the year amounted to about \$25,000. The productive funds at the end of the year 1915 amounted to \$2,796,000, and the income to \$176,364. The library contains 110,000 volumes. President, Alexander Meiklejohn.

ANÆSTHESIA. Bevan made a study of the methods of anæsthesia now in vogue and attempted to analyze them from the standpoints of safety, comfort, efficiency, control, simplicity, and the after effects and complications. The agents or methods studied are chloroform, ether, nitrous oxide gas, scopolamine and morphine, spinal anæsthesia, nerve blocking, infiltration, intravenous anæsthesia, both general and local, intrarectal, intratracheal, intrapharyngeal, Crile's anoci-association, together with mixtures and sequences. Most of his conclusions are those generally accepted at the present time. Ether given by the drop method is considered the most safe and simple form of inducing unconsciousness. The mortality is given as one in

5000 to 10,000 cases. There is a growing distrust of scopolamine and morphine (see TWILIGHT SLEEP). It is unreliable and unsafe. After the dose is once injected it is beyond the control of the surgeon. Delirium, sometimes of a serious character, is produced. As a preliminary to general anæsthesia the evidence is that scopolamine and morphine, even in small dosage, add to the anæsthetic risk and to the after complications. Bevan's study demonstrates it to be more dangerous than chloroform, and he estimates the risk as one death to 500 cases. It is uncomfortable and inefficient in a considerable number of cases. Nerve blocking, i.e. the infiltration with an anæsthetic such as cocaine or novocaine of the nerve supply to the part to be operated upon, requires a high degree of skill, occasions the patient considerable suffering, is not always efficient, and has often to be supplemented by general anæsthesia. In the hands of a specially skilled operator the method has, however, many advantages. Bevan's paper is notable for its open condemnation of rectal anæsthesia and Crile's anoci-association. Against rectal anæsthesia the same objections are urged as against the previously cited methods, namely, lack of safety, lack of control, discomfort to the patient, inefficiency, the possible complications of distention of the bowels, severe local irritation of the colon, with sometimes bloody diarrhoea, which may be fatal. Crile's assertion that in anoci-association the brain is completely severed from the field of operation by blocking the nerve with novocaine finds no acceptance; and the complicated sequence of scopolamine and morphine, nitrous oxide, oxygen, ether, novocaine and quinine, and urea hydrochlorid is also open to many objections. Rectal anæsthesia and anoci-association are described in the 1914 YEAR BOOK.

SACRAL ANÆSTHESIA. This is a term applied to the injection of a local anæsthetic into the sacral canal, called by Cathelin "epidural," and Lâwen "extradural" anæsthesia. The procedure consists of injecting through the dorsal hiatus 20 c.c. of a 2 per cent solution of novocaine, to which a small amount of epinephrin has been added. Bull has used this technic in 64 cases, the result being ideal in 47 of them, and failure in the rest. Of the complications incident to the method there were slight bleeding from the sacral canal in two cases, six cases had transient pallor, vertigo, and rapid pulse. These symptoms, however, were evanescent. The parts anæsthetized are those which lie below the level of the exit of the sacral nerve.

Blocking the pudic nerves by injecting them with novocaine in order to secure painless childbirth will be described under TWILIGHT SLEEP (q.v.).

Smith and Porter explain the dangers of spinal anæsthesia on the ground of exsanguination of the important nerve centres of respiration and circulation. A drug may affect the respiratory centre directly, or indirectly, by lowering the blood pressure to a point where this fluid is insufficient to supply the nutritive needs and the amount of oxygen necessary to carry on life. An alarming fall of the blood pressure is the first serious symptom noted in fatal cases of spinal anæsthesia, and Smith and Porter remark that the dilatation of the arteries controlled by the splanchnic vasomotor fibres may permit the corresponding veins to become dis-

tended so that not enough blood is left in the bulb and cord to supply these needs. They say, for instance, that a rabbit "may be bled to death into its own portal system, by section of the splanchnic nerves." When death does not ensue, permanent injury to important vital centres may be caused.

ANDERSON, GEORGE SMITH. American soldier, died March 8, 1915. He was born in Bernardaville, N. J., in 1849, and graduated from the United States Military Academy in 1861. In the same year he was appointed second lieutenant to the sixth cavalry, and served in frontier duty at Fort Hays, Kan. After taking part in many campaigns against hostile Indians, he was appointed assistant to the professor of natural and experimental philosophy at West Point, in 1877. In 1881 he was sent back to Arizona, and after remaining there a year was transferred to Colorado. In 1885 he was appointed captain of the sixth cavalry. In 1899 he was major in the second cavalry, but was transferred back to the sixth. In the same year he went to the Philippines as colonel of the United States volunteer infantry, and he with this regiment took a prominent part in quelling the Philippine insurrection. Appointed colonel of the eighth cavalry in 1903, he later became colonel of the ninth cavalry. In 1911 he was made brigadier-general, and was given command of the Department of Visaya in the Philippines. The following year he was retired.

ANGLO-FRENCH LOAN. See FINANCIAL REVIEW, section so entitled.

ANGOLA. A West African Portuguese colony, with an estimated area of about 490,000 square miles, and a population estimated at 4,200,000. St. Paul de Loanda is the capital. Tropical agricultural products are exported. The rubber supply is failing. The trade is mainly with Portugal. In 1909 the imports were valued at 5,674,861, and the exports at 5,485,085 milreis; transit, 326,349 milreis. In 1910 the imports were valued at 6,022,294 milreis, and the exports at 3,311,863; transit, 326,349. The trade for 1912 is unofficially reported, exclusive of Congo, at £1,068,200 imports, and £1,394,200 exports. Revenue (estimate) in 1909-10, 2,321,373 milreis; expenditure, 3,171,373; 1913-14, the budget balanced at 5,092,677 milreis. Work on the railway line from Lobito Bay, in the southwest frontier of the Belgian Congo, which is to connect with the Central African system, is progressing. Total length of lines open for traffic in 1913, 323 miles. The colony is administered by a governor-general.

ANNAM. A French protectorate on the China Sea; a part of the dependency of French Indo-China (q.v.). Hué is the capital, with 65,000 inhabitants, and Bin-Dinh the largest town (75,000). The trade is included with that of French Indo-China. Raw silk, cattle, and agricultural and forest products are exported. There are valuable mineral deposits, but mining is not well developed. The native king (Duy-Tan) is the nominal head of the government. He succeeded, in 1907, at the age of eight, and was placed under a council of regency. Internal affairs are actually administered by the French resident.

ANTHROPOLOGY. While the European war has interfered with the commencement of novel researches on the previous scale and prevented the continuation of old ones, anthropology is still reaping a considerable harvest of publications based on investigations dating farther back. In America, indeed, anthropological activity seems unabated either in point of publication or research.

ANTIQUITY OF MAN AND PHYSICAL ANTHROPOLOGY. While no epoch-making discovery can be registered for this year, there has been a pronounced tendency to synthesize the entire problem of man's origin and development. Arthur Keith's *The Antiquity of Man* is primarily an anatomical treatise; the second edition of W. J. Sollas's *Ancient Hunters and Their Modern Representatives* is a more popular attempt, brought up to date, to sketch human evolution and to reconstruct ancient European culture by comparison with modern primitive peoples; somewhat similar in scope is G. Scott Elliot's *Prehistoric Man and His Story*; H. F. Osborn's *Men of the Old Stone Age* is distinguished by the welding together of anthropological, geological, and palæontological evidence for the purpose of presenting a definite chronology of human development.

A startlingly new interpretation of "The Jaw of the Piltown Man" has been given by Gerrit S. Miller (*Smithsonian Miscellaneous Collections*, vol. lxx, no. 12). According to him, the remains concerned include parts of a brain-case clearly human, but a mandible, two lower molars, and an upper canine showing features hitherto unknown except among members of the genus *Pan* (chimpanzee). Since the two groups of finds possess the exact characters of genera belonging to distinct families, the best assumption is not that they belonged to a single unknown genus, but to two distinct individuals, the skull belonging to a man, the jaw to a chimpanzee. While it has been supposed that chimpanzees were lacking in the Pleistocene European faunas, some corroboration for Miller's theory is found in the fact that a tooth not clearly distinguishable from the first lower molar of a chimpanzee has been discovered in the German Pleistocene.

In a discussion of the Baining of New Britain, L. Bauer (*Archiv für Anthropologie*, p. 145 et seq.) arrives at the conclusion that a host of primitive features are united in their short, high crania, which suggest Mongoloid and Australian affinities. The very small cranial capacity is explained by retrogression since all the surrounding types from which the Baining might have developed have a distinctly larger capacity. Political events have stimulated somatological researches among European populations. Thus Drontschilow (*ibid.*, pp. 1-76) publishes the results of an important investigation of the Bulgarians. He finds that besides the undoubted Slavic factor there is also a numerically very important Finnish element, dark-haired and long-headed, which is racially allied to the primitive Russian population. He further shows (*ibid.*, p. 337 et seq.) that the stature of the Bulgarians increases as one proceeds southward. The same nation is studied by Loritz (*Korrespondenzblatt*, p. 21 et seq.), who distinguishes

the North Bulgarian from the South Bulgarian long-heads. While the former must be traced to a northern zone of origin, the dolichocephalic southerners are due to South Macedonian relations and are probably connected with the people of Crete. "The Bronze Age Invaders of Britain" (*Journal Royal Anthropological Institute*, 1915, pp. 1-22) are discussed by A. Keith, who finds their cradle in the plains along the northern flanks of the central mountainous region of Europe. The racial affinities of the Jews are discussed by Schiff and Weissenberg (*Arch. f. Anthropol.*, pp. 348 et seq., 383 et seq.). Schiff corroborates the view of Von Luschan, that the Jews represent two distinct types, one allied to the peoples of Asia Minor, the other peculiarly Semitic, i.e. akin to the Bedouin Arabs. Weissenberg confirms Von Luschan's conclusion with respect to the fusion of these two distinct races, but differs as to the time and place of the process. Instead of being prehistoric and occurring in Palestine, the mixing took place in historic times and in Armenia.

GENERAL ETHNOLOGY

In general ethnology the extensive use of diffusion to account for similarities hitherto preferably explained by the psychic unity of mankind persists with unabated force. Thus in *The Migrations of Early Culture*, G. Elliot Smith infers from the examination of a mummy from Torres Straits that the natives must have borrowed the technique of mummification prevalent among the Egyptians of a definite period. He further suggests that at about 800 B.C. the processes of preserving corpses spread widely from northern Africa in association with many other cultural traits, such as megaliths, head-deformation, ear-piercing, the svastika, and a cult of sun and serpent. The transmission of such a cultural complex to remote areas is in thorough harmony with the views defended during the last decade by F. Graebner in Germany and more recently by W. H. R. Rivers in England. Rivers, indeed, comments sympathetically on Elliot Smith's theory, suggesting merely that instead of a single process of diffusion there may have been a number of successive waves of migration (*The Journal of Egyptian Archaeology*, 1915, p. 256 f.). An elaborate scheme of hypothetical layers of culture in Oceania has been developed by Rivers himself (see below), while Ankermann operates with corresponding conceptions in dealing with the problem of totemism (see AFRICA).

The relation of ethnology to other sciences has also occupied the attention of students. In his "Eighteen Professions" (*American Anthropologist*, 1915, p. 283 et seq.) Kroeber takes an uncompromising attitude against any attempt to connect ethnology, which he defines as a purely historical science, with either psychology or biology. A less decided position is maintained by Lowie in an essay on "Psychology and Sociology" (*American Journal of Sociology*, 1915, 217 et seq.); while he recognizes much of so-called psychological explanation of ethnologic phenomena as worthless, he believes that scientific psychology may lend greater vigor in the formulation of ethnological facts and act as a corrective in speculative interpretation, besides suggesting new vistas of inquiry.

The problems of social organization are in large measure dealt with in Rivers's *The His-*

tory of *Melanesian Society* (see OCEANIA). Lowie has pointed out that in North America "Exogamy and the Classificatory Systems of Relationship" (*American Anthropologist*, 1915, p. 223 et seq.) are co-extensive and genuinely correlated, as demanded by Rivers's theory. In his *Literary Aspects of North American Mythology* Radin calls attention to the oft-neglected fact that the tales collected from primitive tribes must be studied not merely from the point of view of their religious or philosophical interest or that of the distribution of certain plots and anecdotes, but also as literary products.

NORTH AMERICA. The tendency to reduce the number of linguistic stocks persists in spite of much skepticism on the part of some scholars as to the genetic affinities of certain families recently united by other linguists. Most noteworthy among the recent syntheses is Sapir's "The Nadene Languages" (*American Anthropologist*, 1915, 534 et seq.), in which an attempt is made to prove the kinship of Haida, Tlingit, and Athapascan. The same student has also presented further evidence for the existence of a Uto-Aztecan stock (*ibid.*, p. 306 et seq.).

Of general culture-historical significance is Porcild's attempt to establish the indigenous invention of "The Principle of the Screw in the Technique of the Eskimo" (*American Anthropologist*, 1915, p. 1 et seq.), which has been ably discussed by Lauf (*ibid.*, pp. 396-406).

Interesting data on *Family Hunting Territories and Social Life of Various Algonkian Bands of the Ottawa Valley* have been published by Dr. F. G. Speck, to whom we are likewise indebted for a collection of *Myths and Folk-Lore of the Timiskamig Algonquin and Timagami Ojibwa*. The theoretically most suggestive point in these studies is the social importance of the family hunting territory, in which all the male members share the right of hunting and fishing. There are two bonds of union in these Algonkian societies,—the family group corresponding to the hunting territory, and the gens, which is exogamous and totemic, though without any belief in descent from the totem or any taboo relating to the animal from which the group takes its name. The two types of unit are more or less permanently associated with each other, yet the hunting territory groups have distinct names and are of greater practical significance. Hunting outside of one's own territory was punishable with death. The history of the development of these divisions seems to be that their founders represented members of a few gentes of the Great Lakes Ojibwa, who had migrated northward in search of better game. After the death of the founder his tract of land was divided among his sons, each of whom founded a new family, which received a distinctive name. In the Timagami band there were three officers with definite political functions. The head chief was assisted by a deputy who officiated during his absence and acted as his speaker. Chiefs were elected for life tenure and were generally succeeded by their deputies. The third officer's duty was to collect provisions for feasts and to distribute meat among the families of the camp.

Two substantial additions to our knowledge of Central Algonkian mythology are offered in Skinner and Satterlee's *Folklore of the Menomini Indians*, and W. Jones and T. Michelson's *Kickapoo Tales*. Radin has supplied us with an

account of *The Social Organization of the Winnebago Indians*, who, while Siouan in language, belong with the Eastern Woodland tribes culturally. An interesting phase of Central Algonkian culture finds treatment in A. Skinner's *Associations and Ceremonies of the Menomini Indians*. Most of these societies are equally typical of other Woodland tribes, but there are also traces of recent Plains Indian influence. In one spectacular ceremony the performer plunges his naked arms into boiling water and takes them out unscathed. There is an important order of seers or shamans who enter into direct communication with the spirit world through the medium of the turtle and are thus enabled to recover lost property for their clients or to dispense appropriate treatment to those smitten with disease. In the latter case the cause of the suffering is extracted in the form of a worm or some small object and is either destroyed or sent against the evil sorcerer who planted it in the patient's body. Except for the Medicine Dance, the associations of the Menomini are not firmly knit and definitely organized units like the societies of the Plains, but consist simply of men who share the same supernatural experiences.

Wissler's *Riding Gear of the North American Indians* is at the same time a contribution to the recent ethnology of the Plains region and to the wider subject of cultural diffusion. The Indians seem to have adopted, without essential change, the South European and Asiatic type of saddle in vogue at the period of colonization. The main part of the riding-gear was borrowed by the tribes in direct contact with the Spaniards and thence spread as far as the Plains of Canada without important alteration. While the Indian generally mounts on the right side, this variation is merely a return to the normal method, which was deviated from in Europe simply because the sword was worn on the left side. Most interesting is the thoroughness with which the horse culture was assimilated by the American aborigines. If a non-historical people had brought it to America, the similarities between the forms in the Old and the New World would be a source of perplexity and the tendency would be to view them as independently evolved. This indicates that the theory of independent invention may become a skeptical form of dogmatism. Similar issues are discussed in the same author's *Costumes of the Plains Indians*. The typical style of the area based on the use of two skins seems to have been suggested by the natural contour of the materials used. The notion of tailoring dress so as to have it follow the lines of the body is absent in America except among the coat-wearing Eskimo and northern Indian tribes. In the Old World the practice of tailoring appears among the primitive peoples of northern Asia, but the idea of treating cloth in this way seems to have developed only in central Asia. The extensive use of rectangular ponchos seems to be due to the limitations imposed by the technology of weaving. Whether the northern tribes developed tailoring from the exigencies of climate or borrowed the processes from a more highly civilized central Asiatic people, remains a moot-problem. As regards the other aspects of the question of diffusion as against independent development, the distribution of both the two-skin garment and such minor features as the cut of skirt-bottoms over continuous regions strongly suggests diffusion.

Lowie's paper on *Societies of the Arikara Indians* establishes the former existence of hitherto unrecorded women's organizations in this tribe, one of them clearly associated with the planting of corn and both historically connected with corresponding bodies of women among the Mandan and Hidatsa. The men's organizations display some striking resemblances to those of the Pawnee, of whom the Arikara are an offshoot, but on the whole the unity of the society systems of these two tribes has become obscured, doubtless owing partly to recent contact with the Mandan and Hidatsa. Nevertheless, the Arikara did not adopt the method of grading their societies as current among these neighbors. *Dances and Societies of the Plains Shoshones* by Lowie contains a description of the ceremonial life of the Comanche, Ute, and Wind River Shoshone. This aspect of culture is very slightly developed among all the tribes concerned, only the Wind River people showing clear affinities with the police organizations found to the east and north. The most important of all the ceremonies in question, the Ute Bear Dance, is of a quite different character, symbolizing the awakening of bears after their long hibernation. In *The Sun Dance of the Crow Indians* the same author gives a detailed account of a performance briefly sketched in a last year's publication and reported in the YEAR BOOK for 1914.

A number of unsuspected features of Southern Siouan life are revealed in A. Skinner's *Societies of the Iowa, Kansa, and Ponca Indians*, the traits in question appearing in full force among the first-named people. The Iowa are not only organized in exogamous gentes but also in three more or less endogamous castes of chiefs, noblemen, and the common people, this institution suggesting possible influence from the Natchez. Moreover it appears that the military organizations are much more highly developed among these southern tribes than had been supposed. The societies are ungraded like those of the Crow Indians and share with Crow organizations a highly developed sense of rivalry both as to war exploits and in the stealing of one another's wives. In recent times all other social and ceremonial usages of the Iowa have been eclipsed by the peyote cult, involving the ritualistic eating of the narcotic peyote plant, and strangely combining Christian with ancient pagan elements of belief.

In the Southwest of the United States considerable activity may be recorded. N. C. Nelson has published his researches among the *Pueblo Ruins of the Galisteo Basin*, New Mexico. The Galisteo Basin formed the last permanent home of the Tano tribe, a Pueblo people related to the Tewa. A considerable number of ruins had been reported from this region, not all of which, however, could have been occupied simultaneously unless a quite incredibly large Tano population be postulated. It is more reasonable to assume that, though essentially sedentary, the Tano shifted occasionally from stress of circumstances. The remains of the seven settlements excavated by Nelson belong to the same type of culture, all the pueblos being large and arranged on the same plan. There is further practical identity with the culture of the Jemez Plateau. The presence of charred maize with numerous metates and mullers indicates an agricultural population, especially since there is a paucity of indigenous animal bones, indicating

the subordinate place of hunting in the economic scheme. The circular and partly subterranean kiva occurred in all but one or two sites, but its scarcity presents a contrast to the region west and northwest of the Rio Grande. Artificial reservoirs form a noteworthy feature in all the pueblos. While some of the ruins fall within the historic period, their architecture presents no marked alterations due to Spanish influence as compared with the prehistoric ruins. On the other hand, the introduction of domesticated animals from Europe is indicated by osseous remains of goats, cows, hogs, and horses.

The prehistoric art of part of this area has been exhaustively treated by A. V. Kidder in his "Pottery of the Pajarito Plateau and of Some Adjacent Regions in New Mexico" (*Memoirs of the American Anthropological Association*, vol. ii, part 6). Kidder divides the ruins of this territory into two groups, small scattered dwellings and large pueblos, and discovers a fundamental difference between their ceramic products. In the former there is a black-and-white ware such as is distributed over practically the entire Southwest and which appears to be the oldest of the types found; its decorative character is strictly geometric. The pottery of the great ruins is markedly different and may be provisionally defined as "Pajaritan" though related forms occur from the Chama and Taos in the north to the vicinity of El Paso in the south, and from Pecos and the Manzana Salt basin in the east to Acoma and the Rio Puerco in the west. Among the distinctive features of a large class of Pajaritan pottery vessels is the glaze, which was produced by mixing a flux with the black pigment so as to produce a vitrification of the lines of the ornament, while the remainder of the surface remained unglazed. The decorative motives include, in addition to numerous geometrical patterns, a number of realistic elements. In ruins of intermediate size there are again distinct ceramic types, one of which is, however, clearly related to the Pajaritan, while the other may be a more remotely connected predecessor and is almost certainly affiliated with the pottery of ancient Zuni and the Little Colorado ruins. Ethnographically the literature of the area has been enriched by a popular account of *The Hopi* by Walter Hough, one of the pioneer field-workers in this region.

For the Northwest Coast tribes we have E. Sapir's *Sketch of the Social Organization of the Nass River Indians*. Though closely related otherwise, these natives include four politically distinct groups. In social organization these Indians resemble the Tsimshian proper with whom they form a common linguistic stock. There are four exogamous units with maternal descent. Two of these bear animal names, the others have designations of unknown meaning. The exogamous groups are subdivided into families which are graded in rank and have distinctive crests, songs, and myths. Names are bestowed by the father, who necessarily belongs to a different exogamous division from his children, and accordingly they reflect the crest of the namers rather than of the individuals bearing them. The customary Northwestern division of the people into three castes of chiefs, common folk, and slaves also obtains in the Nass River country.

CENTRAL AND SOUTH AMERICA. *An Introduction to the Study of the Maya Hieroglyphs* by

S. G. Morley fills the long-felt want of a brief summary of this abstruse subject, which will be as useful to the general ethnologist as to the lay reader.

The moot-problem, whether the South American specimens composed of copper and tin indicate a native bronze technique, has been settled by Charles W. Mead's *Prehistoric Bronze in South America*. It had been assumed by some writers that the copper mined by the aborigines contained among its other impurities a certain admixture of tin while others favored the view that the two metals were obtained separately and smelted together in order to secure a harder material. Mead gathers together relevant historical data given by the old Spanish writers and presents the results of recent chemical analyses, specially conducted for the purposes of his investigations. It appears clearly that the bronze objects, especially those of Bolivian provenience, under discussion, contain a large percentage of tin, while the copper ones of the region contain none. The ruins of Machu Picchu yielded a piece of pure tin, from which presumably slices were cut by the artisan to make bronze. Finally, smelting furnaces, slag with tin, and molds for casting have been found in Argentina, where all known coppers lack tin in their impurities; thus supporting the positive statement of early Spanish sources that the Bolivians consciously mixed tin and copper. All this evidence renders it practically certain that a genuine bronze technique existed in Bolivia, the high plateau region of Peru, and Argentina.

A new line of investigation has been undertaken by M. D. C. Crawford in his *Peruvian Textiles*. Crawford examines the fabrics of ancient coastal Peru from the point of view of a modern technical expert, discussing in detail the processes of spinning, weaving, and design technique. It is clear from this attempt that in the treatment of such topics the ethnologist will henceforth have to rely largely on the coöperation of the textile specialist, lest significant features shall escape his notice.

ASIA. An aching void in ethnological literature has been filled by Miss M. A. Czaplicka's *Aboriginal Siberia*, which for the first time renders accessible a host of data hitherto buried in Russian and Polish publications and also summarizes all other information available on the social organization and religion of the natives. On the basis of this material she proposes a tentative historico-geographical classification of tribes into Palæo-Siberians and Neo-Siberians. The former, embracing the Chukchee, Koryak, Kamchadal, Ainu, Gilyak, Siberian Eskimo, Aleut, Yukaghir, Chuvanzy, and Yenisei Ostyak, represent the autochthonous population which formerly occupied a much wider territory, but was forced to retreat northward and eastward by the encroachments of the Neo-Siberians. These relative newcomers are grouped in five stocks: the Finnic, including the Ugrian Ostyak and Vogul; the Samoyedic; the Turkic, embracing in Siberia the Yakut along the Lena and southward to the Amur; the Mongolic, confined in Siberia almost wholly to the Buryat of Lake Baikal; and the Tungusic, which includes, besides the Tungus proper, the Goldi of the Amur, the Siberian Manchu, and a number of other tribes. The Neo-Siberians have caused a number of important migrations and movements of population.

Thus, the Mongolic Buryat arrived in the Lake Baikal region about the thirteenth century A.D., displaced the Turkic Yakut and caused the latter to move northward to and along the Lena River. Thus the Yakut cut into the territory of the Tungus, part of whom went west and northwest, while the rest migrated to the Stanovoi Mountains, the Okhotsk and Amur country in the extreme east.

The first comprehensive study of Philippine folklore is presented in Fay-Cooper Cole's *Traditions of the Tinguian*, a pagan tribe of north-western Luzon. The mode of thought that appears in this body of aboriginal literature corresponds closely with that still current among the people. The tales are of three types,—those dealing with the mythological period; the ritualistic and explanatory tales, of which the mediums possessed by spirits during ceremonies are the depositaries; and folk-tales representing the native store of fictitious narratives without serious meaning. The last group shows much similarity with alien tales, some stories being borrowed from the Christianized Ilocano, while others even suggest in a startling manner incidents in American Indian plots, though not to a sufficient degree to indicate historical connection in the present stage of our knowledge. The mythical stories seem to enable the reconstruction of a remote period of the Tinguian past, in which the people did not yet have terraced rice-fields, were ignorant of the domestic work animals, and had not yet made the acquaintance of the horse.

OCEANIA. Dr. W. H. R. Rivers has contributed a work of fundamental significance in *The History of Melanesian Society* (2 vols.). It records new field data, particularly on the secret organizations of the Banks Islands and the culture of the hitherto all but unknown Island of Tikopia, which is proved to be closely related to that of Tonga. More important than the additions of fact, however, is the analysis of Oceanian culture into a number of component strata superposed upon one another by successive migrations. The author here applies the principle that far-reaching effects may be produced by small bodies of immigrants and discusses the mechanism by which new conceptions are introduced, pointing out how contact of different cultures results in features formerly lacking in both. Polynesian culture is regarded as a compound of two elements, while Melanesian culture is considered the joint product of two successive migrations among an earlier people possessing an organization of society into exogamous matrilineal moieties. The later Polynesian stratum is affiliated with the earlier Melanesian immigration, while the earlier Polynesian stratum entered into the structure of the old dual people, whose culture in turn is explained by the fusion of two distinct peoples.

AFRICA. In his "Recherches Préhistoriques" (*L'Anthropologie*, 1915, p. 193 et seq.) Pallary establishes a number of important conclusions as to the archæology of Morocco. He finds that this region was already occupied as far as the foot of the Atlas Range in the most ancient paleolithic periods. The abundance of stone implements by itself indicates a very long habitation. Neolithic stations are rare, and in the south neither ground axes nor arrow points were discovered. A considerable number of Berber ruins and tumuli show that the population of

ancient times rather exceeded that of the recent era.

A highly significant inquiry as to the distribution and character of African totemism is given in Ankermann's "Verbreitung und Formen des Totemismus in Afrika" (*Zeitschrift für Ethnologie*, 1915, pp. 114-180), which is practically the first summary of known data as to African social organization. Ankermann finds that the conditions in the Dark Continent corroborate Frazer's view as to the independence of totemism and exogamy. In Africa totemism is almost uniformly associated with paternal descent; systems in which the rule of totemic inheritance is mixed indicate confusion of a patrilineal totemic organization with a matrilineal non-totemic system. Whether the Bushmen and Pygmies were totemic, remains undecided. Apart from them probably all of Africa south of the Sahara formed a continuous totemic area prior to the advent of Christianity and Mohammedism, which have reduced this feature to a mere vestige, as among the Islamized Mandingo. The highly developed animal cult of ancient Egypt suggests that region as the possible point of origin of totemism. However, the essential belief of a blood-relationship with the sacred animal was certainly lacking in historic times and the hypothesis of an Egyptian starting-point would involve the auxiliary assumption that totemism existed in a far more remote epoch and that all the transitional forms leading to the later animal cult disappeared. As a member of Graebner's school, Ankermann attempts to assign to African totemism a place in some one definite cultural layer. The simplest supposition would be to assign it to the stratum of the primitive negro from whom both Sudanese and Bantu developed by differentiation, i.e. the second African stratum immediately succeeding that of the autochthonous Pygmies. The feature is characterized in this scheme by a union of totemism with exogamy and patrilineal descent. Unfortunately a difficulty arises because the totemic group is in a number of instances a unit of higher order than the exogamous clan. We are thus obliged to assume a totemic layer superimposed on the culture of an exogamous patrilineal non-totemic people. Since the peoples in question are clearly composed of a substratum of negroes lorded by a Hamitic caste, it seems plausible to regard the Hamites as the carriers of totemism, but here another obstacle develops from the fact that no purely Hamitic people is known to possess a totemistic organization. Ankermann is thus led to revert to the hypothetical totemism of prehistoric Egypt. Now early pictures of the Old Kingdom never represent negroes but only Semitic and Hamitic types, and Egyptologists only assume an infiltration of negro elements into Nubia towards the end of that period. If, therefore, the prehistoric Egyptians possessed a totemic system antecedent to their animal cult, it cannot have been derived from negroes but must have originated with one of the earlier ethnic factors of the Egyptian population. We should thus be driven to assume that the Hamites were in fact the transmitting agency in the spread of African totemism unless the alternative be adopted that it came from Madagascar, where it might have been carried originally by the Malays or may have constituted a pre-Malayan element. On the whole, however, Ankermann is disposed to disregard

this line of argument, partly on account of its largely hypothetical character, but also because of the many features shared by the totemic stratum of Africa with the so-called West-Papuan stratum of Oceania, to which a very high antiquity must be conceded. It seems hardly admissible to attribute this entire complex of cultural traits to the Hamites, hence totemism is probably after all an element of ancient negro stratum.

MEETINGS, EXPEDITIONS, PERSONALIA. The International Congress of Americanists met at Washington, D. C., December 27-31, in connection with the Second Pan-American Scientific Congress, the American Anthropological Association, and the American Folk-lore Society.

For obvious reasons practically no expeditions were undertaken by citizens of the belligerent European countries. We may record, however, the safe return to England of Miss M. A. Czaplicka from a successful trip to the Yenisei Ostyak and Tungus of Siberia. American operations have been but little affected by conditions abroad. The Bureau of American Ethnology supported Dr. J. R. Swanton's Muskogean field-work in Oklahoma and Dr. T. Michelson's linguistic researches among Algonkian tribes. Under the auspices of the New York Academy of Sciences and the partial collaboration of the American Museum of Natural History, Prof. F. Boas, assisted by Dr. H. K. Haeberlin, Dr. J. A. Mason and Mr. R. T. Aitken, has investigated the physical anthropology of Porto Rico, as well as laid the foundation for intensive archaeological research. The American Museum of Natural History equipped expeditions to the Zuffi (Prof. A. L. Kroeber); the Hopi (Dr. R. H. Lowie); continued archaeological activities at Trenton, N. J., and the vicinity of New York City (Messrs. L. Spier and A. Skinner); conducted excavations of New Mexican sites (Mr. N. C. Nelson); and continued work on Pawnee ceremonialism (Dr. C. Wissler and Mr. J. Murie). For the University of California Mr. W. E. Gifford studied the social organization of the Miwok, Yokuts, and Mono, while Dr. E. Sapir investigated the Yahi dialect of Yana from the lips of the last survivor of the tribe. The Geological Survey of Canada supported Mr. C. M. Barbeau's studies of the social life of the Tsimshian. Various explorations, mainly archaeological, were conducted on behalf of the George G. Heye Museum by Messrs. G. G. Heye and Pepper in Georgia, Mr. T. De Booy and Prof. M. H. Saville in the Antilles and South America, and Mr. M. R. Harrington in Cuba.

American anthropology lost its dean through the death of Prof. F. W. Putnam, formerly the head of the anthropological departments at Harvard and the University of California, and the organizer and stimulator of an infinite number of anthropological investigations and institutions. The growing recognition of the scientific status of anthropology is reflected in the award of a Royal Society's Medal to Dr. W. H. R. Rivers.

ANTI-BOYCOTT ASSOCIATION, AMERICAN. SEE EMPLOYERS' ASSOCIATIONS, section so entitled.

ANTIDOTES. See FULLER'S EARTH.

ANTIGUA. A presidency of the Leeward Islands colony, consisting of the islands of Antigua, Barbuda, and Redonda. (See LEeward ISLANDS.) The inhabitants are chiefly negroes. St. John, the capital (also the capital of the

Leeward Islands), had, in 1911, 7910 inhabitants. About 52,000 acres are under cultivation, the products including sugar, cotton, and pineapples. There are no rivers and few springs, and droughts are frequent. Revenue (1913-14), £52,218; expenditure, £51,017; imports, £167,577; exports, £138,219.

ANTI-MILITARISM. See *SOCIALISM, passim*; and *UNITED STATES, History*.

ANTISEPTICS. **HYPERTONIC SALINE SOLUTIONS.** During the European war now in progress, the antiseptic value of salt solutions, of more than ordinary strength, has received serious consideration. It has been noted that sailors suffering from injuries and often from shock incident to prolonged immersion in salt water, have recovered promptly from the most severe wounds; whereas soldiers receiving even slight wounds, often undergo a lengthy period of convalescence or die. The difference in environment may account for this. The soldier's wounds nearly always become dirty, owing to the peculiar conditions of trench warfare in soil where an intensive process of cultivation has been carried on and which swarms with anaerobic bacteria. Both the English and French surgeons report particularly favorable results in the military arm following the use of sea water or hypertonic saline solutions. A memoranda appearing in the London *Lancet* advised the application of a 5 per cent solution of common salt to which 0.5 per cent sodium citrate is added to prevent coagulation of serum. When citrate of soda is not available, a 5 per cent solution of salt is advised. Sea water may also be employed, this being equivalent to a 2.5 per cent salt solution. Dry and infiltrated wound surfaces call for solutions up to 10 per cent in strength. Deep, open wounds are best treated, after the removal of foreign bodies, by filling them with a hypertonic salt solution and plugging them lightly with gauze. Superficial wounds call for a simple application of gauze saturated in the solution. It is noted that a free flow of serous fluid takes place from the wounds, and the dressing must be changed frequently, and the skin covered with vaseline to protect it from irritation. Such wounds become rapidly healthy and clean and are then covered with a simple dressing. In France, Abadie reports good results from treating wounds with concentrated solutions of sea salt which, being hypertonic, promote exosmosis and diapedesis, there being a free flow of lymph and escape of the phagocytes into the wounds. Abadie irrigates the cavity with a 0.7 per cent solution of sea salt and then packs it with gauze moistened in a solution of from 14 to 28 per cent. He advocates it, not only for fresh wounds, but for old infected injuries. Morestin has had excellent results in old wounds and varicose ulcers. The salt rapidly modifies wounds which are atonic or covered with unhealthy granulations. See *SURGERY*.

The relative value of antiseptics for emergency wounds which cannot be treated immediately has also received careful study. The British government supplies each man in the army and navy with two packages, the first containing a paste composed of 20 per cent phenol in lanolin, to which may be added sufficient white wax to stiffen it; the second, a powder composed of equal parts of boric acid and salicylic acid. Keilty and Packer experimented with various

antiseptics to determine their relative inhibitory and germicidal power as well as their diffusibility. The organisms used were cultures of the staphylococcus aureus, streptococcus pyogenes and bacillus coli. The drugs tested were numerous and included the following classes: (1) Those drugs which are markedly active, examples of which are: tricresol, 10 to 20 per cent; thymol, 10 to 20 per cent; creosote, 25 per cent; mercuric iodide, 10 to 20 per cent; tincture of iodine, 5 to 10 per cent. (2) Those drugs which are slightly active: salicylic acid, 20 to 30 per cent; Japanese powder (salicylic and boric acid—so called because of its use in the Russo-Japanese War), 20 to 30 per cent; zinc chloride, 20 per cent; mercuric chloride, 0.2 to 0.4 per cent; guaiacol ointment, 10 per cent; mercuric ointment, 33 per cent; creosote, 10 per cent; carbolfuchsin (which contains 5 per cent of phenol). (3) Drugs which are inactive: iodine, 2 to 6 per cent; menthol and camphor, of each 20 per cent; boric acid, 30 per cent; iodoform, 90 per cent; zinc sulphate, 1 to 5 per cent; alcohol, 95 per cent; calcium chloride, 20 per cent; liquor formaldehyde, 0.1 and 0.5 per cent (in solution 1:1000, 1:500); lead nitrate, 5 to 10 per cent; silver nitrate, 5 per cent (in solution, 20 grains to 1 ounce); turpentine, 1 per cent; ether; chloroform; Delafield's hematocrylin; Sudan III; Loeffler's methylene blue; eosin, watery solution; iodine green; glycerin; bismuth betanaphthol, 20 per cent; salol, 20 per cent; hexamethylenamin, 20 per cent; zinc oxide, 25 per cent; scarlet red (2 per cent scharlach R); bismuth subnitrate, 50 per cent; balsam of Peru ointment, 25 per cent; scharlach R, saturated solution.

Summarizing their work, the authors concluded that, of the more important drugs, thymol and tricresol were very active, both alone and in combinations; and had the advantage of being very diffusible. Another notable finding was that scarlet red, much advocated as an antiseptic, had a very slight inhibitory action on the growth of bacteria. The authors recommend a paste or ointment composed of thymol and tricresol, of each 10 per cent, incorporated into a base composed of 70 parts of castor oil, 20 parts of white wax, and 10 parts of spermaceti.

ANTITOXIN. See *DIPHTHERIA*.

APPENDICITIS. Noteworthy contributions to the study of the causation of appendicitis have been recently made in the United States. The older view of causation by foreign materials, such as fecal concretions, seeds, etc., is now practically abandoned and interest centers in the bacteriology of the disease. The microorganism most frequently found in the appendix is the colon bacillus, sometimes in pure cultures, in other cases associated with streptococci or staphylococci. In the majority of cases the infection is mixed. Rosenow studied the fluids and tissues in and about the appendix and introduced isolated strains of microorganisms into the general circulation of animals. He further discovered that in the lumen of the appendix the colon bacillus predominated, while in its walls the chief bacteria were streptococci. The elective affinity of bacteria for certain tissues of the body is discussed in the article *BACTERIOLOGY* (q.v.). Rosenow's experiments indicate that appendicitis is commonly a blood-borne infection, secondary to some distant focus such as the tonsil. In comparison with the appendix, no part

of the gastro-intestinal tract is so rich in lymphoid tissues except the tonsillar region in each of these anatomic localities, especially in the young in whom lymphoid tissue is abundantly developed. The colon bacillus is looked upon as a secondary invader and experimentally it is almost impossible to produce appendicitis by introducing these bacilli into the blood stream without injury to the mucous membrane of the appendix. Rosenow's work is another link in the chain of evidence that attacks of appendicitis as well as other affections of the abdominal viscera are most probably produced by bacteria which find their way into the circulation from a focus of suppuration, in the teeth, tonsils, or other portions of the upper respiratory and gustatory tracts. See BACTERIOLOGY.

APPLES. See HORTICULTURE.

AQUEDUCT. The Catskill Aqueduct supplying the city of New York was practically completed at the end of the year 1915, and its use to supply the city with water was predicted for the following year, although it was expected that most of the time tests of the installation and equipment would be required and general practice in its operation concluded. In fact at the end of 1915 Catskill Aqueduct water was entering into the distribution mains of the city so that the testing and general tuning up of the system could be undertaken. The last step in the construction of the aqueduct proper was the building of a by-pass tunnel around the leaky section of the Moodna pressure tunnel on the west bank of the Hudson River, just previous to where the line of the aqueduct passes beneath the river bed. The new tunnel, 17 feet in diameter and 900 feet in length, was driven 400 feet below the original section. The old shaft which had been sealed was used in handling the material, and a new shaft was sunk from the old tunnel to make the connection with the supplementary tunnel below. The old sections were sealed and the new portion was found in satisfactory working order by the end of the year.

Large quantities of water were stored in both the Ashokan and Kensico reservoirs.

The Kensico Dam was nearing completion, and it was expected that within two years at the outside it would be entirely finished. This dam had reached a point where the architectural features of its exterior could be appreciated, and it was unique among American structures of this class for the fact that some pains had been spent in its ornamentation, and the massive masonry structure was architecturally treated so as to afford a pleasing appearance.

Quite in contrast with the Kensico Dam and Reservoir was the Hill View Reservoir, of 900,000,000 gallons capacity, which serves as a pressure equalizing reservoir for the aqueduct system, and at the same time affords two or three days' supply for the city or for emergency use in case of a large fire or other service. This reservoir is formed by earth embankments and required about 3,000,000 cubic yards of excavation. It is an earth embankment with an impervious 4-inch inner-face of concrete. It began to fill on Nov. 30, 1915.

The flexible submarine pipe line under the narrows of New York Harbor carrying the water from Brooklyn to the Borough of Richmond was also completed, while the Silver Lake Reservoir on Staten Island was more than half finished.

The distribution tunnels under Manhattan were completed at the end of the year though work remained to be done on the distribution system, and the connections, valves, etc. The city tunnel was under pressure as far as the shaft near 93rd Street, and tests were beginning to be made of the connection with the distribution mains in the city streets.

LOS ANGELES. With the successful completion of the Los Angeles Aqueduct the problem of disposing of the surplus waters interested the government of that city. During the year a district involving more than 100,000 acres, including all the irrigable area of the rich San Fernando Valley, between the northwestern limits of Los Angeles and the outlet of the aqueduct, and extending west of the aqueduct, voted to annex itself to the city of Los Angeles. This district agreed to assume a proportionate share of the cost of the aqueduct in addition to \$2,660,000, previously voted for the installation of a distribution system of steel pipes. The Los Angeles Water Department immediately began on the construction of a temporary unlined conduit from the lower San Fernando Reservoir, so that some 10,000 acres could be put under irrigation immediately.

In connection with the plan of developing power from the Los Angeles Aqueduct, the first hydraulic plant in the proposed chain of stations was built in the San Francisco Canyon for a 100,000 volt transmission line to convey current to the city 47 miles distant. This plant was designed for six 7500 kilowatt units working under a head varying from 914 to 814 feet. This plan was made possible by the California State Supreme Court validating a \$6,500,000 bond issue, of which \$1,250,000 was for completing the generating station and transmission line, and \$5,250,000 for providing or acquiring the distributing system in Los Angeles.

SAN FRANCISCO. During the year 1914 work was begun on the much discussed Hetch Hetchy water supply project for the city of San Francisco. A main road was constructed to the dam site, 9.09 miles, and a saw mill was erected for utilizing timber in the area owned by the city. A diversion dam was to be constructed to direct the waters of the Tuolumne River into a tunnel around the main dam site while the large impounding dam was being constructed. This dam was to be of gravity section, arched to afford additional safety, and was estimated to cost approximately \$4,000,000, but the plans were only tentative and were subject to final approval by the expert engineer to be named by the city. These tentative designs called for a structure 750 feet long on the crest and 300 feet in height. Work was begun on the Early intake which is a tunnel through rock 10½ to 13 feet in diameter, 20 miles in length, extending from a point 12 miles below the dam to a forebay above the Moccasin Creek power plant; and also on the diversion tunnel, 20 feet in diameter, to the Tuolumne River, during the construction of the main dam. In addition to the water supplied to the city a power development was planned which will ultimately develop a total of 72,000 kilowatts. For the construction, a railway 67 miles in length extending from the junction of the Sierra Railway at Rosasco to the dam, has been decided upon, as the transportation of much material will be required in the construction.

CANADA. Winnipeg. During the year 1915 the project for the construction of the 100-mile Winnipeg Aqueduct was thoroughly organized and work was begun. The general plan was recommended in 1913 by a board of consulting engineers consisting of Rudolph Hering, Frederick P. Stearns, and James H. Fuertes, and comprised essentially a low diversion dam at Indian Bay, an arm of Shoal Lake; 85.036 miles of horseshoe-shaped concrete aqueduct, the largest section of which is 10 feet, 9 inches wide and 9 feet high inside; some 10 miles of 5-foot steel pipe; 900 linear feet of tunnel under the Red River; and 12,000 linear feet of cast iron pipe leading to the city reservoir. The carrying capacity of the aqueduct is 102,000,000 gallons in 24 hours, which will be an ample supply through the year for 850,000 inhabitants. This aqueduct was to supply not only the city of Winnipeg but several municipalities which combined to form the Greater Winnipeg Water District, though of course Winnipeg, with a population of 200,000 out of 225,000 in 1913 in the area to be supplied, is the largest consumer, the other cities being St. Boniface, Transcona, St. Vital, Assiniboia, Fort Garry, and Kildonan.

The work requires the construction of a railway about 105 miles long, including sidings, the last spike of which was driven on Dec. 17, 1914. The estimated cost was \$13,045,600, and the plan of construction was somewhat novel in that the aqueduct administrative board in behalf of the district not only builds and operates the construction railroad, but purchases all cement directly, supplies the contractor with sand and gravel, and will grade this material in the proper proportion for use as concrete aggregate. The direct purchase of the cement was decided on in order to secure uniform sound waterproof construction.

The construction of the aqueduct naturally has been influenced by topographical conditions. Near the district to be supplied the ground and river water is so hard that it is unsuitable for manufacturing and laundry purposes, and not very satisfactory for domestic uses. The nearest suitable water supply was to be found to the east and north of Winnipeg, in the granite country, at about 300 feet higher level than the city. Consequently the available slope is only about 3 feet to the mile, and this head is consumed in delivering the water into the city reservoir. It was hoped that the aqueduct would be finished before the fall of 1918, and the whole organization of railway and construction was so provided that there would be as little chance for delay as possible.

Brooks Aqueduct. An interesting feature of the great irrigation development in the Province of Alberta, Canada, was the Brooks Aqueduct, which is the first aqueduct in which the hydrostatic catenary has been adopted for the shape of the water section, and it is the longest aqueduct yet constructed, with a large carrying capacity, having a length of 10,500 feet, and a capacity of 900 cubic feet per second. This aqueduct forms a part of the western section of the Bow Valley irrigation block, which includes the horseshoe bend on the Bow River at Bassano, where the great dam is located, and Lake Newell, an artificial reservoir constructed in a large natural hollow.

The water section of the aqueduct was selected in the form of a hydrostatic catenary or curve,

as the total fall was limited to 4.85 feet in 10,000, and consequently it was necessary to use this small head to the very best advantage. This shape afforded a low friction head and structurally was economical. To carry the water conduit various arches and trestle designs were worked out, but the trestle system was chosen, as this was found about 25 per cent cheaper than arches.

Ottawa. During the year progress was made towards increasing the water supply of the city of Ottawa, the result of a threatened 50 per cent increase in fire insurance rates which had aroused the efforts of local insurance interests and the Board of Trade. Contracts were let during the year for building a pumping station on Lemieux Island in the Ottawa River, and laying a force main thence to the mainland, crossing the river channel on a bridge in order to avoid the dangers of a submerged pipe line beneath Nepean Bay. This was the fifth water supply project proposed for the city of Ottawa within a few years, as the voters had defected bond issues for a near-by lake gravity supply and for a mechanically filtered supply from the Ottawa River; while the city administration had discarded plans proposed for a distant-lake gravity supply and a modified filtered supply from the Ottawa River.

ITALY. The great Apulia Aqueduct, which was being constructed to supply water from the river Sele to about 3,000,000 inhabitants of cities and towns in several arid provinces in Southeastern Italy, was put to use on April 13, 1915, when water was turned in. The project, which involves the construction of an aqueduct and many branch lines, with a combined length of about 1800 miles, was not completed and construction was being continued. This project dates back to 1868, and has involved many extensive surveys and geological examinations of the territory from which the supply is drawn. The general plan involves the collection of water by means of a series of canals which lead into a connecting canal, and this in turn into a supply canal. The main canal runs from Caposele to Fasano, a distance of 132.67 miles, of which 6.02 miles are tunnel, 5.28 miles canal bridges, and 4.59 miles are siphons. The supply of water from the main canal goes to 260 towns and three provinces in Apulia, through a system of branch canals, independent reservoirs, pumping stations, pipe lines, siphons, and tunnels. The construction of this wonderful aqueduct has involved extraordinary masonry and concrete work, tunneling, and other varieties of constructive engineering.

INDIA. The Gaulapar Aqueduct, which carries a supply of water for the irrigation of 7000 acres of Bhabar land, on the east of the Gaula, in the Haldwanitahsil, was opened during 1915 by the Viceroy of India. This aqueduct includes probably the second largest reinforced-concrete arch in the world. Twelve concrete-arch bridges and aqueducts had been built in the Tarai estates by the Indian Irrigation staff. The Gaulapar Viaduct was designed and carried out by Mr. W. L. Stampe, executive engineer of the Tarai and Bhabar government estates, and the construction was commenced in November, 1914.

ARABIC CASE. See UNITED STATES AND THE WAR.

ARBITRATION, INTERNATIONAL. See INTERNATIONAL PEACE AND ARBITRATION.

ARBITRATION, LABOR. See RAILWAYS.

ARBITRATION AND CONCILIATION, INDUSTRIAL. The large number of strikes during the year brought clearly before the country the fact that in addition to loss in actual money and lives, millions are lost in disrupted productivity, deterred investment, crippled business, and animosities bred by strife. The violences of Colorado, West Virginia, and New Jersey do not confine their harmful effects to those States, but make a direct appeal to the sympathies of all workers and employees in the United States, thus intensifying the class struggle. For this reason there never was a time when more general public interest attached to various plans for collective bargaining. This principle embodies the right of laborers to sell their labor as a whole and not individually. About 350 employers testified before the United States Commission on Industrial Relations, including such great captains of industry as J. P. Morgan, John D. Rockefeller, Jr., and George W. Perkins, and freely admitted that the employing side of business should be conducted on a collective basis. Many also admitted that labor had the right to organize and yet as a result of an antagonistic attitude toward such organization on the part of some employing concerns, employees remained unorganized. The trouble seems to lie in the fact that collective bargaining is conceived in terms of unionism, closed shop, and walking delegates, and there does not seem to be a comprehension of the fact that a compromise exists which will safeguard the rights of the employer and the worker without injustice to either. The Hart, Schaffner, and Marx clothing house of Chicago, which was one of the two large houses not entering the Chicago clothing strike (see STRIKES AND LOCKOUTS) of the latter part of the year, was converted to a system of arbitration some time ago. Mr. Schaffner said, "Industrial peace will never come so long as employer or employee believes he is being deprived of rights honestly belonging to him. Arbitration and conciliation should be applied to all departments of business wherever there is a conflict of interests. It insures exhaustive discussion of every matter of importance, gives everybody a chance to express his opinion, brings to light valuable suggestions, and makes possible a higher degree of coöperation and team work." Where collective bargaining has been tried it has uniformly resulted in increased efficiency, higher productivity, higher wages, and higher dividends. The retention of the traditional autocracy of the employer is thus an impediment to industrial progress from the standpoint of his own interests as well as those of his employees and the public. It is worthy of note that although the members of the Commission on Industrial Relations (q.v.) split into various factions, they all agreed in approving collective bargaining.

DEPARTMENT OF LABOR. The act of March 4, 1913, creating the Department of Labor, provided that the Secretary of Labor should have power to act as a mediator in labor disputes. Under this authority the Department, through its commissioners of conciliation, offered its services during the year ending June 30, 1915, in 32 labor disputes involving nearly 100,000 workmen. Of these disputes 24 were amicably adjusted. In five settlement was pending, two could not be settled, and in one mediation was

refused. From July 1 to Nov. 13, 1915, the Department handled 42 disputes involving over 40,000 workers. These disputes comprised a wide variety of industries and processes, as pattern making, dyeing and mercerizing, silver plating, boiler making, iron molding, wireless operators, steam and electric railways, textile mills, plumbing, coal mining, and the manufacture of firearms, lace, locks, and graphophones. Among the notable disputes settled by the Department was that in the Eastern Ohio coal field of more than a year's duration and involving 16,000 men (see STRIKES AND LOCKOUTS).

WESTERN RAILROADS. The most important single instance of arbitration in the United States during the year was that at Chicago involving the 64,000 locomotive engineers, firemen, and enginemen of 98 western railroads. An arbitration board consisting of the vice-presidents of the Illinois Central and the Burlington roads, representatives of the Brotherhood of Locomotive Engineers and the Brotherhood of Firemen and Engineers, Secretary of Labor Nagel, and Judge Pritchard of Virginia, chairman, reached a compromise agreement April 30. The employees' representatives refused to sign the award, which covered wages, overtime, transfers, seniority, pay for delays, and other items. The award holds for one year only, when it is expected the contest will be renewed.

COLORADO INDUSTRIAL DISPUTES INVESTIGATION ACT. The Legislature of Colorado enacted a law embodying provisions relative to labor disputes that differs from any other existing legislation in this country and resembles in several respects the well-known Canadian Industrial Disputes Investigation Act. The act creates an industrial commission with a wide range of powers. Among the duties is the promotion of the voluntary adjustment of labor disputes, with a view to avoiding the necessity of resorting to strikes, lockouts, boycotts, blacklists, discriminations, and legal proceedings in matters of employment. The commission may act directly, or it may appoint temporary boards of arbitration, providing also for their necessary expenses. Power to enforce the attendance of witnesses, administer oaths, and other court powers are conferred on the commission or a board appointed by it. Parties to proceedings may be compelled to give evidence as witnesses, and evidence is not restricted to that of a strictly legal nature, but such as seems to fit in equity and good conscience may be accepted. Employers and employees must give at least 30 days' notice of any intended change affecting conditions of employment as regards wages or hours. If an investigation has been begun, and until the dispute has been finally dealt with by the commission or board, the existing status must be maintained, and the relationship of employer and employee continued "uninterrupted by the dispute." Any attempt at delay in order to maintain a continuation of the status is punishable as a misdemeanor. It is also unlawful for an employer to declare or cause a lockout, or for an employee to go on strike, prior to or during an investigation, hearing, or arbitration of such dispute. Employers may declare lockouts and employees may strike without violating the statute if they choose to do so after a dispute has been duly investigated, heard, or arbitrated. Determinations by the commission or a board are binding only when the parties to a dispute have

either agreed in writing prior to action that they will abide by the conclusion reached, or have accepted the action of the commission or board after the same has been made known to them. Penalties are provided for violations of the act by employers or by employees, as well as by any person who incites employers or employees to act in contravention of the law.

ROCKEFELLER PLAN. Following the conclusion of the strike in the Colorado Fuel and Iron Company's camps, Mr. John D. Rockefeller, Jr., during an extended inspection of conditions, presented his Industrial Representation Plan whereby he thought to create a "Republic of Labor," in which every citizen is to be free and independent. This is a very comprehensive scheme for handling all of the relations of employers and employees. It is based on the theory that every corporation is composed of four parties, namely, stockholders, directors, officers, and employees, whose interests are so mutually bound together that an "effort to advance one interest at the expense of another means loss to all."

The plan provides for an annual meeting of employees for the election of representatives. Each camp is to choose one representative for every 150 wage-earners, the balloting in such elections to be secret. The camps are divided into five districts, and district conferences are to be held within two weeks following the annual election of representatives and within every four months thereafter. In such conferences the representatives of employers shall not exceed the number of representatives of employees. These conferences shall consider all matters of mutual interest, including working and living conditions, discipline, the avoidance of friction, promotion of efficiency, and of friendly relations. These conferences shall provide for the following four joint committees of six members each: on industrial coöperation and conciliation; on safety and accidents; on sanitation, health, and housing; on recreation and education. Each of these committees may of their own initiative consider all matters in any way pertaining to the general field.

The settlement of industrial disputes is dealt with at great length in the plan. In the first place it is provided that the company and its employees shall strictly observe the Federal and State laws. In the second place there is to be no discrimination against an employee on account of membership in any union or society; but all features of the management of the business are reserved exclusively to the company. Offenses for which an employee may be dismissed shall be conspicuously posted at each property. Employees may assemble outside of working hours at appropriate places on the company property or elsewhere. They are not obliged to trade at company stores. They may employ checkweighmen. Finally, elaborate provision is made for a series of appeals for any grievred employee. The plan provides that the president of the company shall have a special industrial representative who must visit each camp at least once every three months. The plan then provides that adjustment of a grievance shall be sought first with conference through the mine superintendent; then through the president's industrial representative; then through the division superintendent, assistant manager, or manager, general manager, or presi-

dent of the company in consecutive order. If all these fail the joint committee on industrial mediation and conciliation of the district shall take up the case. If they divide evenly on the matter they shall call in an umpire. If this does not succeed the matter may be referred to arbitration or made the subject of investigation by the State Industrial Commission.

Considerable attention is given to social and industrial betterment. A special executive assistant to the president is to coöperate with a permanent advisory board with reference to sanitary, medical, educational, social, religious, and other needs of the various communities. The publication of a periodical to serve as communication between the management, employees, and the public is also provided. The first quarterly number of this periodical, called the *C. F. and I. Industrial Bulletin*, was issued in October.

In addition to these general features the plan provides special features of an agreement to continue in force until Jan. 1, 1918, and thereafter subject to revision upon 90 days' notice by either party. These special features include the charges for dwellings, electric light, water, powder, and domestic coal; agreement of the company to fence lots for gardens and to remove garbage; and to provide bath houses and social centres. An eight-hour day for underground employees, and a nine-hour day for others is established. Wages are not to be reduced during the term of the agreement, but may be raised in proportion to the advances in competing districts.

The plan includes three of the seven demands presented preceding the strike of 1913-14, and a part of a fourth. It does not recognize the union, advanced wages, nor pay for dead work, while the abolition of the guard system is not touched upon. While Mr. Rockefeller claimed the plan to be "more democratic than unionism," critics did not believe it afforded adequate protection to representatives of the men serving on committees, nor indeed of any workers deemed too active. Moreover, while the company assumed the expenses for the operation of the plan, it at the same time retained complete control. It was believed thus to introduce a degree of paternalism and guardianship not entirely in harmony with free democratic institutions. Moreover, the plan did not include the several thousand employees of the company in the steel works at Pueblo. The plan was, however, unanimously adopted by representatives of the company and of employees at Pueblo on October 2. It was then submitted to the directors of the company and to a referendum vote of the miners, being approved in both cases.

NEW YORK CLOTHING INDUSTRY. One of the most elaborate and effective trade agreements ever completed in the history of American industry was the protocol established between the Cloak, Suit and Skirt Manufacturers' Protective Association of New York City and the International Ladies' Garment Workers' Union and the Cloak and Skirt Makers' Union in September, 1910, and continuing to May, 1915. Termination of that agreement led to strikes and threatened disruption of the industry, with the result that Mayor Mitchel appointed a council of conciliation with a view to establishing a new collective agreement. This council consisted of Felix Adler, chairman, Charles L. Bernheimer, Louis D. Brandeis, Henry Bruère, George W.

Kirchwey, and Walter C. Noyes. They secured the adoption of a new agreement to be in force for two years with renewal for a like term unless two months' notice of desire to abrogate is given by either party. A wage scale representing an advance of approximately 10 per cent over the preceding agreement is fixed. The Union agrees to avoid strikes, but the workers are guaranteed "an inalienable right to associate and organize themselves," and shall be immuned from discharge or discrimination on account of union activities. Complaints shall be investigated first by representatives of the two parties, and, if settlement is not reached, by a trial board consisting of one employer, one worker, and an impartial person. The employer, on the other hand, is given complete freedom in the selection of employees; the right to discharge the incompetent, the insubordinate, the inefficient, the unsuitable, and the unfaithful (which, however, he agrees not to exercise in an oppressive manner); the right to distribute work among the employees possessing the requisite skill; but he agrees to distribute work during slack seasons as equably as expedient; and he may reorganize his shop whenever conditions of business make it necessary for him to do so. The council which planned this agreement was requested by the mayor to continue as an investigating commission in order to increase the regularity of the industry, fix wages and other standards, and encourage trade education and more thorough organization throughout the industry.

DENMARK. Denmark recognizes practically the same principles of State interference in the settlement of labor disputes as does the Australian Commonwealth. A permanent arbitration court was established by the law of April 12, 1910. It consists of 12 members. Three associates and their alternates are elected annually by the Association of Danish Employers and Masters; the other three and their alternates are chosen by the Danish Federation of Labor, as long as these organizations represent the majority of employers and workmen on either side; and when they cease to do so, steps are to be taken for a change in the law. Since the organization of the court, 136 cases have been decided by it. During the years 1913-14, 48 cases (24 in each year) were referred to the court for decision. During the same years 31 proceedings were begun by employers' associations or individual employers, and 17 by trade unions; 8 cases were settled by the parties before final proceedings were had, 4 were dropped, and 1 was postponed. During the same two years, the largest number of disputes occurred in the building trades, where 22 cases were represented; transportation and the woodworking trades came next with 7 and 5 cases, respectively. The questions at issue were strikes and lockouts in 20 cases; interpretation of agreements or awards in 17 cases; alleged boycotts, 5; working conditions, 2; wages, 1; blacklisting or dismissal, 1; employment of non-unionists and non-compliance with the award of the court, 1. Fines were imposed during 1913 and 1914 in 15 cases, amounting approximately to \$1207. The total costs involved in the settlement of the 48 cases during the same two years amounted to \$1217, of which \$282 was assessed on employers alone, \$662 upon trade unions alone, \$229 upon both employers and trade unions in equal

amounts, while \$44 was assessed upon both parties unequally.

NORWAY. The enactment, Aug. 6, 1915, of an arbitration law in Norway is of special interest, as it recognized the principle of compulsory investigation and enforced delay in striking, which forms the essential feature of the Canadian Industrial Disputes Act of 1907. As originally drafted, the Norwegian law was a compulsory arbitration law, but opposition to it from the time of its proposal in 1910 compelled the omission of the compulsory feature. For its purposes, the law provides for the registration of trade unions and employers' associations and the legal recognition of the collective agreement; conciliation is a prominent feature of the act. In order to incorporate, a trade union must have at least 25 members. Collective agreements are required to be in writing and remain effective for three years unless otherwise provided, and three months' notice is required before their lawful termination. It is specifically provided that an individual contract of hire cannot waive the provisions of the collective agreement. Resort may not be had to a strike for determining the application or intent of a collective agreement, nor may it be resorted to under any circumstances unless conciliation proceedings be first attempted; and as long as the right to strike is in abeyance, it is not lawful to make changes in the conditions of work or wages of the employees, a provision inserted to prevent a so-called masked lockout. The labor court established under the act is the only tribunal before which the questions arising from an unlawful strike may be tried; but the parties themselves are left free to settle their disputes out of court by voluntary arbitration. The organization as such, and not an individual representative of it, is alone recognized before the court. The court consists of a chairman and four associates appointed by the Crown for a period of three years, two being nominated from trade-union members, and two from employers' associations. The country is divided into conciliation districts, at the head of each of which is a conciliation board. It is obligatory to report every actual or threatened cessation of work to this board. Fines ranging from 5 crowns (\$1.34) up to 25,000 crowns (\$6700) may be assessed against an employer or workman who takes part in or assists in an unlawful labor dispute.

SWITZERLAND. The new Swiss Factory Act provided for permanent cantonal conciliation boards. These boards may intervene in a dispute either on their own initiative, or at the request either of the parties concerned or of the local authorities. The boards have the right to compel the attendance of witnesses and to conduct investigations under oath. These conciliation boards are established for settling disputes only in private industries, while a special permanent committee, entitled "the Government Workshops Committee," is appointed to inquire into the claims of labor in government workshops and departments. The functions of this body are purely advisory, the power of action lying wholly with the Federal Council. The Government Workshops Committee has no authority in connection with the Federal railroad system. The conciliation boards and the government committee both contain representatives of employers and of employees.

GREAT BRITAIN. The Australian system of arbitration was suggested for Great Britain during the war period. A conference was held about the middle of 1915 between the representatives of the government and labor, 35 workmen's organizations being represented. It was agreed that there will be no stoppage of work on munitions or equipments of war. Differences on wages and conditions of employment shall be subject to conference between parties. In the case of failure to reach settlement there are three possible means of dealing with the situation: 1. Reference to the Committee on Production; 2. reference to a single arbitrator agreed upon by both parties or appointed by the board of trade; and 3. reference to a court of arbitration upon which labor is represented equally with employers. A threatened strike at the Vickers Naval Construction Works was settled by arbitration; a dispute involving 12,000 men engaged in admiralty work at Southampton was compromised.

After a conference between the executive council of the miners and the representatives of the government in the strike of the Welsh coal miners, tentative terms were agreed upon, including a new standard rate of wages, payment for overtime, abolition of the maximum wage; these terms to be operative until six months after the close of the war, then to be terminated by the government or miners on three months' notice.

AUSTRALIA. The war caused considerable disturbance in industry in 1914 and it became a problem for the different conciliation boards to meet the demands for increases in wages in the making of new agreements. The question was appealed to the Industrial Arbitration Court. The court declared that government employees must not look for higher wages. As to other workers, increases should not be asked for which will prove detrimental to public interest. Community interests were emphasized as being of the greatest importance in deciding disputes.

ARCHÆOLOGICAL INSTITUTE OF AMERICA. The seventeenth general meeting was held in conjunction with the American Philological Association at Princeton, N. J., on Dec. 28-30, 1915. A joint session with the Society of Biblical Literature and Exegesis was held in Columbia University, New York, on the afternoon of Dec. 28th, and a joint session with the International Congress of Americanists was held in Washington, D. C., on Dec. 31st. The annual meeting of the council of the Institute, and meetings of the managing committees of the American School of Oriental Research in Jerusalem and the School of American Archæology were also held. A special meeting of the Archæological Institute was held in San Francisco, Aug. 2-5, 1915, in connection with the Panama-Pacific Exposition, and in conjunction with the American Association for the Advancement of Science. Sessions were held at the University of California and Leland Stanford University, and an adjourned meeting took place in San Diego, August 11-12, under the auspices of the San Diego Society of the Archæological Institute. Tuesday, August 3rd, was Archæological Institute Day at the Exposition, and President Shipley was presented with a bronze medal in honor of the occasion. Among the papers read were: "The Architecture of the Panama-Pacific

Exposition," by Eugen Neuhaus; "Spanish Colonial Architecture at the Panama-California Exposition," by Carleton M. Winslow; "Aspects of Neolithic Culture of the Santa Barbara Channel Islands, California," by Hector Alliot; "Roman Portrait Sculpture," by F. W. Shipley; "The Relation of Religion to Art in Antiquity and the Middle Ages," by Osvald Siven; "Ghiberti's Gate of Paradise in Florence," by George Bryce; and "Archæology of the Panama-California Exposition," by Edgar L. Hewett. The president of the Institute is F. W. Shipley; secretary, Mitchell Carroll; Willard V. King, treasurer. Besides the School of Oriental Research at Jerusalem, the Institute maintains the American School at Athens and the School of Archæology at Santa Fé, N. Mex. It has about 3500 members.

ARCHÆOLOGY. The great war has had its effect upon the activities of the scholars who in the past busied themselves with archæological investigations. In Turkey, for example, it has been impossible to carry on excavations, not only because of the unsettled state of the country, but also because the need for troops has withdrawn men from the localities where work has been carried on. Mesopotamia, now a field of combat, is no place for excavation, and at Sardis, where the Americans have been engaged for several years, it has been necessary to give up work, both because of the unsettled conditions there and because of the lack of laborers. In France, Germany, and England, no archæological work has been done: and in the past some excavation has always been done there. In Italy, too, there has been no archæological research. See also **PEABODY MUSEUM**.

On the other hand, the war has in a curious way been responsible for at least two discoveries of archæological interest. The first of these was made in the Necropolis of Eleantos in the peninsula of Gallipoli. On May 15th, during the fighting, a shell of large calibre, fired by the Turks, in exploding, blew open an excavation of considerable size behind the Allies' lines and laid bare a remarkably well preserved sarcophagus. Upon enlarging the opening thus made by the shell the Commandant Vermeersch found in addition to the sarcophagus a number of tombs and vases dating from the fourth century B.C. Among the finds were many terra cotta figurines of the Myrin type and of exceptional beauty. Particularly interesting was the discovery of two great jars, or pithoi, 1.60 m., both with an opening .50 cm. broad, which contained two skeletons each. The suggestion made is that these were the tombs of a couple of married people or lovers.

The second discovery referred to was made on the Island of Lemnos, where French troops were stationed. Here at Palaiapolis ("old town") on the northern side of the island and facing toward Samothrace, the soldiers in digging a trench uncovered a statue of Eros two-thirds life size. The head, right arm, the left as far as the elbow, and both legs were missing.

EGYPT. Work in Egypt apparently, in spite of the rumors reaching this country of unrest in that quarter, has been carried on much as before. At Ballabish, near Nag' Hamâdi, in Upper Egypt, the work of the Egyptian Exploration Fund has met with success. The work is being carried on under joint Anglo-American direction, and reports already show that Professor Whittmore has found a number of graves

which have been excavated. These are "pan" graves and they contained a vast quantity of pottery, chiefly of the twenty-sixth dynasty or later. They throw interesting light upon the burial customs of the common people of that period.

Acting on behalf of the Museum of Fine Arts in Boston and Harvard University, Dr. Reisner has just published the results of the work at Gizeh in 1914. One of the results of the work was the identification of the royal cemetery of Chefreu (Khafra), and the proving that the custom of placing magical "reserve heads" of the dead in the tombs dates in this period. Among these heads some especially fine ones were recovered—notably that of a princess and one of Prince Sneferu-senb. Two heads of foreign type led Reisner to argue that Egypt experienced an early infiltration of stock from Syria. This was demonstrated, he believes, by the discovery in the tombs of strange vases of hard reddish clay similar to those found in first dynasty tombs at Abydos. Petrie believed them to be of Ægean origin. Reisner thinks them Syrian. The portrait heads referred to above are of especial interest, not only because of their lifelike quality, but also because there seems to be some reason for believing that they indicate that sometime during the fourth dynasty, 2900–2750 B.C., Egyptian blood experienced negroid contamination. Some of these heads came to light in 1914.

At Harêt, Dr. Breccia cleared out the pylons of the first doorway of the temple of Sebek. On the cornice was found an inscription which stated that the vestibule and the pylon had been dedicated in the 34th year of Ptolemy Euergetes II (B.C. 137) to the deity Pnephērōs (P-nefer-ho, 'the beautiful-faced') or Soknopaios, in honor of Ptolemy and his consort Cleopatra and their children, by one Agathodoros and Isidora his wife, citizens of Alexandria. In place at the entrance which led into a large outer court, were found two crouching lions. Around the sides of this court were numerous doorways opening into various apartments. The walls had been covered with stucco except in certain places, where spaces were left for the insertion of paintings. Of these paintings the only one in a good state of preservation exhibits a procession of Pnephērōs. In it the god appears as a mummified crocodile crowned and borne by priests upon a stretcher, while other priests, some with palms or flowers, participate in the ceremonial. In the same court two sphinxes stood on guard at another doorway, which led into a smaller room. Beside this doorway was found a column bearing an inscription which tells that it was erected by the corporation of water-bird breeders in honor of Ptolemy X and Cleopatra III. A third court, entered through a pylon, had on one side a figure of a warrior in full armor and an inscription saying that the dedication was an act of gratitude on the part of Heron Soubattos. The third court, into which this doorway gave access, opened into the principal chapel of the sanctuary, which contained a large and elaborate altar, and which showed upon its walls the figures of deities. The altar is a very important illustration of the furniture of an Egyptian temple.

The results of the excavations of the Metropolitan Museum at Lisht have just appeared. The work centred about the south pyramid, that is, the pyramid of Sesostri I (twelfth dynasty, about 1950 B.C.). On the northern side of the

pyramid temple two small pyramids were uncovered. One of these had been rifled. The shaft of the other was discovered at the south-west corner of the structure. It was 2 meters square and descended for 15 meters into the rock. At this depth a passage led off seemingly under the centre of the pyramid. This monument also had been rifled. Its chapel lay on the eastern side. As the excavation was carried on beyond the outer enclosure wall of the pyramid of Sesostri, a tomb was found near the causeway. This proved to be the burial place of Imhotep, one of the high officials of the King. It was a mastaba measuring 13 m. by 6 m., and was surrounded by a thick wall of sun-dried brick. In the paved area between the tomb and the wall were located two shaft burials which had been robbed in the past. One of the interesting finds in connection with these shafts was a rope some 11 m. long, which had been hastily braided by the robbers from strips of linen. The shaft of Imhotep's tomb on the northern side of the mastaba, 2.5 m. square, penetrated the bed rock to a depth of 15 m. Then in a southerly direction a passage led for some 5 m. into a burial chamber 4 m. square and 3 m. high. In the floor of this chamber a small sarcophagus chamber had been hewn in the solid rock and covered over with heavy blocks of limestone level with the floor. The tomb had been sacked.

One of the most interesting discoveries in connection with this tomb proved to be a chamber, about 65 cm. square, concealed in the thickness of the enclosure wall of the mastaba. It was roofed with planks and these covered with sun-dried brick. The interior of this small chamber was lined with pinkish plaster. The noteworthy part of the find was not the chamber, but two small royal figures carved out of cedar and identical, except that one wore the red and one the white crown. That with the white crown stood 56 cm. tall; that with the red crown, 58 cm. Traces of pinkish color remained on the nude portions of the figures, while the skirts and crowns were covered with stucco, the better to furnish a body for the color. Along with these two figures was found a small wooden shrine painted yellow, 58.7 cm. high by 31.5 cm. broad, and 22.5 cm. deep. It was closed by a bolt shot through copper staples in the double doors. Within it was an alabaster vase half full of a bluish ointment which had solidified. In this ointment stood a curious object which proved to be a cedar rod about 53 cm. long and 1.5 cm. thick at the point where it entered the ointment. This rod was carefully bound with linen wrappings which enclosed as well a "dummy" animal made up of skin and padding. It is believed to be the Anubis symbol; this and the other objects in the chamber are unique.

Work carried on eastward of Imhotep's tomb brought to light many tomb shafts. Among these, one particularly is interesting. It had never been disturbed and was a tomb of three chambers, all opening out of the same shaft at a depth of 6 m. In the northern chamber was found two wooden coffins, in one of which was the owner of the tomb with his walking stick beside him, and a little figure of the man himself. The eastern chamber contained but one burial, but the other, on the southern side of the shaft, was so packed with burials that the chamber was filled to the roof. Two coffins had

been even shoved in on their sides so as to be able to get them in.

To the south of the tomb of Imhotep the excavators found a series of house walls which seem to have been those of the houses of guardians and priests of the precinct of the temple.

At Memphis the Eckley B. Coxe, Jr., expedition has unearthed a temple which the excavators believe to belong to the period of Rameses II. The belief is held that it was erected by Seti I, and that it is the particular building described by Herodotus.

The expedition of the Metropolitan Museum of Art at work at Thebes has devoted particular attention to clearing the tomb of Surer, the scribe and fan-bearer of Amenhotep III, the heretic king. The tomb, quite elaborate in its organization, consists of these features, all hewn from the rock. After passing through a courtyard one enters a transverse hall, the ceiling of which is supported by 20 fluted shafts of the proto-Doric type. This part had been cleared two years ago. From this transverse hall one then passed into an inner hall, the axis of which was at right angles to the preceding, 74 feet long, and divided into three aisles by 20 lotus-bud columns. In this hall was found a papyrus manuscript containing an account of a suit between two women over a slave girl. Proceeding still further inward one enters another hall, somewhat rougher in execution than the others, containing four rows of 20 lotus-bud columns of that ungraceful type in which the bud is inverted. Finally, behind this last room one comes to a pillared hall, excavated only to one-half its height, with three aisles of six piers.

An interesting feature in connection with this tomb is the fact that the name of Surer, the owner, had been scrupulously eliminated wherever it appeared in the inscriptions. Even the figure of the hapless man had been obliterated from a relief in which he was represented holding the fan for his royal master. The apparent reason for this is that Surer did not sympathize with Amenhotep, or Akhnaton, in his attempt to substitute the worship of the one god, the sun, for that of all others.

In the courtyard of the tomb were found several later burials, all of which had been pillaged. In one coffin the body of a woman had been crowded in on top of that of a man.

The same expedition also partially cleared the tomb of Puimre, also at Thebes. The tomb was located high on the face of a cliff. A close examination of the tomb showed that shafts and chambers ran in every direction, over, under, and even into each other. At one place, which was reached by a flight of stairs about 80 feet long, the chambers were three stories deep. In two large rooms the debris, made by earlier plunderers who had torn the bodies limb from limb, was knee deep. The tomb chamber of Puimre himself was at length discovered at a point deep in the rock and reached by a deep shaft that made down from the court, then by a sloping passage, two stairways, and finally through two intermediary chambers. The burial chamber itself was small, cut in the rock, and lined with slabs of sandstone to make it into a great sarcophagus. Even this had been robbed.

At Thebes, also, the same excavators cleared out the tombs of Userhêt and Thotemhab. During the clearing of the tomb of Nakht, the kneeling statue of Nakht, about 40 cm. high, was

found in the filling of the pit where it had fallen from a niche at the top. This statue was lost when the steamship *Arabic* was sunk.

GREECE. As might be expected, little has been done in the way of excavating in Greece. However, by making use of boys and old men, since the adult population for the most part is under arms, the American school in Athens has been able to carry on its work at Corinth. The excavations proved to be a godsend to the natives, owing to the lack of employment brought on by the war. The most notable finds made in clearing the Roman part of ancient Corinth consist in a draped statue of Augustus and of two youthful figures which are thought possibly to represent his grandsons. Experimental diggings in the neighborhood of Corinth have brought to light Mycenaean remains in six places. These remains consist of late pottery. As yet no great necropolis has been located. Some ruined walls of this Mycenaean period were also found. At Palaio-kastro, in Cephalenia, excavations have brought to light indications of a cemetery of the Mycenaean Age.

In Crete, the Greeks have opened the Tholass tomb at Platanos, in the Messara, in Southern Crete. Here were discovered two bronze votive double axes, diadems, necklaces, rings, and other gold objects, besides 70 bronze daggers (10 being of the primitive triangular form), 10 ivory and stone seals, and 370 variegated stone vases similar to those found by Seager at Mochlos some years ago. Among the particularly interesting discoveries were a small stone idol resembling those of the pre-dynastic period in Egypt, and an ivory seal showing two apes. This is the first appearance of such a device upon a Minoan seal. From these the early relation of Crete and Egypt is thus established and they explain the similarity noted between certain early Cretan stone figures and those of wood or ivory that have been recovered from early pre-dynastic cemeteries in Egypt.

ARCHIBALD, F. J. See U. S. AND THE WAR. **ARCHITECTURAL LEAGUE EXHIBITION.** See PAINTING AND SCULPTURE.

ARCHITECTURE. Everywhere but in the United States, and sporadically in other neutral countries, the toll of war was laid heavily upon architectural progress during 1915. European effort was practically at a standstill in all the belligerent countries except England and Germany. In the former, due to the availability of men in the absence of any system of universal military service, a certain amount of building activity was apparent, although no great project of permanent value had been undertaken; and toward the end of the year even this little activity began to ebb out. In Germany, by a seeming trick of circumstances, the output was very nearly normal in all but monumental structures, and large public buildings and dwellings, but there were numerous competitions under way for schools, churches, city halls, and hospitals, not to mention various civic extensions—totaling in the case of Berlin alone no less than \$75,000,000 for improvements to be undertaken at once. France, Italy, and the other nations at war produced nothing; in these countries even the periodicals in most cases suspended, or devoted their pages to historic buildings, restorations, and the like, as had been done for some time in the publications of the other nations as well. In the United States the year's contribu-

tion was not highly commendable, though very nearly normal in quantity. Many buildings, even under the conditions of reduced output, must perforce be omitted in the succeeding paragraphs, but an attempt is made to strike a reasonable balance between quality and quantity in each country considered, a concise résumé rather than an accurate compilation. Since great reliance must be placed upon weekly and monthly publications in the preparation of such material, a goodly number of completed structures which are properly to be dated within the year 1915 cannot be included and must remain inedited until the succeeding issue of the YEAR BOOK.

UNITED STATES

American financial supremacy, as determined by American agricultural and industrial advancement, bade fair in a short time to close the hiatus of architectural inactivity that had characterized the years 1914 and 1915. There was current a persistent general feeling that the United States had weathered successfully the unsteady first effects of the gathering world storm that had all but snuffed out architectural growth in Europe. A noteworthy parallel was the increase in public confidence which invariably results in improved building conditions. That improvement had not been substantiated by any unprecedented number of new buildings; in fact, by way of discouraging example, the low tide conditions in New York City alone are well indicated by a single, though fortunately not representative, week in October, when but one set of plans for a new building had been filed for inspection. When it is recalled that New York's buildings cost over \$33,000,000 less in 1914 than in 1913, the report would lead us to expect but little of the year under review. On the other hand, San Francisco and Chicago were busy. The latter outstripped New York by about \$9,000,000 in the cost of its new buildings during 1914, and to the credit of San Francisco was placed the greatest increase in the country for the same period, over \$7,000,000. These amounts must be modified somewhat for 1915.

A survey of the field shows practically the usual quota of residences, perhaps slightly reduced in number for the first half of the year, when war profits had not been so definitely established. Of smaller private dwellings, whose owners would be most readily affected by money conditions, there were very few. The same may be said of theatres—with the exception of those devoted to films—monuments, and public buildings. On the other hand, there were erected a fair number of hospitals, schools, churches, clubs, and, to a certain extent, of office buildings; the output of apartment houses was practically normal.

Fortunately the decreased output has not resulted in any serious qualitative deterioration. American effort toward a proper expression of American needs must ultimately result in an American architectural language; each year contributes its quantum of study and interpretation, not to say of imitation of accepted older forms; but the insistent problems of our daily life demand an architectural outlet that older manners cannot offer, and American ability is ample and able to devise such an outlet, both practically and stylistically. Even a poor building year, such as 1915, bears nevertheless the

indication of the slow but well-defined trend toward the goal of style and utilitarian perfection, manifested by conservative advance in the East, by bold experimentalism in the West, by solutions many and varied in the greater municipal centres.

EXPOSITIONS. The whole field of architecture in the United States was dominated by the fabulous groups of the Panama-Pacific International and the Panama-California Expositions at San Francisco and San Diego, respectively. These demonstrated the true province of expositions as factors in life; not only to enhance industrial possibilities, nor only to acclaim a memorable achievement of international scope and value, but also to offer a thorough index of national strength, ability, and resource in architectural planning and design, a record by the nation's best architects and a school of examples for many years to follow.

Panama-Pacific International Exposition. To the municipal courage of San Francisco in living down the trials incidental to the earthquake and fire of 1906, but five years before the inception of its international project, the splendid Panama-Pacific buildings may be considered a fitting monument. The undertaking was financed to the extent of \$17,000,000 solely by residents of California, without the usual Federal subsidy. The architectural control devolved upon a commission of nine practitioners from different parts of the country. After much preliminary consultation with various government offices and many experts in construction, gardening, and the like, and after numerous conferences among themselves, the commission unanimously adopted the court plan, to be carried out on a site fronting the bay, near the Presidio Military Reservation, and overlooking the Golden Gate.

The work of grading and filling ground preparatory to the actual erection of units was one of the most extensive projects of the kind ever undertaken, for no less than 80 per cent of the whole site was involved. Of similar importance were the matters of piling and foundations, sewers and drains, tracks and roadways, ferry slips and piers, basins, lighting, planting. Full gauge railroad tracks during the period of construction ran into each palace; in fact, a tunnel was built under Fort Mason to facilitate connections with main railway lines. Separate ferry slips with regular service were likewise built, definite connection with transcontinental trains established, and a protected bay inlet provided for smaller boat traffic along the shores.

The plan was conceived on the basis of a single central circulation area or highly emphasized major axis, as was the case in previous expositions. The so-called court plan, however, which was adopted in the present instance, developed the whole project as a series of courtyards as the nuclei of design motives, rather than as a series of axially located buildings. Minor axes cut across the major artery at right angles and at each intersection a new court motive appears. As a result the various buildings took the keynote in design from the schemes adopted for the courtyards upon which they face. That is to say, as units in design, there were no buildings at all, but simply a series of coördinated courtyards. Thus, for instance, the Palace of Varied Industries was an agglomeration of five façades, determining the design of the

Court of Abundance, the Court of Flowers, the Avenue of Palms, the Avenue of Progress, and the Court of Mines. To understand the point of view properly, then, it is essential to conceive of courts and avenues only, and not of buildings, for the latter changed front chameleon-like in accordance with the surrounding open areas; thus each building in the main block, at least, was subject to four or five influences in design. While no general scheme of design in a definite sense controlled the whole exposition, the courts themselves were marvels of imagination and manipulation of ornamental forms; great ability likewise appeared in the mural paintings and sculptural units. The styles illustrated varied from a Spanish Renaissance-Gothic combination to Italian and French Renaissance, and from suggested Roman Classic to entirely novel conceptions, such as that of the remarkable Tower of Jewels, facing the southern gardens. In color scheme this exposition far outstripped its predecessors; a fine travertine texture and color prevailed, softening all high lights and eliminating glare. The night illumination was a wonder of ingenuity and colored light, both direct and indirect, reflected and diffused; most actual light sources were concealed, electric scintillators coming largely into requisition.

Panama-California Exposition. The splendid monumental quality of the San Francisco groups was not present at San Diego; it was, indeed, studiously avoided. Instead, there was at once apparent a picturesqueness and irregularity that found an immediate appeal. The treatment throughout indicated a more homelike quality concomitant with its more individual purpose of exploiting a single State; it had not an international purpose. The color scheme was a simple white without glare; the architectural style was uniformly Spanish-Colonial, involving the use of finely wrought detail relieved against plain wall areas. The plan maintained a principal east and west axis, and to a certain extent two minor axes. The former of these was El Prado, a broad roadway continuing the line of the Puente Cabrillo, an exceptionally attractive engineering feature bridging the deep canyon of a small brook, with a highroad and lake, all named after Cabrillo, the founder of the city of San Diego. The arrangement of buildings and squares was dependent upon the axes, but at the same time suggested a random feeling which was one of the exposition's greatest charms. Thus the great Plaza de Panama ran north and south, was of longish oblong plan, and made a right angle with the Prado, instead of forming in symmetrical fashion a regular widening of the main avenue; in the same manner the Plaza in turn narrowed into an Esplanade terminated by a hemicycle motive centring about a giant open-air organ. In both expositions the amusement concessions, as well as the areas devoted to cattle exhibits and athletic contests, were not accorded with the main scheme of design; but on the other hand, all concessions, as well as the spaces assigned to State Buildings at San Francisco or to County Buildings at San Diego, were carefully treated with reference to their own planning needs. At San Diego, especially, the natural features were of great advantage, the climate of Southern California being in fact a bona fide assistant in the work of construction. Judging the whole conception properly as a State exposition, the San Diego groups

must be considered an unqualified success. See also AGRICULTURAL EDUCATION; and BUILDING OPERATIONS.

CHURCHES. Ecclesiastic architecture during 1914 is not of certain trend; the decided domination of the Gothic of Cram and Ferguson, as well as that of B. G. Goodhue, is not much in evidence, although the mediæval styles are still in great favor. The Colonial manner is represented by one or two examples and the Italian Renaissance is well exemplified in two others. In general, however, the church building of the year is of modest proportions both in the number and quality of buildings. Several good plan solutions are noteworthy, as, for instance, those of Trinity Lutheran Church at Akron, Ohio, by J. W. C. Corbusier, and Christ Church, Los Altos, Cal., by Coxhead & Coxhead. Brick is finding always greater favor for the smaller church buildings, due in part to the more frequent use of the north Italian styles, both in Romanesque and in Renaissance. Good brick examples are Carrollton M. E. Church, New Orleans, La., by Sam Stone, Jr.; First Church of Christ Scientist, Los Angeles, Cal., by Elmer Grey; the Ravenswood Presbyterian Church at Chicago, by Pond & Pond; and the church and rectory of St. George, New York, by Robert J. Reiley. Among the best designed examples may be mentioned the quiet and attractive Chapel of Divine Love, Philadelphia, by Paul Monaghan; the Italian Romanesque St. Patrick's Church in the same city, by Lafarge & Morris; the House of Hope Presbyterian Church, St. Paul, Minn., by Cram & Ferguson; the Italian Renaissance Church of St. Vincent Ferrer, New York, by Bertram G. Goodhue; and the chapel of the Dominican Sisters of St. Agnes, Sparkill, N. Y., by Davis, McGrath & Kiessling. Other examples are: St. Mark's, Dorchester, Mass., by Brigham, Coveney & Bisbee; St. Henry's, Bayonne, N. J., by T. H. Poole & Company; First Congregational Church, San Francisco, by Reid Brothers; Emanuel Church of the Evangelical Association, in the same city, by Falch & Knoll; St. James's Presbyterian Church, New York, by Ludlow & Peabody; First Presbyterian Church at San Diego, Cal., by Robert H. Orr; First Presbyterian Church at Spokane, Wash., by L. B. Valk; First Church of Christ Scientist, Worcester, Mass., by O. C. S. Zirolì; St. Luke's, Evanston, Ill., by Lowe & Bollenbacher; First Church of Christ Scientist, Seattle, Wash., by Charles H. Bebb & L. L. Mendel; All Saints Episcopal Church, Newbury, Mass., by Clark & Russell; Plymouth Congregational, at Chicago, by Riddle & Riddle; St. Rita's, Philadelphia, by George I. Lovatt; St. Elizabeth's, Philadelphia, by Bailly & Bassett; the temple of B'Nai Jeshurun, at Newark, by Albert S. Gootlieb, is the only noteworthy synagogue erected during the year.

SCHOOLS. While the output of school buildings is not characterized by a memorable increase numerically, it is notable for the high quality of planning skill everywhere in evidence. At Coronado, Cal., Quayle Brothers & Cressey produced a particularly good result. The same may be said of Francis W. Parker School at San Diego, by Templeton Johnson. This is named after the well-known philanthropist whose benefactions in Chicago and generally in Cook County, Ill., have largely taken the form of school improvements. The school in question is

THE PALACE OF HORTICULTURE

FESTIVAL HALL—APPROACH FROM SOUTH GARDENS

PANAMA-PACIFIC INTERNATIONAL EXPOSITION, SAN FRANCISCO

of the southwestern patio plan, one story high, all rooms facing and actually open toward the courtyard; the result is practically that of an open air group of class rooms. Another notable example in this field is that accomplished by E. F. Guilbert in the McKinley School at Newark, N. J. This is designed in stucco with decorative motives in tapestry brick and colored tile, following in general the manner of the Italian Renaissance. The building constitutes more of a cheerful neighborhood centre, than simply a school of text-book instruction. Several of the rooms are of the open air type and a large play court is provided at street level. The solution of the problem involved, in view of the irregularity of the site, is without question very creditable. Brick is still largely favored in the East and Middle West, while stucco naturally predominates in the Far West. Good brick examples of notable design are: the Trenton School of Industrial Arts, by Cass Gilbert, in which tapestry brick and tile appear; the Regis High School, New York, by Maginnis & Walsh, a monumental Italian Renaissance building; the brick and half-timber Donners Grove Kindergarten at Donners Grove, Ill., by Perkins, Fellows & Hamilton, undoubtedly one of the best designed examples in several years; the collegiate Gothic St. Ignatius's Loyola Day Nursery, New York, by W. Weissenberger, Jr.; the South Side High School, Newark, N. J., by E. F. Guilbert; the Fresno Normal School, Fresno, Cal., by the Architectural Division of the California State Department of Engineering; the grouped scheme of three buildings in the Edward Devotion School, Brookline, Mass., by Kilham & Hopkins; the Crookston High School, Crookston, Minn., by Bert D. Keck; the Dickerman School, Boston, Mass., by J. R. Schweinfurth; the dining hall of the Hill School, Pottstown, Pa., by Hewitt & Bottomley. Other examples are: the Walker School, Concord, N. H., by H. Templeton Blanchard; the Addison School, Cleveland, Ohio, by F. S. Barnum & W. R. McCormack; a parochial school at Holyoke, Mass., by John William Donohue; the South Park High School, Buffalo, N. Y., by Green & Wicks; the Norwood High School, Norwood, Ohio, by Ban-smith & Drainée; a public school building at Riverton, N. J., by Heacock & Hokanson; the High School of Commerce, Springfield, Mass., by Kirkham & Parlett; and the Hebrew Institute, Chicago, by Ottenheimer, Stern & Reichert, a structure entirely of concrete, the design suggesting certain German work, and achieving a decidedly interesting result.

UNIVERSITIES. The year does not offer any remarkable examples of planning, such as the various general group schemes adopted during 1914 among the important universities of the country. Times of financial stress are apt, among their first effects, to reduce benefactions to institutions, and when the slow work of restoration of equilibrium gathers strength it shows its effects in turn upon the dwellings and business buildings and only secondarily in institutional structures. A few notable single buildings are to be put down to the credit of 1915, however, such as the Evans Museum and Dental Institute at the University of Pennsylvania, Philadelphia, by John T. Windrim; Prudence Risley Hall, in the collegiate Gothic manner, by Miller & Mallory, at Cornell University, Ithaca; the excellent Gothic work of Allen &

Collens in Taylor Hall, at Vassar College, Poughkeepsie, N. Y.; Gilman Hall and other buildings on the new site of Johns Hopkins University, by Parker, Thomas & Rice, and by Joseph Evans & Sperry; Green Hall Auditorium, at Smith College, Northampton, Mass., by Charles A. Rich; an art building for Oberlin College, by Cass Gilbert; a men's gymnasium for Dartmouth College, Hanover, N. H., by Charles A. Rich, and a similar building at Leland Stanford Junior University, Palo Alto, Cal., by Bakewell & Brown; an infirmary for Haverford College, at Haverford, Pa., by Baily & Bassett; and a large concrete stadium for the College of the City of New York, by A. W. Brunner. With these should also be included the Nelson Morris Memorial Institute for Medical Research, Chicago, by Richard E. Schmidt, Garden & Martin.

HOSPITALS. In the field of hospital construction it is interesting to note that the last five years witnessed the greatest contribution in the way of bequests and direct donations that has ever accrued to any single type of building. The six most important examples, of which four are also teaching hospitals, are the following: that at the University of California, Berkeley, Cal., \$615,000; the Isaac L. Rice Hospital, New York (not yet begun), \$1,000,000; the New Haven Hospital, used by the Yale Medical School, New Haven, Conn., \$1,500,000; the Burke Convalescent Hospital, White Plains, N. Y., \$5,000,000; the Peter Bent Brigham Hospital, connected with Harvard University, Boston, Mass., \$7,000,000; and the large project to be undertaken by the Presbyterian Hospital of New York and Columbia University upon a new site in upper Manhattan, \$8,500,000. In this connection the following well planned buildings and groups should also be noted: the Cincinnati General Hospital, by Samuel Hannaford & Sons; the Jewish Maternity Hospital, Philadelphia, by Hewitt, Granger & Paish; the Abington Memorial Hospital, Abington, Pa., by Bissell, Sinkler & Tilden; the Central Dispensary and Emergency Hospital, Washington, D. C., by Nathan C. Wyeth; the Highland Private Hospital, Fall River, Mass., by Parker M. Hooper.

PUBLIC BUILDINGS. Among the Federal structures erected during the year, the most important were the Post Office and Court House at Denver, Colo., by Tracy, Swartwout & Litchfield; the United States Treasury Building, San Francisco, by J. Milton Dyer; the Post Office, Washington, by Graham, Burnham & Company; the Post Office, New Orleans, La., by James Gamble Rogers; the fine arcaded Florentine design of the Post Office at Berkeley, Cal., by William Arthur Newman & Oscar Wenderoth; and the additions to the Custom House at Boston, by Peabody & Stearns. In the last named the old building was made a base for a tall office tower, erected over an earlier dome. The fine Senate and House of Representatives Office Buildings were also occupied during the year, and the Department of Agriculture completed the Bieber Building from designs by MacNeil & MacNeil. All of these edifices are in the Capital city. Among the other public buildings, municipal and others, erected during the year are to be mentioned: the Hamilton County Court House, Cincinnati, Ohio., a \$2,500,000 structure by Parker, Kellogg & Crane; the armory of the Eighth Coast Artillery, New York, by

Pilcher & Tachau; a fine Municipal Building for Waterbury, Conn., by Cass Gilbert; a City Hall for Burlingame, Cal., by Chas. P. Weeks; the Town Hall of Bourne, Mass., by James Purdon; the remodeling of the Delaware County Court House, Media, Pa., by Brozer & Robb; an annex to the Boston City Hall, by E. T. P. Graham. Two well conceived bath houses should be included in this list: the Fordyce Bath House, Hot Springs, Ark., by George R. Mann & Eugene J. Stern, and the South Side Bath House, Pittsburgh, Pa., by MacClure & Spahr. One of the very good buildings of the year is undoubtedly the great Auditorium which forms the permanent building left as a monumental record of the Panama-Pacific International Exposition. This edifice will seat 12,000 persons, and was erected at a cost of \$1,000,000. It is located in San Francisco's new Civic Centre, some distance from the Exposition Grounds.

LIBRARIES. The year's best library buildings were that erected in Denver, Colo., by Ackerman & Rose and the Widener Memorial Library, by Horace Trumbauer, at Harvard University, Cambridge, Mass. The latter is one of the notable buildings of 1915 and has at once taken its place among the foremost library buildings of the country. At Bar Harbor, Me., the Morris K. Jesup Memorial Library was built from designs by Delano & Aldrich; Beverly, Mass., built a public library building from designs by Cass Gilbert; while D. Knickerbacker Boyd designed the Southwark Branch of the Philadelphia Public Library. Other examples of note are the Harrisburg, Pa., Public Library, by E. S. Child, and the Warren Library, Chicago, by Wm. E. & Arthur A. Fisher.

BANKS. The policy of locating banking firms in large office buildings continues in favor; in this field 1915 exceeds 1914 by about 30 per cent in the number of buildings erected. Cases in point are the Boatmen's Bank at St. Louis, Mo., by Eames & Young; the Citizen's National Bank, Los Angeles, Cal., by John Parkinson & Edwin Bergstrom; the First National Bank of Pueblo, Col., by R. E. Schmidt, Garden & Martin; the Murchison National Bank, Wilmington, N. C., by K. M. Murchison; the Holston National Bank, Knoxville, Tenn., by John Kevan Peebles; the Hartford National Bank, Hartford, Conn., by Donn Barber; the Brooklyn Trust Company, New York, by York & Sawyer. Smaller banking buildings of the year were the Corn Exchange Bank's Bronx and Eighty-sixth Street Branches, New York, by H. T. Lindeberg; the Stockton, Cal., Savings Bank, by Charles W. Dickey; the Far Rockaway National Bank, New York, by Jos. L. Steinam; the Amsterdam Savings Bank, Amsterdam, N. Y., by M. T. Reynolds; the First National Bank, Champaign, Ill., by Mundie & Jensen; the First National Bank, Allegheny, Pa., by F. J. Osterling.

HOTELS. The great era of hotel building of the year 1914 has been succeeded by a decided falling off in the number of new hotels, although no reduction is noticeable in the sumptuousness of the larger examples contributed by 1915. The finest of the year was the William Penn Hotel, Pittsburgh, Pa., by Janssen & Abbott, a 20-story structure containing 900 rooms; the enormous Hotel Traymore at Atlantic City, N. J., by Price & McLanahan; the well-designed Hotel Muhlbach, Kansas City, Mo., by Holabird & Roche; the Hotel Morrison, Chicago, by Mar-

shall & Fox, with 1600 bedrooms; the attractive Hotel Pantlind, Grand Rapids, Mich., by Warren & Wetmore; the brick and terra cotta Adelphia Hotel, Philadelphia, by Horace Trumbauer. Other less important examples were: the Hotel Allerton, New York, by Paul C. Hunter; the Capitol Park Hotel, Washington, D. C., by A. B. Mullett & Co., the Gothic Hotel Fontenelle at Omaha, Neb., by Thomas R. Kimball; the Hotel Black Hawk at Davenport, Ia., by Temple & Burrows, and the Hotel Brunswick at Lancaster, Pa., by C. Emlen Unbau, involving the use of a hot-water heating system in an eight-story building.

STORES. No important work was accomplished in this field during the year just closed. The largest buildings of the type to be erected were probably the May Store, Cleveland, by Graham, Burnham & Company, and the Ames Store in the same city, by Starrett & VanVleck. The severe Arnold Constable Store, New York, by T. J. Bartley, should also be mentioned. What may be the beginning of a new departure in New York City architecture is seen in the Standard Arcade, by Severance & VanAlen. Two very good public markets may be properly classed here, the Astor Public Market, New York, by Tracy & Swartwout, and the Worcester, Mass., Public Market, by O. C. S. Zirolli, both of well studied design.

OFFICE BUILDINGS. The largest office building of 1915 was the Equitable Building, New York, by E. R. Graham. This is the largest structure of its kind in existence, covering 48,000 square feet of ground, measuring 545 feet in height, rising to 45 stories above the street, and requiring foundations 85 feet in depth. Other large examples are: the Merritt Building, Los Angeles, Cal., by Reid Brothers; the terra cotta Goelet Building, New York, by Warren & Wetmore; the Hasco Building, New York, by Walter Haefeli; the Victoria Building, New York, by Schwartz & Gross; the Federal Realty Building, Oakland, Cal., a devious Gilbert inspiration, by B. G. McDougall; the Gothic building of the Delaware and Hudson Company, Albany, N. Y., by Marcus T. Reynolds; the Hurt Building, Atlanta, Ga., by J. E. R. Carpenter; the Balboa Building, San Francisco, Cal., by Bliss & Faville. The Russell Sage Building, New York, by Grosvenor Atterbury is the most attractive single example from the standpoint of design. The only newspaper buildings erected during the year were the *Farm Journal* Building, Philadelphia, by Bunting & Slougle; the *News Press* Building, St. Joseph, Mo., by Eckel & Aldrich; and the Circle Building, New York, by J. C. Greene. The last named is to be the home of the Hearst papers in New York. Only two stories have been completed to date; a huge tower will ultimately surmount the long low main body of the building. Other good examples of office buildings, without the skyscraper element, are: the Parkway Exchange of the Bell Telephone Company, Philadelphia, by John T. Windrim; the Widener Building, Philadelphia, by Horace Trumbauer; the Hallenbeck-Hungerford Building, New York, by William E. Austin.

FACTORIES, WAREHOUSES. Owing usually to their lack of architectural merit, factories and warehouses are rarely heralded in the architectural press; the same holds true to a great extent of the loft building type of factory, which resembles the office building in construction and

often is of similar design. A few of the more interesting examples contributed by the year may be mentioned, however: namely the bakery of Montgomery, Ward & Company at Kansas City, Mo., by J. W. McKecknie; the building of the Frank P. Lewis Cigar Company, at Peoria, Ill., by Hewitt & Emerson; the Kuppenheimer clothing factory, by S. N. Crowen, and the Burke & James factory, by Hill & Woltersdorff, both in Chicago; and the Thompson Malted Food Company Building, Waukesha, Wis., by Henry C. Hengels. Of the warehouses we may mention the Larkin Warehouse at Philadelphia, by Ballinger & Perrot, and the Wenter & Drechsler Warehouse at Oak Park, Ill., by Geo. S. Kingsley. In this connection is also to be noted the \$5,000,000 factory terminal begun by the Hoboken Land and Improvement Company at Hoboken, N. J., comprising six 12-story manufacturing lofts.

CLUBS, ETC. Among the year's club and society buildings the largest single group is again that of the secret orders. Thus we find new Elks' Club homes erected in Mankato, Minn. from designs by Bell, Tyrie & Chapman; at Pasadena, Cal., by Myron Hunt; and at Brooklyn, N. Y., by H. VanBuren Magonigle & A. W. Ross, the last named a fine building in the style of the Italian Gothic to Renaissance transition. An Odd Fellows' Hall was built at Oakland, Cal., by J. Henry Boehrer, another Masonic Building at Camden, N. J., by Heacock & Hokanson. The only pretentious athletic club of the year was the new building of the Detroit Athletic Club, a well designed and well appointed building, by Albert Kahn & Ernest Willy. The only Christian Association building was the Y. W. C. A. branch at Newark, N. J., by George B. Post & Sons. Among the social clubs are to be noted: the Suburban Club at Stamford, Conn., a Georgian brick structure, by Frederick B. Stearns & George F. Shepard; the Golf Club House at Dedham, Mass., by Melville Seth-Ward; the Knickerbocker Country Club, Tenafly, N. J., by Aymar Embury II. Various collegiate club buildings were also erected as follows: the Harvard Club addition, New York, by McKim, Mead & White; the Phi Gamma Delta Fraternity House, Philadelphia, Pa., by Mellor & Meigs; the "Michigan Union" Building, Ann Arbor, Mich., a very successful modernized Gothic design, by Pond & Pond; and the University Club, San Francisco, Cal., a good brick design modeled after the suggestions of the Italian Renaissance palace, by Bliss & Faville. Buildings were likewise erected by the following organizations of various purposes: the Musicians' Mutual Relief Society Building, Boston, Mass., by Maher & Winchester; the City Club, Boston, Mass., by Newhall & Blevins; the T Square Club, Philadelphia, by Wilson Eyre & McIlvaine; the Three Arts Club, Chicago, an original brick design, by Holabird & Roche; the Church Club House, St. Paul, Minn., by Frederick H. Brooke; and the stately Congressional Club, at the National Capital, by G. O. Totten.

APARTMENTS. It is of little avail to chronicle a large number of apartment house designs, for these offer but little of interest in the majority of cases. Certain stereotyped solutions appear again and again, and architects seem not yet to have mastered fully the general problem of this type of building. Much may be expected in this field, however, in the near future, for the

larger city populations are becoming more and more accustomed to the inconveniences of "living in layers," and the numerous space-saving devices and time-savers invented by eager exponents of present-day rush, not to mention the reduction in running expenses and responsibility offered by the apartment house, have rendered this mode of life increasingly attractive. Little of this kind of material finds its way into the periodicals, owing to the small scale at which illustrations must be shown to give the full height of the buildings, and owing also to the general paucity of good designs. We might record, among others, the Craig Apartments, Chicago, by Richard E. Schmidt, Garden & Martin; the Brown Apartments, Portland, Ore., by Clausen & Claussen; a number of examples in Chicago and New York, by Rouse & Goldstone, Cross & Cross, Louis Bouchard, and others. The rapidly growing districts of apartment houses in the West End Avenue and Park Avenue sections of New York offer a fairly close index of progress in this field. In this connection should also be mentioned the increasing number of model tenements, such as those recently erected in Avenue A, New York, providing sanitary, safe, and attractive small homes at a minimum rental. Thus a recent example offers in one building 60 two-room suites, 118 three-room suites, and 12 four-room suites, a total of 190 apartments, with a maximum rental of \$1.80 per room per week, leases being made by the week. Record must also be made of the fine solution by Schenck & Mead, of the housing problem involved in the clearing of Washington's alleys; a piece of work made possible by the Alleys Bill passed after the death of Mrs. Wilson. This project has been called the Ellen Wilson Memorial Homes, and was fostered by the District of Columbia Section of the Women's Department of the National Civic Federation. The homes will comprise 130 houses, offering accommodations for 250 families or 1000 persons.

RESIDENCES. The rapid progress of domestic architecture has been seriously hampered by money stringency resulting from European conditions, chiefly because funds have been diverted temporarily to more directly lucrative channels. War conditions have likewise imposed added difficulties upon the small house builder, and for some months the residential work is restricted to larger dwellings. As the year draws to a close profits from the manufacture of munitions and from allied sources have become available and a gradually increasing number of domestic buildings is reported, only to be hindered again by the high cost of building materials due to the causes indicated above. Among the dwellings erected in the Eastern States the following deserve mention: in Massachusetts, the Rantoul Residence at Ipswich, by Andrews, Jaques & Rantoul; the Rogers Residence at Newton Centre, by Oscar A. Thayer; in Connecticut, the Marble Residence at Greenwich, by Rowe & Smith; the VanShaack Residence, by A. Raymond Ellis; and the Allen Residence, by E. T. Hapgood, both at Hartford; the Leigh Residence at Bridgeport, by Ernest G. Southey; the Houghtaling Residence at Sharon, by Mann & MacNeille; in Rhode Island, the Duncan Residence at Newport, probably the most pretentious mansion of the year, by John Russell Pope; in New Jersey, the Hughes Residence at Plainfield, by Wilder & White; the Miller Residence, Newark, by Jordan Green; the Fowler

Residence at Peapack, by Hewitt & Bottomley; in New York, a city house on Manhattan, by W. W. Bosworth; the Phillips Residence at Tuckahoe, by John H. Phillips, an Italian villa adaptation; the important Lewisohn Residence at Ardsley, by Coulter & Westhoff; the Winthrop Residence, Syosset, L. I., by Delano & Aldrich; the Weld Residence, Huntington, L. I., by C. A. Platt; the Billings Residence at Locust Valley, L. I., by Guy Lowell; the Delano Residence at Syosset, L. I., by Delano & Aldrich; the Von Stade Residence at Westbury, L. I., by Cross & Cross. The best work of the year in Pennsylvania includes the following, many of which show the old Dutch Colonial tradition fittingly adapted to modern needs: the Saunders Residence at Germantown, by Duhring, Okie & Ziegler; the Harper Residence at Chestnut Hill, by McGoodwin & Hawley; "Tredinnock" at Ashbourne, by Lawrence Visscher Boyd; the Walton Residence at St. David's, by D. Knickerbacker Boyd; the Harris Residence, by Duhring, Okie & Ziegler, and the Lloyd Residence, by Bailly & Bassett, both in Villa Nova; the Moore Residence at Elkins Park, by Heacock & Hokanson; the Walker Residence at South Bethlehem, by Wilder & White; the large Tudor scheme of the two Glatfelter Residences at Spring Grove, by J. A. Dempwolf; the Ellis Residence at Bryn Mawr, by Wilson Eyre & McIlvaine. At Washington, D. C., was erected the French Renaissance design of G. O. Totten for the Moran Residence, and also the Parmelee Residence, by C. A. Platt; at Greensboro, N. C., the well scaled Colonial Brooks Residence, by A. Raymond Ellis; and at Annapolis the Labrot Residence, by Parker, Thomas & Rice. In the Middle West variety controls design and the whole gamut of stylistic possibilities is repeatedly tried. In Illinois were built, among others, the Paxter Residence at Lake Forest, by Richard Schmidt, Garden & Martin; the Riley Residence at Evanston, by Perkins, Fellowes & Hamilton; and at Chicago the Stevenson Residence, by George W. Maher, and the severe Italian Renaissance Blair Residence, by McKim, Mead & White. In Michigan: the Newbury Residence, by Trowbridge & Ackerman, the Speck Residence, by Albert H. Spahr, and the McMillan Residence, by Albert Kahn, all at Grosse Pointe; the Stevens Residence at Detroit, by George D. Mason & Albert C. MacDonald. From Louisville, Ky., was reported the attractive Allis Residence, by Lewis Coit Albro, and from Cleveland, Ohio, the Drury Residence, by Frank B. Meade & James M. Hamilton. Of the Western examples by far the greater number were again built in California, frequently using the Mission type of design, now destined to still greater popularity because of the success of the San Diego Exposition groups. To the fine residential district of Pasadena were added: the Harper Residence, by Reg. D. Johnson; the McWilliams Residence, by the same architect; and the Burnes Residence, by Myron Hunt & Elmer Grey. At San Diego was built the Putnam Residence, by Bristow & Lyman; at San Francisco the Ehrman Residence, by Willis Polk & Company; and in the rapidly growing residential town of Hollywood, a suburb of Los Angeles, the following: the Engstrom Residence, by F. A. Brown, of the *chalet* type, not by any means connoting the type of the same name on Swiss soil; the Russell Residence, by Elmer Grey; and "Yama Shiro," a highly attractive

Japanese villa scheme, standing on a knoll and approached by completely circular terraces, designed by Franklin M. Small. In Los Angeles proper were built the Denker Residence and the Sharp Residence, both by C. Cooper Corbett. In Texas, B. P. Briscoe designed the Garrow Residence at Houston, and in Denver, Col., were erected the Webster Residence and the Ross Residence, both by W. E. & A. A. Fisher.

MISCELLANEOUS. The chief railroad stations of the year, including also a few months of 1914, were: the N. Y. C. & H. R. R. stations at White Plains, N. Y., a brick building, by Warren & Wetmore, and at Hartsdale, N. Y., a brick and half-timber structure by the same firm; the Lehigh Valley R. R. station at Buffalo, by K. M. Murchison; the Pennsylvania R. R. station at Johnstown, Pa., by the same designer; the Santa Fé Station at San Diego, Cal., by Bakewell & Brown.

But few new theatres are recorded; the following may be mentioned: the Toy Theatre, Boston, Mass., a Georgian brick design, by Putnam & Cox; the Orpheum Theatre, Kansas City, Mo., by G. Albert Lansburgh; the Keeney Theatre, Brooklyn, N. Y., by Wm. E. Lehman.

Among the year's monuments should be noted: the excellent Spencer Trask Memorial, Saratoga, N. Y., by Henry Bacon and D. C. French; the Joseph Pulitzer Fountain, New York City, by Carrère & Hastings; the Arlington Amphitheatre, Washington, D. C., by the same firm; the Valley Forge Memorial, at Valley Forge, Pa., by Paul P. Cret; the Soldiers' Memorial at Westville, Conn., by Brown & VanBuren; the Eddy Monument, Mount Auburn Cemetery, N. Y., by Egerton Swartwout.

The only museum completed within the year was the Robert Dawson Evans Gallery, an extension of the Boston Museum.

EUROPE

GREAT BRITAIN. The following buildings of note were completed in England during the last 12 months. *Churches.*—All Saints' Church, Goodmayes, by P. K. Allen; St. Barnabas's Church, Mitcham, by H. P. Burke Downing; Our Lady and St. Casimir, London, by P. A. Lamb; Baptist Memorial Church, Twickenham, by Ingall, Bridgewater & Porter; St. Michael's and All Angels' Church, Beaconsfield, by G. H. Fellowes Prynne; St. Cuthbert's Church, Portsmouth, by E. Stanley Hall; Second Church of Christ Scientist, London, by John J. Burnet; Catholic Church, Northfleet, by G. Gilbert Scott; St. Michael and St. George's, Heswell, by Richard Beckett; St. Margaret's Church, Ilford, by Edwin T. Dunn; Liverpool Cathedral, a conscientious piece of stonework, designed by G. Gilbert Scott; St. Anselm's Church, Kennington, by Adshead & Ramsey, an easily recognized inspiration from Santa Maria della Grazie, Milan. *Schools.*—Lord Digby's School, Sherborne, by Edward C. H. Maidman; Wiggiston Grammar School, Leicester, by Howard S. Thomson; St. John's School, London, by A. H. Ryan Tenison; Bromsgrove School additions, Worcestershire, by Arthur Bartlett. *Universities, etc.*—The Liverpool University School of Architecture, by Professor Reiley; Rutherford College for Girls, Rutherford, by Marshall & Tweed; Lord Wandsworth's Institution for Agricultural Education, by E. Guy Dawber; St. Hugh's College, Oxford, by Buckland, Haywood & Farmer. *Hospitals.*—

The King Edward VII Memorial East Sussex Hospital, Hastings, by John Saxon Snell & Stanley M. Spoor; Royal Infirmary, Bristol, by H. Percy Adams & Charles H. Holden; Tuberculosis Dispensary, Sheffield, by F. E. P. Edwards. *Public Buildings*.—Metropolitan Water Board Offices, London, by H. Austen Hall; Government Buildings, Cardiff, by Richard J. Allison; Municipal Buildings, Stepney, by Nicol & Nicol; Board of Trade Offices, London, the largest single project of the year, the building of which has but recently been begun, by Vincent Harris; Municipal Buildings, Devonport, by Wilkinson & Binning; Police Buildings, Stockport, by Halliday & Paterson; British Colonial Government Building, London, by Alfred Burr. *Libraries*.—Carnegie Library, Diosbury, N. Manchester, by Henry Price. *Office Buildings*.—Westminster House for the American Tobacco Company, London, by Gordon & Gunton; Canada House, London, by Trehearne & Norman; British Dominion General Insurance Company's offices, London, by Arthur H. Moore; Premier Buildings, Liverpool, by G. deC. Fraser; Prudential Insurance Company's offices, Leicester, by Paul Waterhouse; Pearl Life Insurance Company's Building, London, by H. Percy Monckton; Alliance Assurance Company's offices, Sheffield, by Goddard & Catlaw; Cunard Building, Liverpool, by Willink & Thicknesse. *Banks*.—Capital and Counties Bank, St. Albans, by E. Brantwood Maufe; Royal Exchange, Manchester, additions by Bradshaw, Gass & Hope. *Residences*.—Brantham Court, Suffolk, by W. Harold Hillyer; "Monckton Croft," Alverstoke, by Wm. Acworth; "Great Roke," Witley, by M. T. Buckland & E. Haywood-Farmer; "Old Cleve," Lewes, by Rowland H. Halls; "Cariad," Goring-on-Thames, by W. T. Walker; "Islet," Maidenhead, by Ernest Flint; "North Lodge," Putney, by Williams & Cox; "Pembury Ridge," Pembury, by W. Henry White; "Overway," Tilford, by Henry M. Fletcher; "Beneffrey," Pollokshields, N. Glasgow, by Wm. Hunter McNab. *Homes*.—Edith Cavell Home for Nurses, London, by Rowland, Plumble & Partners. *Theatres*.—Carlton Theatre, London, by Charles T. Ruthen; Concert Hall, Worthing, by Peter D. Stonham. *Museums*.—Shipley Art Gallery, Gateshead, by Arthur Stockwell; Belfast Art Gallery, Belfast, by Geoffrey Lucas & Arthur Lodge. *Memorials, Monuments, etc.*—Lifford Memorial Hall, Broadway, by Andrew N. Prentice; Welsh National War Memorial, Cardiff, by Albert Toft; Margaret MacDonald Memorial, London, by Richard R. Goulden. *Miscellaneous*.—Wesleyan Hall, Stoke-on-Trent, by Reg. T. Longden; Institute of Marine Engineers, London, by Victor Wilkins; General Medical Council Meeting Hall, London, by Eustace C. Frere; Coburg Court Hotel, London, by Delissa Joseph; Regent's Park Restaurant, London, by John Belcher & J. J. Joass; Y. M. C. A. Building, Edinburgh, by G. Washington Brown. From other parts of the British Empire the following were reported: *Canada*.—Manitoba Parliament Buildings, a formal and uninteresting work, with Greek detail, by Frank W. Simon; Union Station, Quebec, by H. E. Prindle; Bancroft School, Montreal, by Nobbs & Hyde; First Church of Christ Scientist, Toronto, by S. S. Beman; St. Faith's Church, Edmonton, by Thomas G. Jackson; St. Michael's Church, Montreal, by Beaugrand-Champagne & Chenevert; Provincial Law Courts, Winnipeg, by Strachan; Bakery, Mon-

treau, by Sydney Comber; Rumely Products Company Building, Saskatoon, by Hill & Woltersdorf; Walker House, Ontario, by Burrows & Welles; Registry Office Building, Toronto, by C. S. Cobb; Fire Station and Recorder's Court, Maisonneuve, by Marius Dufresne; Putnam County Court House, Ottawa, by Frank L. Packard & Ralph Snyder; Dominion Express Building, Montreal, by Edward & W. S. Maxwell; Dominion Bank, Toronto, by Darling & Pearson; Police Headquarters, Calgary, by Lang & Major; Public Library, Regina, by Storey & VanEgmond; Knox College, Toronto, by Chapman & Griffin; University of Alberta, Edmonton, by Nobbs & Hyde. *India*.—Central Telegraph Office, and School of Tropical Medicine, Calcutta, by Henry A. Crouch; new Municipal Building, Karachi, by James Cumming Wynne; Cathedral of Colombo, Ceylon, by G. H. Fellowes Prynn. *Africa*.—Nairobi Cathedral, by Temple Moore; Town Hall and Municipal Offices, Johannesburg, by Hawke & MacKinley; Cathedral of Khartoum, Sudan, by Robert Schultz Weir.

CONTINENTAL EUROPE. From France and from Spain, and the invaded territories nothing whatever was reported. There was much discussion concerning the rebuilding of Belgium, this growing more animated with each recurring rumor of a possible peace at an early date. One of the most remarkable instances of economic self-sufficiency is that of Germany, which continues to build on an extensive scale, though its buildings are chiefly public, such as schools, hospitals, and homes; there are but few residences; nothing at all is done in the way of libraries, clubs, hotels, theatres, and the like, while there is, on the other hand, an enormous increase in industrial buildings. But little of this material can be reported in these columns because received too late for inclusion, since English control of the seas delays all periodicals, the only source of such information. A similarly interesting example is that of England, which, however, owes the continuance of its building activity to the large percentage of technical workers still available at home, while in Germany such activity is carried on only by those not required in the ranks. It is obvious that a continuation of hostilities over 12 or 18 months longer will undoubtedly result in a stagnation in all fields but that of hospital construction.

ARCTIC EXPLORATION. See POLAR RESEARCH, Arctic.

ARGENTINA. A Federal republic of southern South America. The capital is Buenos Aires, co-extensive with the Federal district.

AREA AND POPULATION. Argentina, or the Argentine Republic, consists of 14 provinces, 10 territories, and the Federal district. Estimates of the area, even those published by the Argentine authorities, differ considerably. The estimate which at present seems most acceptable is 2,987,356 square kilometers (1,153,417 square miles); another is 2,952,551 square kilometers (1,139,980 square miles); while a recent planimetric calculation made at the University of La Plata shows an area of 2,789,462 square kilometers (1,077,011 square miles). The census of 1895 returned a population of 4,044,911, including an estimate of 30,000 Indians and 60,000 others not censused. Recent estimates of population are not reliable, but it is certain that the number of inhabitants has rapidly increased. One estimate for 1912 is about 7,468,000; of

this number the Federal district was credited with 1,360,400, and the provinces of Buenos Aires, Santa Fé, and Córdoba, 2,017,200, 915,100, and 641,000, respectively. An estimate for Dec. 31, 1913, is 7,988,383. The Federal district (Buenos Aires city) has an area of 18,584 hectares, or about 72 square miles; its population, June 1, 1914, is reported at 1,560,163, and, as estimated for Jan. 1, 1915, 1,584,106, Buenos Aires being the largest city of the Southern Hemisphere and the largest Latin city of the world after Paris. Estimated population of other Argentine cities: Rosario (Dec. 31, 1912), 219,677; Córdoba, (1914), 135,000; La Plata (Dec. 31, 1912), 106,382; Tucumán (1913), 78,695; Bahía Blanca, 72,706; Mendoza, 60,000; Santa Fé, 48,600.

For the period 1857-1913 the number of immigrants by sea is reported at 4,550,402; emigrants, 2,949,137. Of the immigrants, Italians numbered 2,247,760; Spaniards, 1,420,393; French, 211,608; Russians, 155,285; Syrians, etc., 130,937; Austro-Hungarians, 85,053; Germans, 59,688; British, 53,792. Immigrants and emigrants in 1912 are reported at 323,403 and 120,260 respectively; in 1913, 302,047 and 181,056. Of the immigrants, in 1913, 215,871 were males. Of the total immigrants in that year, there were 122,271 Spaniards, 114,252 Italians, 19,542 Syrians, etc., and 18,616 Russians. Immigrants in 1914 are reported to number 115,308 (of whom 75,945 males); Spaniards numbered 52,211, and Italians 35,946. Emigrants in 1914, 178,684. Marriages in 1912 and 1913, 51,582 and 53,556; births, 272,071 and 286,181; deaths, 120,480 and 122,109.

EDUCATION. About one-half of the population over six years of age is illiterate, but the diffusion of elementary education is increasing. Primary instruction is free, secular, and nominally compulsory between the ages of 6 and 14. Estimated population of school age in 1913, about 1,275,000, of whom 804,000 were in school attendance. In that year there were 7247 primary schools (5894 public, 1353 private), with 22,964 teachers and 746,725 pupils. For secondary education there are 30 national colleges (about 8800 students) and 38 private schools of the same grade (3200 students). There are 67 normal schools (about 6600 students) and various establishments for commercial, industrial, technical, and other special instruction. There are national universities at Buenos Aires, La Plata, and Córdoba, and provincial universities at Paraná, Santa Fé, and Tucumán; students number about 7500, of whom the majority are at the University of Buenos Aires. There is no state religion, but the Roman Catholic Church receives government support.

PRODUCTION. Of the total area of the republic, over seven-tenths is stated to be productive. Of the two great industries, agriculture and stock-raising, the former in recent years has progressed the more rapidly, encroaching upon the grazing lands and forcing the flocks and herds farther from the cities and towns. The extension of the cultivated area is reported as follows, in thousands of hectares:

	1900-1	1908-9	1912-13	1913-14	1914-15
Wheat	3,380	6,063	6,918	6,574	6,261
Corn	1,255	2,974	3,830	4,152	4,203
Linseed	607	1,534	1,733	1,779	1,723
Alfalfa	1,512		5,955		
Oats		638	1,192	1,249	1,161
Barley		61	108	169	

	1900-1	1908-9	1912-13	1913-14	1914-15
Rye		10	40	92	
Potatoes		48	112	119	
Sugar cane		71	94	107	
Vines		122	102	106	

Total, including other . 7,811 22,988

Yield in 1913-14 and 1914-15 respectively (some of the figures being subject to slight revision): Wheat, 31,000,000 and 45,800,000 metric quintals; corn, 66,840,000 and 85,916,450; linseed, 9,950,000 and 11,255,000; oats, 7,400,000 and 8,310,000; barley, 1,750,000 in 1913-14; rye, 850,000 and 460,000; potatoes, 10,350,000 in 1912-13; raw sugar, 1,472,490 in 1913-14, and 2,761,400 in 1914-15; wine, 5,000,050 hectolitres in 1912-13, and 5,144,262 in 1913-14.

According to the live stock census of May 1, 1908, horses numbered 7,531,376; cattle, 29,116,625; sheep, 67,211,754; swine, 1,403,591; mules, 465,037; asses, 285,088; goats, 3,945,986. Live stock according to the census of May 1, 1908, and an estimate of 1914: Horses, 7,531,376 and 9,700,000; mules, 465,037 and 580,000; asses, 285,088 and 340,000; cattle, 29,116,625 and 29,500,000; sheep, 67,211,754 and 80,000,000; goats, 3,945,986 and 4,500,000; swine, 1,403,591 and 3,050,000.

Various minerals occur, including petroleum, but mining has not become of any great importance. Much capital is invested in meat packing, etc., and flour milling shows a considerable development.

COMMERCE. Imports and exports of merchandise have been valued as follows, in thousands of pesos gold:

	1900	1905	1910	1912	1913	1914
Imports—						
113,485	205,154	351,771	384,853	421,353	271,818	
Exports—						
154,600	322,844	372,625	480,391	483,505	349,254	

As the table shows, there was a very great decline in trade in 1914; this was due both to domestic economic conditions and to the war. In the last three months of the year wheat exports were suspended. The total wheat export for the year amounted to about 960,000 metric tons, as compared with 2,812,149 tons in 1913. Other important exports in 1913 were as follows: Corn, 4,806,951 metric tons; linseed, 1,016,732; oats, 889,745; bran, 274,058; wheat flour, 124,649; barley, 40,742; live cattle, 224,911 head; sheep, 103,977 head; frozen beef, 332,054 metric tons; chilled beef, 34,175; frozen mutton, 45,928; wool, 120,080; sheepskins, 20,124; goat skins, 2441; cattle hides, 86,974. Values of the more important exports in 1912 and 1913, in thousands of pesos gold: Corn, 108,908 and 112,292; wheat, 97,835 and 102,631; linseed, 34,214 and 49,910; wool, 58,149 and 45,270; cattle hides, 42,129 and 38,532; frozen and chilled beef, 34,285 and 36,623; oats, 21,859 and 20,447; rendered tallow and grease, 11,315 and 9445; wheat flour, 6926 and 7224; cattle, 9140 and 6849; sheepskins, 7657 and 5848.

The larger classified imports in 1912 and 1913, in thousands of pesos gold: Textiles and manufactures thereof, 78,370 and 89,560; iron and steel and manufactures thereof, 45,998 and 50,040; vehicles and railway equipment, 32,799 and

37,223; earthenware, glass, stone, earth, coal, etc., 33,617 and 36,578; building materials, 31,265 and 35,776; food products, 30,140 and 34,934.

Trade by principal countries is shown below in thousands of American dollars:

	Imports		Exports	
	1913	1914	1913	1914
United Kingdom	126,960	89,700	116,757	99,085
Germany	69,172	88,796	56,178	29,809
United States	60,172	35,586	22,208	41,681
France	36,934	21,722	36,587	19,872
Total, including others	408,712	263,663	468,999	338,777

The following figures show the percentage of imports and exports as shared by the leading countries:

	Imports			Exports		
	1912	1913	1914	1912	1913	1914
United Kingdom	30.8	31.1	34.0	25.3	24.9	29.2
Germany	16.6	16.9	14.8	11.3	12.0	8.8
United States	15.4	14.7	13.4	6.7	4.7	12.3
France	9.8	9.0	8.2	7.5	7.8	5.7
Italy	8.5	8.3	...	4.4	4.1	...
Belgium	5.3	5.2	...	7.8	6.8	...
Brazil	2.5	2.2	...	4.7	5.0	...
For orders	...	...	...	23.9	24.4	23.7

The exports "for orders" are not recorded at the Argentine ports as for specific countries, but are subject to cable or other orders for final destination. Nearly all of these shipments reach the western European countries, in about the same proportion as the direct shipments given in the foregoing table. Therefore the percentage of Argentine exports assigned to such countries as the United States and Brazil is in reality too high.

Imports and exports of merchandise at the principal ports, in 1913, in thousands of pesos gold: Buenos Aires, 337,643 and 170,445; Rosario, 37,111 and 90,575; Bahía Blanca, 13,381 and 55,772; La Plata, 10,005 and 43,065.

For the first half of 1915, imports were valued at 100,127,910 pesos gold, showing a decrease of 41.4 per cent as compared with the imports of the first half of 1914; exports, 310,910,368 pesos gold, showing an increase of 45.4 per cent. The balance of trade in favor of the republic during this period was the highest ever reached.

COMMUNICATIONS. The length of railway reported in operation in 1914 is 21,880 miles, of which 3481 miles belong to the state.

Railway mileage in 1915 amounted to 22,826 miles. The state railways were increased by 200 miles during 1914, giving a total mileage of 3209, of which 2908 miles were narrow-gauge. In the course of 1914-15 the Buenos Aires Great Southern Railway opened 65 miles of additional line, making its total mileage 3792 miles. The Buenos Aires Western Company also completed 34 miles of line upon the Valentin Gómez extension; and a second section of 41 miles of the same extension was also completed with the exception of station and other buildings. In 1914 and 1915 the railways of Argentina suffered considerably from the effects of floods, as the rainfall was so great that rivers and ordinary channels could not carry it off and great lakes were formed. With high winds the flood water was raised into waves and in many parts the track was undermined and washed away, requiring

extraordinary measures for protection of the line, including piling with wood, laying sheets of galvanized iron where the banks were most exposed, filling in washouts with cement and broken brick in wire netting, and similar measures. The extra cost to the Buenos Aires Western Railroad was \$600,000. Similar work was required on the Buenos Aires Great Southern and Central Argentine Railways.

Telegraph lines (1914), 43,153 miles (of which, national telegraph lines, 18,709 miles), with 131,586 miles of wire. Wireless telegraph stations, 12. Post offices, 3312.

FINANCE. The monetary unit is the peso (gold), equivalent to about 96.47 cents. Under the conversion law of 1899, the paper peso is current with a value of 44 per cent of the gold peso, or 42.46 cents. The budget for 1915 fixed the expenditures at 381,320,745 pesos paper. The budget submitted to the Congress for 1916 placed the expenditures at 343,207,692 pesos paper. The larger estimated ordinary expenditures for 1916 are: Treasury, 16,314,546 pesos, and 88,738,069 pesos, the latter sum being for account of the public debt; justice and public instruction, 57,863,292; interior, 45,298,017; war, 25,064,635; marine, 21,207,118. About half the ordinary revenue is derived from import duties, estimated at 149,000,000 pesos paper for 1915.

The national debt at the end of 1913 stood at 466,659,909 pesos gold; in addition, paper money in circulation, 178,082,840 pesos. At the end of 1914 the debt was 468,413,557 pesos gold, with 174,113,440 pesos paper in circulation.

NAVY. Argentina has 2 dreadnoughts, the *Rivadavia* and the *Moreno*, both launched in 1911, the former at Quincy, Mass., and the latter at Camden, N. J.; each displaces 28,000 tons. Besides the 2 dreadnoughts the navy includes 2 old coast guards (1890 and 1891), aggregating 4600 tons; 1 old coast guard (1880), of 4200 tons; 4 armored cruisers (1896 to 1898), aggregating 27,400 tons; 3 protected cruisers (1890 to 1895), aggregating 11,620 tons; 2 old torpedo cruisers (1890 and 1893), 1776 tons; 2 armored river gunboats (1908), 2100 tons; 11 torpedo-boat destroyers, 9000 tons; torpedo boats, transports, etc.

GOVERNMENT. Argentina is a federal republic. The executive is vested in a President, who is elected for six years by indirect vote, and is ineligible for the next term; he is assisted by a responsible ministry of eight members. The legislative power devolves upon a Congress of two houses, the Senate and the Chamber of Deputies. Senators are 30 in number, elected indirectly for nine years, two from each province and the Federal district. Deputies, numbering 120, are elected for four years by popular vote. Roque Sáenz Peña, elected President for the term ending Oct. 12, 1916, died on Aug. 9, 1914, and was succeeded by the Vice-President, Victorino de la Plaza.

HISTORY

EFFECT OF THE WAR UPON ARGENTINA. Argentina suffered, as well as the other South American countries, from the effects of the war in Europe, but recovered more rapidly than the others. On January 2nd the republic floated a loan for \$15,000,000 in New York, Chicago, Boston, Pittsburgh, and Philadelphia. The notes were all taken up within a few hours by the

bankers of these cities. This was the first time that the United States had ever negotiated a direct loan to any South American country. With the aid of this loan Argentina was able to bolster her financial administration until it again reached its normal condition. In May the government made a second attempt to secure money by means of a loan. This time it decided to issue \$50,000,000 worth of Treasury warrants, half of which were to be sold in the United States and the other half in England. American financiers subscribed to their half of the loan in less than a week's time, but London bankers received the proposition with less enthusiasm and at the end of a week had subscribed to only 12 per cent of their share. This augured well for the formation of a closer relationship between Argentina and the United States than had been possible hitherto because of the dependence of Argentina on British financial backing.

THE "ABC" PEACE TREATY. Coincident with its celebration of the 105th anniversary of the formation of the republic Argentina, on May 25th, acted as host to the ministers of Brazil and Chile while the ABC treaty of peace was being signed. This was the first actual treaty between the three strongest powers of South America, although they had worked harmoniously together on several occasions when the interests of all demanded it. The treaty which was signed at Buenos Aires on May 25th by Señor Alejandro Lira of Chile, Dr. Lauro Muller of Brazil, and Señor José L. Murature of Argentina, provided for five years of peace between the three nations, during which time each of the three nations was pledged not to make war against either of the others until the causes of conflict had been investigated and reported upon by an impartial commission.

ARGENTINA AND THE UNITED STATES. Argentina acted in connection with the United States in attempting to bring about a reign of law and order in Mexico, and was one of the nations which recognized Carranza, after the latter had been selected as Provisional President of Mexico by the representatives of the seven American nations. Argentina likewise took part in the Pan-American Financial Congress in May, her delegates being Samuel Hale Pearson, one of Argentina's leading financiers, Richard C. Aldao, a prominent attorney, V. Villamil, and John E. Zimmerman, business men. All urged closer relations between Argentina and the United States. The establishment of a branch bank at Buenos Aires by the National City Bank of New York was thought by the delegates to be a splendid instrument in bringing about this relationship. President Wilson while attending a dinner, given in his honor by Ambassador Naón, on board the Argentine battleship *Moreno* in March, said:

"I want to congratulate you upon the completion of this ship and upon all that she stands for in the way of reciprocity between ourselves and the great country you represent, and I want to express my feeling as President of the United States that we are rapidly approaching a day when the Americans will draw together as they have never drawn together before, and that it will be a union, not of political ties, but of understanding and of mutual helpfulness."

CABINET CHANGES. In August, Minister of Finance Carbo and Minister of Justice Cullen resigned their portfolios, and were succeeded,

respectively, by Francisco Oliver and Carlos Saavedra.

ARIZONA. POPULATION. The estimated population of the State on July 1, 1915, was 247,299. It was 204,354 in 1910.

AGRICULTURE. The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture in 1914-15, were as follows:

		Acreage	Prod. Bu.	Value
Corn	1915	20,000	600,000	\$690,000
	1914	18,000	576,000	691,000
Wheat	1915	39,000	1,092,000	1,256,000
	1914	31,000	868,000	1,085,000
Oats	1915	9,000	333,000	213,000
	1914	8,000	336,000	235,000
Barley	1915	35,000	1,295,000	725,000
	1914	35,000	1,260,000	756,000
Potatoes	1915	1,000	95,000	95,000
	1914	1,000	110,000	132,000
Hay	1915	147,000	a 470,000	4,512,000
	1914	142,000	454,000	3,995,000

a Tons.

MINERAL PRODUCTS. The value of the production of gold, silver, copper, lead, and zinc in 1914 was \$59,956,029, compared with \$70,875,027 in 1913, a decrease of \$10,918,998. The gold produced in the State in 1914 amounted to 202,167 ounces, valued at \$4,179,155, an increase of \$155,244; silver production increased from 3,948,091 ounces, valued at \$2,384,647, in 1913, to 4,377,994 ounces, valued at \$2,441,417, in 1914. The copper output from the ores of the State, chiefly from crude ores and concentrates, decreased from 407,923,402 pounds, valued at \$63,228,127, in 1913, to 393,017,400 pounds, valued at \$52,271,314, in 1914. In spite of this decrease, Arizona continued at the head of the list of copper producing States. The lead in Arizona ores in 1914, which were shipped to smelters outside the State, amounted to 15,003,068 pounds, valued at \$585,125, compared with 16,144,772 pounds in 1913. The spelter recovered from Arizona zinc ores in 1914 amounted to 9,792,337 pounds, valued at \$449,409, compared with an output of 9,928,067 pounds, valued at \$527,972, in 1913. There were during the year 395 producers engaged in the production of copper, gold, silver, lead, and zinc, compared with 380 in 1913. The production of gold from the mines of the State in 1914 was greater than that of any previous year. Lead ores yielded 494,226 ounces of silver in 1914. Of the total output of silver for the year, 3,286,267 ounces came from crude ore shipped to smelters, 423,892 ounces from concentrates shipped, and 617,049 ounces from mill bullion. The value of the State's total mineral production in 1914 was \$60,391,272 compared with \$71,429,705 in 1913. This represented a decrease of 15.5 per cent. Arizona ranked seventh in value in 1914.

FINANCE. At the beginning of the fiscal year 1914 there was in the treasury a balance of \$1,034,183. The receipts for the year amounted to \$2,770,571, and the disbursements to \$3,051,356, leaving a balance in the treasury of \$703,298. The bonded debt of the State, consisting wholly of bonds, of which the greater part was issued for funding purposes, amounted to \$3,500,000.

EDUCATION. The total school population in the State in 1915 was 56,471. The total enrollment in the public schools was 43,316, with an average daily attendance of 29,582. Teachers numbered 160 male and 1059 female. The total

school expenditure for the year was \$1,348,242.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include a State Hospital for the Insane, State Prison, State Industrial School, and State Home for Aged and Infirm Pioneers. During the year the Legislature enacted a law giving city police courts concurrent jurisdiction with justices of the peace, also a law providing for the administration of relief to the amount of \$10,000 in Navajo County, and \$30,000 in Apache County, on account of floods due to the breaking of the reservoir. Since the operation of a State-wide prohibition law on the first of the year the number of arrests in city and county courts decreased considerably, and the population of the prisons declined from 565 in September, 1914, to 400 in September, 1915. An old age and mothers' pension law was passed by the Legislature, was taken to the courts, and was at the end of the year awaiting a hearing before the Supreme Court.

TRANSPORTATION. The railway mileage in the State on June 30, 1915, was 2989. Railways having the longest mileage are the Atchison, Topeka and Santa Fé, 1159; Southern Pacific, 682; Arizona Eastern, 448; and the El Paso and Southwestern, 349.

POLITICS AND GOVERNMENT. The Legislature met in 1915, but passed no measures of unusual importance. The United States Court in San Francisco, on January 7th, declared the anti-alien employment act adopted by the voters of the State in November, 1914, unconstitutional, as being in conflict with the 14th Amendment to the Constitution. The act provided that not more than 20 per cent of the employees of a firm should be aliens. A substitution bill, passed by the House of Representatives on February 9th, provided among other things that all persons engaged in hazardous occupations should be able to read and write English. This bill was defeated in the Senate. The anti-alien law was carried to the United States Supreme Court, but no decision had been rendered at the end of the year. A State-wide prohibition bill went into effect in the State on Jan. 1, 1916, as a result of the constitutional amendment adopted Nov. 3, 1914. The law was contested, and was upheld in all points by the State Supreme Court on February 13th.

STATE OFFICERS. Governor, George W. P. Hunt; Secretary of State, Sidney P. Osborn; Assistant Secretary, R. E. McGillen; Auditor, J. C. Callaghan; Treasurer, Mit Sims; Attorney-General, Wiley E. Jones; Superintendent of Public Instruction, C. O. Case; Adjutant-General, Charles W. Harris; Superintendent of Public Health, R. N. Looney—all Democrats.

SUPREME COURT. Chief Justice, Henry D. Ross; Associate Justices, Alfred Franklin, D. L. Cunningham; Clerk, C. F. Leonard.

STATE LEGISLATURE.

Republicans	1	0	1
Democratic majority..	17	35	52

ARIZONA, UNIVERSITY OF. A State university for higher education founded in 1885 at Tucson, Arizona. The students enrolled in the several departments in the autumn of 1915 were 400. The faculty numbered 52. There

were added during the year to the faculty D. H. H. Foster, head of the Department of Education; Dr. S. J. Frank, head of the Department of Law; Dr. H. M. Colvin, instructor in Law and Economics; Dr. H. M. Leonard, head of the Department of Mathematics. Dr. E. S. Bates, head of the Department of English, resigned. There were no noteworthy benefactions received during the year. The university is almost entirely supported by legislative appropriations. The receipts amount to about \$350,000 annually. The library contains about 22,359 volumes. The president is R. B. Von Kleiss Smid.

ARKANSAS. POPULATION. The estimated population of the State on July 1, 1915, was 1,713,102. The population in 1910 was 1,574,449.

AGRICULTURE. The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1914-15 were as follows:

		Acreage	Prod. Bu.	Value
Corn	1915	2,700,000	62,100,000	\$39,744,000
	1914	2,400,000	42,000,000	33,600,000
Wheat	1915	220,000	2,750,000	2,778,000
	1914	125,000	1,625,000	1,609,000
Oats	1915	375,000	10,125,000	5,265,000
	1914	280,000	6,240,000	3,807,000
Rye	1915	1,000	10,000	10,000
	1914	1,000	10,000	10,000
Rice	1915	100,000,000	4,840,000	4,598,000
	1914	92,580,000	3,685,000	3,316,000
Potatoes ...	1915	28,000	2,520,000	3,022,000
	1914	25,000	1,500,000	3,315,000
Hay	1915	350,000	a 560,000	5,768,000
	1914	320,000	336,000	4,334,000
Tobacco ...	1915	500	b 300,000	51,000
	1914	700	427,000	77,000
Cotton	1915	2,150,000	c 785,000	43,590,000
	1914	2,480,000	1,016,000	32,084,000

a Tons. b Pounds. c Bales of 500 pounds gross weight.

MINERAL PRODUCTS. The coal production of the State in 1914 was 1,836,540 tons, valued at \$3,158,168. This is a decrease of 397,567 tons from the production of 1913. This is attributed to the falling off of the use of coal for manufacturing purposes, due to demoralization in the cotton industry, and to the decrease in the domestic consumption, because of mild weather during the winter of 1914. There were labor troubles during the year, and 1415 men, or about one-third of the total number employed, were on strike for one reason or another. There were during the year 11 fatal accidents in the coal mines of the State. The total value of the mineral products of the State in 1914 was \$5,785,199.

TRANSPORTATION. The total railway mileage in the State on June 30, 1914, was 5335.

FINANCE. The total receipts from Jan. 1, 1915, to Sept. 30, 1915, amounted to \$3,730,651. The disbursements for the same period amounted to \$3,711,340. There was a balance at the beginning of the fiscal year of \$234,744, and at the end of \$254,055. The chief source of revenue is direct taxation. The chief expenditures are for charitable institutions, agricultural schools, and the University of Arkansas. The bonded debt of the State was \$1,250,500.

EDUCATION. The total school population in the State on June 30, 1915, was 649,689. The enrollment in the public schools was 453,834, with an average daily attendance of 302,963. There were 10,832 teachers, who received an average annual salary of \$303.50. The total

expenditures for the support of schools was \$4,470,936.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State under the control of the State Board are the State Hospital for Nervous Diseases at Little Rock, Deaf Mute Institute at Little Rock, School for the Blind at Little Rock, the Confederate Soldiers' Home at Sweet Home, Arkansas State Penitentiary and State Farm, and the Arkansas State Reform School at Little Rock.

POLITICS AND GOVERNMENT. The Legislature met in 1915, and passed several measures of importance. The first of these related to the matter of liquor regulation. A State-wide prohibition bill known as the Newberry Bill passed the House of Representatives on February 1. This measure prohibits the sale or giving away of liquor after June 1, 1915. It made a violation of the law a felony, and provided for prison terms of not less than one year. The Senate adopted the bill with an amendment that it become effective on July 1, 1915. It was signed by Governor Hays. The Senate on February 1 passed a resolution referring a constitutional amendment providing for woman suffrage to popular vote. On account of the provision of the State Constitution which provides for the submission of not more than three proposed amendments to the Constitution at any election, it was necessary to defer the settlement of the question for two years.

STATE OFFICERS. Governor, George W. Hays; Secretary of State, Earle W. Hodges; Auditor, M. F. Dickenson; Treasurer, Rufus G. McDaniel; Attorney-General, Wallace Davis; Commissioner of State Lands, Highways, and Improvements, William B. Owen; Commissioner of Mines, Manufacture, and Agriculture, John H. Page; Superintendent of Public Instruction, George B. Cook.

SUPREME COURT. Chief Justice, E. A. McCulloch; Associate Justices, Carroll D. Wood, J. C. Hart, W. F. Kirby, and Frank Smith.

ARKANSAS, UNIVERSITY OF. A State institution for higher education established in 1872, at Fayetteville, Arkansas. There were in attendance in all departments in the autumn of 1915, 783 students. The faculty numbered 75. There were no notable changes in the faculty, and no noteworthy benefactions were received. The library contains about 25,000 volumes. The president is J. C. Futrall, M.A.

ARMENIAN CASE. See UNITED STATES AND THE WAR.

ARMIES. See MILITARY PROGRESS, and section *Army*, under the various countries.

ARMSTRONG, PAUL. American dramatist, died Aug. 30, 1915. He was born in Kidder, Mo., in 1869, and began life as a sailor on the Great Lakes, eventually becoming master of a steamer. Later he went to New York, and engaged in journalism. During this period he wrote his first play, *A Night in the Police Station*. His first success was *The Heir to the Hoorah*, produced in 1904. This was followed by *Salomy Jane* (1905) and by his greatest

success, *Alias Jimmy Valentine* (1909). He collaborated in *Via Wireless* (with Winchell Smith, 1909), *Going Some* (with Rex Beach, 1909), and *Deep Purple* (with Wilson Mizner, 1911). Nearly all Mr. Armstrong's plays met with unusual success.

ART. See ARCHITECTURE; MUSIC; and PAINTING AND SCULPTURE.

ART EXHIBITIONS. See PAINTING AND SCULPTURE.

ARTILLERY. See MILITARY PROGRESS, and section *Army*, under UNITED STATES, and under various foreign countries.

ASBESTOS. This has never been produced in large quantities in the United States. The annual production has ranged from 71 short tons in 1890 to 7604 in 1911. In 1914 there was an increase in the output of high grade crude fibre. The total amount of asbestos mined and sold in that year was 1247 short tons, valued at \$16,810, compared with 1100 valued at \$11,000 in 1913. Asbestos is produced practically in only two States, Georgia and Arizona, though small quantities are mined in California and Virginia. The largest production is from Georgia. Canada is the principal source of the world's supply of asbestos, and large quantities are imported into the United States. These, during the twelve months ending Dec. 31, 1914, amounted to 71,781 short tons, or more than 74 per cent of all the asbestos mined in Canada. The value of the manufactured and unmanufactured asbestos imported for consumption in the United States in 1914 was \$1,779,223.

ASIA. See ANTHROPOLOGY; EXPLORATION; and articles on the various Asiatic countries.

ASPHALT. Although there was a decrease in the marketed production of asphalt and of manufactured or oil asphalt derived from domestic sources in the United States in 1914, the decrease was more than offset by the greatly increased output of oil asphalt derived from crude petroleum imported from Mexico. The output of natural asphalt amounted to 77,588 short tons, valued at \$630,623; the output of oil asphalt from domestic petroleum amounted to 360,683 short tons, valued at \$3,016,969; and the output from American refineries of oil asphalt from Mexican petroleum amounted to 313,787 short tons, valued at \$4,131,153. In Texas and Utah the output of certain varieties of natural asphalt, required for special purposes, showed an increase. In California there was a notable increase of oil asphalt, derived wholly from domestic petroleum. During the calendar year 1914 asphaltic material and productions to the value of \$186,142 were imported. Exports during the same period were valued at \$1,247,020.

ASPHYXIATING GASES. See CHEMISTRY, INDUSTRIAL; and MILITARY PROGRESS.

ASQUITH, HERBERT HENRY. See GREAT BRITAIN, *History, passim*.

ASTRONOMY. During 1915 the American observatories maintained their usual high level of productivity in the field of astronomical research, but, owing to the European war, a marked decrease of activity on the part of the observatories of the Old World was evident. Further details concerning the ninth satellite of Jupiter, discovered by Prof. Seth B. Nicholson in 1914, were published, and this tiny celestial body is now firmly established as a

member of the Jovian family of satellites. The periodic comets discovered by Winnecke and Tempel in 1858 and 1873, respectively, reappeared, and three new comets were found. The death roll of the year included the names of Arthur Auwers, famous for his re-reduction of Bradley's observations and the compilation of star-catalogues; Lady Huggins, the able assistant of her distinguished husband, the late Sir William Huggins, in his epoch-making researches in astrophysics; G. F. Chambers, whose popular works on astronomy have been largely instrumental in spreading a general knowledge of the science; and Theodore Albrecht, chief of the International Bureau for the Investigation of Latitude Variation from its foundation in 1898.

MOUNT WILSON SOLAR OBSERVATORY. In his report of the work accomplished by himself and his assistants at this observatory during 1914, Prof. George E. Hale called attention to the fact that the opening of the second decade of the existence of the observatory was marked by a vigorous revival of solar activity after a prolonged period of calm. The first decade was remarkable for the amount of work accomplished and the new fields of inquiry in solar physics which were opened up. The skill of the director and his co-workers in devising new methods of research was unparalleled in the history of astronomical activity in this field, and it is not too much to say that, in quality, as well as quantity, of output, the observatory stood unrivaled among those devoted to the investigation of the physics of the sun. The methods which were developed and tested during the first decade became firmly established and gave promise of even greater and more important results for the future. The year 1914 was one of the most productive in the history of the observatory. The principal conclusions derived from the work of the year were summarized under 59 heads. Investigations were made of the general magnetic field of the sun, and of the magnetic fields of sun spots. In the case of the former, its existence was shown by 25 lines, representing the elements iron, chromium, vanadium, and nickel (with one unidentified), and all originating at comparatively low levels in the solar atmosphere. Attempts were made to observe the Stark effect due to electric fields in sun spots, but yielded no positive results. On "flash" spectra taken without an eclipse more than 1000 bright lines were measured, surpassing in number those photographed in the same region of the spectrum at eclipses and representing a lower level in the solar atmosphere. A preliminary study of the displacements of solar lines at the sun's centre gave no evidence of the gravitational shift toward the red predicted by Einstein, and the results also failed to support the anomalous dispersion theory advanced by Julius. From an investigation of the levels of the various elements in the sun's atmosphere, the conclusion was reached that the great mass of the vapors present is condensed in a very thin layer close to the photosphere.

The first determinations of stellar parallax with the 80-foot Cassegrain combination of the 60-inch reflector were completed and found very satisfactory. The enormous velocity in space of 577 kilometers per second was found in the

case of the star O. Arg. S. 14320. By the measurement of some 600 stars near the North Pole, there was established for stars from the second to the twentieth magnitude a photographic scale, which agrees closely with the Harvard scale for the middle interval but shows divergencies for both bright and faint stars. The disappearance of the chief nebular lines from the spectra of Nova Aurigæ and Nova Persei was observed; these spectra are now identical with those of certain Wolf-Rayet stars, and it is suggested that the latter may be temporary stars in the later stages of their history. Work on the 100-inch mirror was steadily maintained, an almost perfectly spherical figure being obtained, and preparations for its parabolization were made, including the completion of the 60-inch plane mirror for testing its figure.

POLARITY OF SUN SPOTS. When the magnetic polarity of sun spots was discovered at Mount Wilson in 1907, it was expected that the spot vortices in the northern and southern hemispheres of the sun would have opposite directions of rotation. This expectation was not immediately realized, for spots showing opposite directions of rotation were soon observed in each hemisphere. Professor Hale's discovery of bipolar spots in 1909, however, afforded a basis for a reconsideration of the whole question, and it was found that, if every spot were classified as the preceding or following member of a bipolar group, as a rule the preceding (or following) spots in opposite hemispheres showed opposite polarities. Later work at Mount Wilson on the polarity of sun spots brought out the interesting fact that, while in the new spot cycle just begun the rule of opposite polarity for the preceding (or following) spots in the two hemispheres still holds, the polarities in a given hemisphere are opposite to those observed in that hemisphere just before the recent spot minimum. Since, in accordance with the well-known law of sun spot distribution, the spots of a cycle appear at first in high solar latitudes and descend as the cycle progresses, it seems likely that the polarity is determined by the solar latitude, and it is suggested that the simplest explanation of the anomaly lies in assuming the existence of high and low latitude zones, distinguished by spots of opposite polarity. Future observations are expected to test this view, and also to reveal what happens in the intermediate zone.

SOLAR RADIATION CONSTANT. In spite of the extremely accordant values of the solar radiation constant obtained by Messrs. Abbot, Fowle, and Aldrich, of the Smithsonian Institution, from measurements made under diverse conditions of height above sea level, atmospheric transparency, temperature, etc., their results were severely criticized. It was urged by some that their allowance for the heat absorbed by the atmosphere was too low; by others it was claimed that the amount of solar radiation reflected from the outside of the atmosphere was underestimated, and that the true value of the constant should be at least 3, and perhaps as high as 4 calories per square centimeter per minute instead of 1.93 calories, the value deduced by the Smithsonian observers. This value was derived from nearly 1000 measurements made during the period 1903-1914 at

Washington (sea level), Bassour, Algeria (1160 meters), Mount Wilson, California (1730 meters), and Mount Whitney, California (4420 meters). In addition, a series of high-altitude observations, in which sounding balloons were used, was carried out by the Smithsonian Institution in cooperation with the United States Weather Bureau during the summers of 1913 and 1914. On July 14, 1914, a *ballon sonde* carrying a recording pyrheliometer was released at Omaha, and reached a height of 24,000 meters, or nearly 15 miles. The mean value of the solar radiation constant deduced from the best three records made on this occasion was 1.84 calories, or, when corrected for the radiation scattered and absorbed in the atmosphere above the level attained, 1.88 calories, a value which accords satisfactorily with the value previously obtained.

MARS. Spectrograms were obtained at the Lowell Observatory showing strongly intensified oxygen and water vapor bands as compared with similar bands in lunar spectrograms. It was claimed that they prove that the water vapor in the Martian atmosphere is almost entirely confined to the regions over the melting snows at the poles of the planet. The amount of oxygen in the Martian atmosphere was estimated to be about half as great as in our own.

During the opposition of Mars, Prof. W. H. Pickering issued a series of monthly reports dealing with the planet. The cooperation secured by means of these reports proved so valuable that the formation of a permanent association for the systematic observation of the planet was contemplated.

THE NINTH SATELLITE OF JUPITER. In the YEAR BOOK for 1914, mention was made of the discovery of a new satellite of Jupiter by Prof. Seth B. Nicholson at the Lick observatory on July 21, 1914. The first record of this—the ninth—satellite of Jupiter was obtained on plates which had been exposed for the purpose of securing positions of the fainter satellites of the planet. It is a tiny body of the nineteenth magnitude only, and is therefore even fainter than the eighth satellite near which it was found. Like the latter, it is differentiated from the older satellites discovered by Galileo by its great distance from the primary, its small size, the high inclination of its orbit, and its retrograde motion. The latest determination of its elements gave for its distance from the primary 14,700,000 miles, or about 340 times the radius of Jupiter, and for its period 796 days. The corresponding figures for the eighth satellite are 13,950,000 miles and 739 days, respectively. The close resemblance between the orbits of the two satellites suggests they were added to the Jovian system in the same way, possibly by capture from outside space.

STELLAR PHOTOMETRY. In an important paper read before the National Academy of Sciences, Prof. Joel Stebbins, of the University of Illinois, gave an account of his recent researches on the electrical photometry of stars. In these researches he employed a selenium cell which served as one arm of a Wheatstone bridge, the intensity of the light falling on the cell from any bright source being determined from the diminution of the resistance of the cell. The difficulty of the problem

becomes apparent when it is realized that the measurement of the light of a star like the Pole Star with a probable error of 1 per cent is equivalent to the detection of a candle at a distance of about a mile. Increased sensitiveness of the apparatus was secured by surrounding the cell with an ice-pack so as to maintain it at a low temperature. Observations were made on eclipsing binaries of three types, namely, Algol, in which a bright star is accompanied by a large faint companion; β Aurigæ, a spectroscopic binary with components of practically equal size and brilliancy; and δ Orionis, in which the components are equally brilliant but unequal in size. The periodicity of Algol, which loses about $\frac{1}{10}$ of its light once in every 69 hours, the temporary eclipse lasting about 12 hours, was discovered in 1783 by Goodricke, who suggested as the cause of the phenomenon the periodical interposition of a large dark satellite. Unless the companion star is entirely dark, there should be another loss of light midway between two successive primary eclipses, but no such loss has ever been observed visually. With the selenium photometer, however, Stebbins was able to detect a diminution of about 6 per cent, proving conclusively that the companion, while dark, is not entirely so. In the case of β Aurigæ, spectroscopic observation has shown that we have a system of two bodies revolving round each other in a period of about four days. Although it is impossible to separate the two stars in the telescope, still the eclipses of one star by the other can be determined spectroscopically, for, whenever they occur, the spectrum lines are seen single instead of double, as they are when light waves are received from both components simultaneously.

The photometric observations showed that at the precise times when the eclipses take place the light of the system is diminished by 7 per cent, successive diminutions following one another at intervals of half the period. It was estimated that the surface brightness of each body is 12, and possibly 25, times that of the sun, the total light emitted by the system being from 150 to 300 times the solar light. In the case of δ Orionis, the observations indicated that the two components of the system have almost equal intensities but differ in size, the radius of the smaller being only half that of the larger. Professor Stebbins also succeeded in constructing a photoelectric cell from one of the alkali metals which is twice as sensitive as anything of the kind hitherto available, and far more uniform in its action than the selenium cell. A tenfold improvement over the best obtained with the selenium cell was expected from the later apparatus, and the results of the further prosecution of his researches were awaited with interest.

THE ORION NEBULA. In the YEAR BOOK for 1914, attention was drawn to the spectroscopic evidence of rotation in the Virgo nebula which had been recently obtained by Professor Slipher of the Lowell observatory. Further evidence of nebular rotation was found by Messrs. Buisson, Fabry, and Bourget in their studies of the great nebula in Orion. The interferometer method was used. Interference rings were formed with light of known wave-length from the nebula, and the wave-length for this particular ray was then calculated from the size

of the rings produced. Any decrease or increase of wave-length is of course due to the Doppler effect, and the radial velocity of the region of the nebula from which the light was derived can be easily determined. It was found that, on the whole, the nebula has a rotary motion about a line running from northwest to southeast, though many irregularities were observed; and that the northeast region is withdrawing at the rate of about 5 kilometers per second relatively to the axis of rotation, while the southwest region is approaching with about the same relative velocity. In the region surrounding the Trapezium a mean radial velocity of 15.8 kilometers per second relative to and directed away from the sun was obtained. The atomic weight of nebulum and the temperature of the nebula were also investigated. It was found that the two distinctive lines in the ultra-violet are emitted by an element of approximate atomic weight three, which agrees with the theoretical atomic weight of nebulum, but the conclusion was reached that the green line usually associated with that element belongs to another element of even lower atomic weight. The temperature of the nebula was estimated to be 15,000°C.

MEASURING THE HEAT OF THE STARS. In a recent contribution to the *Bulletin of the Bureau of Standards*, Prof. W. W. Coblentz described his important work of measuring the amount of heat radiated from the stars. Several previous attempts had been made to determine the amount of stellar radiation. One of the earliest was by Sir William Huggins, who employed a thermoelement to measure the minute amounts received from Sirius, Pollux, Regulus, and Arcturus, but his results were qualitative rather than quantitative. Stone, somewhat later, and, quite recently, Pfund, were more successful in their application of the thermoelement to this problem. Stone's observations were confined to Arcturus and Vega, and showed that the former emitted more radiation than the latter in the ratio of 3 to 2. Pfund investigated Jupiter, Vega, and Altair, and concluded that, with one of the largest reflectors and a more sensitive galvanometer, it would be possible to make measurements in the case of stars down to the fourth magnitude. In 1901 Nichols made use of his improved radiometer which was so sensitive that a candle placed at a distance of 5 miles would have given a deflection of 1 mm. on his galvanometer scale. For Arcturus and Vega he found a somewhat higher ratio than that obtained by Stone. The telescope employed by Professor Coblentz was the large Crossley reflector of the Lick observatory. By using for his radiometer a bismuth-platinum thermocouple mounted in vacuo, he succeeded in securing a sensitivity more than 100 times as great as that of the Nichols radiometer, so that a deflection of 1 mm. would be produced by a candle at a distance of 53 miles. Measurements were made on 112 celestial objects, including 105 stars, the bright and dark bands of Jupiter, a couple of Jupiter's satellites, the rings of Saturn, and a planetary nebula. Quantitative measurements of stars down to magnitude 5.3 were obtained, and it was found possible to get qualitative results in the case of stars as faint as magnitude 6.7. Red stars were found to emit from two to three times as much total radiation as

blue stars of the same photometric magnitude. As an indication of the extremely minute amounts of stellar radiation involved, it is stated that, if the radiation from the Pole Star falling on a square centimeter of the earth's surface could be absorbed and conserved, it would take a million years to raise the temperature of one gram of water 1°C, while the total radiation from all the stars similarly absorbed and conserved would require from 100 to 200 years. This is in marked contrast to the solar radiation, which can produce the same effect in about a minute.

MINOR PLANETS. Although the number of minor planets announced as new in 1911, 1912, and 1914 showed some diminution when compared with the numbers discovered annually during the period 1906-1910, there appears to be no indication that the exhaustion of the zone is near. Since the issue of the *YEAR BOOK* for 1914, 74 of these small bodies have been reported, and have been assigned provisional designations ranging from 1914 VS to WH, and 1915 WJ to YH, together with 1901a, 1913k to o, and 1914a and b, the single-letter designations being due to belated recognition or reporting. It will be observed that in 1915 we were nearing the end of the second series of double-letter designations. Of the 24 minor planets not properly belonging to 1915, the five designated 1913k to o were discovered by Metcalf at Winchester, Mass.; 1914a and b were found by Beljawsky at Simeis; and 1901a was detected on an old plate exposed by Wolf at Heidelberg as far back as 1901, having been overlooked at the time of its discovery. Of the remaining 16 belonging to 1914, 5 were reported from Heidelberg, 4 falling to the share of Professor Wolf, and 1 to his assistant Reinmuth, while the rest were discovered by Neujmin at Simeis. This year the Heidelberg observatory claimed more than half of the total number of minor planets announced as new, no fewer than 29 having been found by Wolf (27), and Reinmuth (2). Of the remaining 21, 9 were reported from Simeis (7 by Neujmin, and 2 by Beljawsky), 6 by Thiele (Bergedorf), 3 by Tomás Solá (Barcelona), 2 by Palisa (Vienna), and 1 by Demetrescu (Bucharest). One surprising feature of the year's work in this field was the number of long-missing planets which were re-observed. 1915 WJ, discovered by Wolf, proved to be the long-lost 99 Dike, last seen in 1868, the year of its first discovery, and 1915 XU is probably identical with 193 Ambrosia. Other minor planets not observed since their discovery and re-found in 1915 were 290 Bruna (1890), 353 Ruperta-Carola (1893), 392 Wilhelmina (1894), 493 Griseldis (1902), 573 Rebekka (1905), and 594 Mireille (1906); of these, 392 is identical with 1914 WG, 493 with 1915 WK, and 572 with 1915 WU.

Permanent numbers were assigned to the following minor planets:

Number	Temporary designation	Discoverer	Date of discovery
792	1907—ZC	Metcalf	1907—Mar. 20
793	ZD	Lowell	Apr. 9
794	1914—VB	Palisa	1914—Aug. 27
795	VE	Palisa	Sep. 26
796	VH	Reinmuth	Oct. 15
797	VR	Thiele	Nov. 17
798	VT	Wolf	Nov. 21
799	1915—WO	Reinmuth	1915—Mar. 9

Number	Temporary designation	Discoverer	Date of discovery
800	WP	Wolf	Mar. 20
801	WQ	Wolf	Mar. 20
802	WR	Wolf	Mar. 20
803	WS	Palisa	Mar. 21
804	WT	Comas Solá	Mar. 20
905	WW	Wolf	Apr. 17
806	WX	Wolf	Apr. 18
807	WY	Wolf	Apr. 18

Other identifications were as follows: 1914 VS = 490 Veritas; 1915 XO = 468 Lina.

COMETS. Three comets of short period—Winnecke's, Tempel's Second, and Swift's—were due to reappear in 1915. The first two were observed, and were designated 1915b and 1915c, respectively. Winnecke's comet, originally discovered by Pons in 1819 and rediscovered by Winnecke in 1858, has a period of 5.89 years, and since its rediscovery has been observed at every return except those of 1863, 1880, and 1903. It was detected by Thiele at Bergedorf on April 4 as an object of the sixteenth magnitude. Its perihelion passage occurred on September 1. Comet Tempel II was discovered by Tempel at Milan in 1873. Its period is 5.28 years. It was seen again in 1878, 1894, 1899, and 1904, but was not detected in 1883, 1889, or 1910 on account of its unfavorable position at each of these returns. Its return this year was first observed by Delavan at La Plata on May 16. It passed through perihelion on April 13. The comet discovered by Swift in 1889, with a period of about 9 years, was due to make its third reappearance, but as it had not been seen since its discovery, it was scarcely expected that it would be found this year.

Three new comets were discovered. These were designated 1915a, 1915d, and 1915e, respectively. The first two were found by Mellish at Madison, Wisconsin, the former on February 9, the latter on September 13. Comet 1915a was of the 11th magnitude at discovery, and presented the appearance of a circular nebulosity with vague boundaries. It had a very small nucleus excentric toward the sun, and a short fan-shaped tail. About the end of April it became visible to the naked eye, and attained its maximum brightness about the beginning of June. In May disintegration apparently set in, subsidiary nuclei being thrown off by the principal nucleus. Perihelion passage took place on July 25, its distance then being 110,000,000 miles. It was nearest to the earth about October 26, when it was at a distance of 47,000,000 miles. Comet 1915d passed through perihelion on October 13. Comet 1915e was discovered by Taylor at the Cape of Good Hope on December 2, but details concerning its magnitude, etc., were lacking at the end of the year. An object discovered at Harvard University by Miss Leavitt in February, and at first announced as Metcalf's comet, proved to be the minor planet 393 Lampetia.

OTHER EVENTS. The Bruce Gold Medal of the Astronomical Society of the Pacific was awarded to Prof. W. W. Campbell, director of the Lick observatory, for his distinguished services to astronomy; and Prof. Joel Stebbins, of the University of Illinois, was the recipient of the Draper Medal of the National Academy of Sciences.

BOOKS. Among the more important books on astronomy published during 1915 may be men-

tioned: *Tychonis Brahe Dani Opera Omnia*, vol. ii, edited by J. L. E. Dreyer; and W. V. Ball, *Reminiscences and Letters of Sir Robert Ball*.

ATHLETICS. See under the various sports, as BASEBALL, BASKETBALL, CYCLING, BILLIARDS AND POOL, BOWLING, BOXING, etc.

ATHLETICS, TRACK AND FIELD. The European war spoiled the year 1915 so far as international competition on the track and field was concerned. In the United States, however, this particular branch of sport thrived and several new records were established.

The most notable performance of the year was that of Norman S. Taber, who once wore the colors of Brown and Oxford universities. Taber ran the mile on the Harvard Stadium track at Cambridge, Mass., on July 16th, in 4 minutes, 12¾ seconds, the occasion being the try-outs for the national championships held in connection with the Panama-Pacific Exposition at San Francisco. The best previous figure for the mile was that set by W. G. George, a professional of Lillie Bridge, England, on Aug. 23, 1886. George's time was 4 minutes, 12¾ seconds.

George H. Goulding, of Toronto, Canada, also distinguished himself by walking seven miles in 50 minutes, 40¾ seconds, a new world's record. This feat was performed at New Brunswick, N. J., on October 23rd. E. E. Merrill up to this time held the record, having covered the same distance at Boston, Mass., on Oct. 5, 1880, in 54 minutes and 7 seconds.

Although Taber and Goulding deserve the highest mention, other names as well are entitled to special recognition. W. H. Meanix of the Boston A. A. established a record for the quarter-mile low hurdles at the Harvard Stadium in Cambridge, Mass., on July 16th, running the distance in 54¾ seconds.

Fred W. Kelly of the University of Southern California, tied the record for the 220-yard low hurdles, 24¾ seconds. Thomas J. Halpin of the Boston A. A. set a new mark of 1 minute, 13¾ seconds for the 600-yard run at the indoor national championships held at Madison Square Garden, New York, on March 2nd. Alvah T. Meyer of the Irish-American A. C. at the same time and place ran 300 yards in 32½ seconds.

The efforts of the officials of the Amateur Athletic Union to remove from its ranks those who commercialized their athletic skill were rewarded when Abel R. Kiviat of the Irish-American Athletic Club, New York, and Harry J. Smith of the Bronx Church House, New York, were convicted on charges of professionalism and barred from amateur competition for all time.

The National A. A. U. senior championships were contested at San Francisco on August 7th, during the Panama-Pacific Exposition. The Olympic Club of San Francisco won the team championship with a score of 30. The Irish-American A. C. of New York City finished second with 24 and the Illinois A. C. of Chicago third with 21.

Other clubs to score points were: Chicago A. A. 17; Boston A. A. 16; Kansas City A. C. 13; University of Wisconsin 11; Los Angeles A. C. 10; Multnomah A. C. 10; New York A. C. 9; University of Chicago 7; Salem-Crescent A. C. 7; Mohawk A. C. 5; Meadowbrook Club 5; University of Missouri 4; Caledonian Club 4; Boston Irish-American A. C. 3; Brigham Young

University 3; Notre Dame University 3; Long Island A. C. 3; Young Men's Gymnastic Club 2; Millrose A. A. 1.

In the junior championships also held at San Francisco, the Olympic Club was again a victor, scoring a total of 28 points. The Chicago A. A. was second with 27 points and the Los Angeles A. C. third with 24. Other scores were: New Orleans Association 21; New York A. C. 14; University of Notre Dame 11; Caledonian Club 10; Cincinnati Chamber of Commerce 10; Denver A. C. 8; Brigham Young University 8; Multnomah A. C. 6; Salem-Crescent A. C. 5; University of Chicago 5; Rock Island High School 5; Illinois A. C. 4; Millrose A. A. 3; Pittsburgh A. C. 2; Mississippi Agricultural Club 1.

The fortieth annual track and field meet of the Intercollegiate Association of Amateur Athletes of America was held at Franklin Field, Philadelphia, Penn., on May 28th and 29th. Cornell won the championship with a total point score of 45½. Harvard finished second with 26 and Yale third with 25. The standing of the other colleges was: Pennsylvania 21; Princeton 21; Dartmouth 14; Michigan 14; Columbia 10; Maine 9; Penn State 6; Johns Hopkins 1½; Massachusetts School of Technology 1; Bowdoin 1.

The University of Wisconsin won the annual games of the conference colleges of the Middle West with a total of 38 points. Chicago was second with 37 and Missouri third with 21. Other scores were: Illinois 18; Notre Dame 11; De Pauw 9; Northwestern 7; Lake Forest 5; Minnesota 4; Coe 3½; Ames 3; Ohio State 3; Iowa 2½; Kansas 1; South Dakota 1.

Madison Square Garden was the scene of the first indoor intercollegiate championships, Cornell making the best all-round showing of the teams entered. Alma Richards of Cornell set a new intercollegiate mark for the high jump with a leap of 6 feet 4 inches.

In the college relay races held at Philadelphia, Princeton won the two-mile event, making a new record of 7 minutes 55½ seconds. Other victors were: One mile, freshmen, Yale; one-mile, preparatory schools, Mercersburg; one-mile, high schools, Washington Central; one-mile, colleges, Pennsylvania; four-mile, colleges, Cornell.

Frederick W. Rubien, secretary-treasurer of the Amateur Athletic Union, made the following selections for All-America athletic teams:

All-America Athletic Team—100-yard dash, Joseph Loomis, Chicago A. A.; 220-yard dash, R. F. Morse, Salem-Crescent A. C.; 440-yard run, J. E. (Ted) Meredith, Meadowbrook A. C.; 880-yard run, LeRoy Campbell, University of Chicago; 1-mile run, Norman S. Taber, Boston A. A.; 2-mile run, Joie Ray, Illinois A. C.; 5-mile run, Hannes Kolehmainen, Irish-American A. C.; 10-mile run, Hannes Kolehmainen; cross-country running, Hannes Kolehmainen; 120-yard high hurdles, F. W. Kelly, Los Angeles A. C.; 220-yard low hurdles, F. Murray, Olympic Club, San Francisco; 440-yard hurdles, W. H. Meanix, Boston A. A.; walking, Edward Renz, Mohawk A. C.; marathon running, H. Honohan, New York A. C.; standing broad jump, W. H. Taylor, Illinois A. C.; running broad jump, H. F. Worthington, Boston A. A.; standing high jump, W. H. Taylor, Illinois A. C.; running high jump, W. M. Oler, Jr., New

York A. C.; three standing broad jumps, P. Adams, New York A. C.; throwing the discus, A. W. Mucks, University of Wisconsin; running hop, step and jump, D. J. Ahearn, Illinois A. C.; pole vault, S. Bellah, Multnomah A. C., Portland, Oreg.; putting 16-pound shot, P. J. McDonald, Irish-American A. C.; putting 56-pound weight for distance, M. McGrath, Irish-American A. C.; throwing 16-pound hammer, P. Ryan, Irish-American A. C.; throwing the javelin, G. A. Bronder, Jr., Irish-American A. C.; decathlon, Alma W. Richards, Cornell University.

All-America College Team—100-yard dash, H. L. Smith, University of Michigan; 220-yard dash, A. E. Ward, University of Chicago; 440-yard run, J. E. (Ted) Meredith, University of Pennsylvania; 880-yard run, LeRoy Campbell, University of Chicago; 1-mile run, I. D. Mackenzie, Princeton University; 2-mile run, D. F. Potter, Cornell University; 120-yard high hurdles, F. W. Kelly, University of Southern California; 220-yard low hurdles, F. Murray, Leland Stanford University; running high jump, W. M. Oler, Jr., Yale University; running broad jump, H. T. Worthington, Dartmouth University; pole vault, F. K. Foss, Cornell University; putting 16-pound shot, A. W. Mucks, University of Wisconsin; throwing 16-pound hammer, H. P. Bailey, University of Maine; cross-country running, J. W. Overton, Yale University.

ATKINSON, REV. EDWARD. English scholar, died March 1, 1915. He was born in 1819; educated at Cambridge; and ordained to the priesthood in 1844. In 1856 he was appointed master of Clare College, Cambridge, and continued to hold this post until his death. This tenure of the headship of a college is the longest on record at Cambridge. Although Dr. Atkinson's specialty was the classics, he was also an excellent German scholar, and was familiar with Dutch, Italian, and Anglo-Saxon. He was deeply interested in missionary work, and did much to further it.

AUBERT, MARIE JACQUES CHARLES. French admiral, died June 8, 1915. He was born in 1848, and entered the navy in 1864. After serving in various capacities until 1905, he was appointed chief of the general staff of the navy. This appointment he retained until 1909 when the Clemenceau administration was overthrown as a result of an investigation into naval shortcomings. In October of that same year he was appointed commander-in-chief of the second battalion. Two years later he became inspector of navy training establishments and shortly afterwards he returned to his old post as chief of the general staff. He reached the age limit for active service in 1913, but at the outbreak of the war in Europe returned by special request. At the time of his death he held the rank of vice-admiral.

AUCKLAND ISLANDS. A dependency of New Zealand (q.v.).

AUDION LAMP. See WIRELESS TELEGRAPHY AND TELEPHONY.

AURORA BOREALIS. See METEOROLOGY.

AUSTRALIA, COMMONWEALTH OF. A self-governing dominion of the British Empire, consisting of six original states and two territories. The temporary seat of the Federal government is Melbourne, in Victoria; the permanent capital will be Canberra, founded 1913, in the

Federal Capital Territory, which lies within the State of New South Wales.

AREA AND POPULATION. In the table below are shown by states and territories the estimated area and the population according to the census of April 3, 1911, compared with the population as estimated June 30, 1914:

	Squares miles	Population	
		1911	1914
New South Wales...	309,460	1,646,734	1,855,561
Victoria	87,884	1,315,551	1,421,985
Queensland	670,500	605,813	678,864
South Australia	380,070	408,558	438,173
Western Australia ..	975,920	282,114	323,952
Tasmania	26,215	191,211	196,758
Northern Territory ..	523,620	3,310	3,664
Federal Capital Ter..	912	1,714	2,868
Commonwealth ...	2,974,581	4,455,005	4,921,825

The population figures are exclusive of full-blooded aborigines. Their number is not known, as many of them live in the unexplored interior; but it is believed that they do not exceed 100,000. Full-blooded aborigines in the employ or within the settlements of whites numbered 19,939 at the 1911 census.

Of the total population in 1911, males numbered 2,313,035 and females 2,141,970. Persons born in Australia numbered 3,667,670; United Kingdom 590,722; other European countries, 73,949; New Zealand, 31,868; Asia, 36,442; America, 11,278; Africa, 4958; Polynesia, 3410; at sea, 4238; unspecified, 30,470. Unmarried males and unmarried females in 1911 numbered 1,506,877 and 1,276,666 respectively; married, 735,849 and 733,773; widowed, 63,675 and 128,068; divorced, 2360 and 2140; not stated, 4274 and 1323.

By occupation the population was thus classified in 1911: professional, 91,638 males and 52,973 females; domestic, 48,235 and 153,131; commercial, 236,499 and 50,188; transport and communication, 152,554 and 4837; industrial, 453,743 and 108,594; primary producers, 570,268 and 15,880; independent, 13,939 and 9116; dependents, 706,773 and 1,743,213; unspecified, 30,386 and 4038.

A feature of the distribution of population in Australia is the excessive tendency to accumulate in towns, especially in the capital cities. In 1911, the aggregate metropolitan population (i.e. the population of the state capitals with suburbs) was 1,694,329, or 38.05 per cent of the total population of the Commonwealth; as estimated for Dec. 31, 1912, 1,823,900, or 38.53 per cent. The capital of New South Wales is Sydney, which with suburbs had in 1911 629,503 inhabitants; capital of Victoria, Melbourne, 588,971; of Queensland, Brisbane, 139,480; of South Australia, Adelaide, 189,646; of Western Australia, Perth, 106,792; of Tasmania, Hobart, 39,937. The capital of the Northern Territory is Darwin, with 958 inhabitants in 1911. Population of the larger cities and towns at the 1911 census (the figures are for the "localities" named, in which case no clearly defined boundaries exist, but the figures represent the persons who returned themselves as belonging to the specified localities): Sydney, N. S. W., 107,133; Adelaide, S. A., 32,981; Ballarat, Vic., 38,686; Balmain, N. S. W., 31,961; South Brisbane, Qld., 21,332; Broken Hill, N. S. W., 30,953; Brunswick, Vic., 32,202; Carlton, Vic., 27,476; Collingwood, Vic., 20,254;

Fitzroy, Vic., 34,141; Footscray, Vic., 21,933; Geelong, Vic., 21,630; Glebe, N. S. W., 21,444; Hawthorn, Vic., 24,353; Hobart, Tas., 27,505; Launceston, Tas., 20,937; Leichhardt, N. S. W., 24,139; Marrickville, N. S. W., 25,993; Melbourne, Vic., 38,293; South Melbourne, Vic., 46,016; Newtown, N. S. W., 26,427; Paddington, N. S. W., 24,150; Perth, W. A., 31,300; Petersham, N. S. W., 20,407; Prahran, Vic., 25,489; Redfern, N. S. W., 24,275; Richmond, Vic., 38,559; St. Kilda, Vic., 25,449; North Sydney, N. S. W., 32,764; North Melbourne, 17,750; Brisbane, Qld., 17,715; Northcote, Vic., 17,491; Bendigo, Vic., 17,883; Toowoomba, Qld., 16,160.

Mean annual increase of population in the Commonwealth from 1881 to 1886, 3.86 per cent; from 1886 to 1891, 3.06; from 1891 to 1896, 1.86; from 1896 to 1901, 1.49; from 1901 to 1906, 1.38; from 1906 to 1911, 2.03; 1911 to 1912, 3.44.

Marriages, births, and deaths respectively in 1913: New South Wales, 16,307, 52,186, and 19,699; Victoria, 11,324, 35,970, and 15,474; Queensland, 5655, 19,731, and 6783; South Australia, 4094, 12,627, and 4693; Western Australia, 2572, 9218, and 2934; Tasmania, 1620, 5886, and 2131; Northern Territory, 16, 52, and 64; Federal Capital Territory, 6, 44, and 11; Commonwealth, 41,594, 135,714, and 51,789. In 1912, marriages numbered 42,147 (the highest ever recorded), births 133,088, and deaths 52,177.

Arrivals in the Commonwealth in 1913, 141,806; departures, 87,131.

RELIGION AND EDUCATION. The 1911 census made the following returns of the population classified as to religion: Christian, 4,274,414; non-Christian, 36,785; indefinite, 14,673; no religion, 10,016; object to state, 83,003; unspecified, 36,114. The Church of England had 1,710,443 adherents; Roman Catholics numbered 921,425; Presbyterians, 558,336; Methodists, 547,806; Baptists, 97,074; Congregationalists, 74,046; Lutherans, 72,395.

Persons of five years of age and upwards in 1911 numbered 4,019,372; of these, 139,749 were not able to read, and 95,727 were not recorded as to literacy.

The number of state, or public, schools, teachers, pupils enrolled, and the average attendance were as follows in 1912:

	Schools	Teachers	Pupils	Av. At.
N. S. W.	3,234	6,454	235,803	171,028
Vic.	2,178	5,567	209,209	154,410
Qld.	2,992	2,992	95,641	77,885
S. A.	768	1,473	58,273	40,838
W. A.	536	1,189	38,184	32,959
Tas.	396	840	25,368	19,561
N. Ter.	3	3	98	71
Total	8,398	18,518	662,576	496,252

In 1911, the enrollment was 633,850, and the average attendance 463,799. Statistics of private schools in 1912:

	Schools	Teachers	Pupils	Av. At.
N. S. W.	754	3,673	61,744	51,168
Vic.	548	1,856	56,035	45,000
Qld.	151	767	17,289	14,752
S. A.	174	681	12,031	9,430
W. A.	118	427	10,000	8,506
Tas.	116	360	6,933	5,041
N. Ter.	1	2	53	43
Total	1,862	7,766	164,085	133,940

In 1911, the enrollment in private schools was 160,794, and the average attendance 132,588.

PRODUCTION. The estimated value of the products of the Commonwealth in 1912 were as follows: agricultural, £45,754,000; pastoral, £51,615,000; dairying, etc., £20,280,000; forests and fisheries, £6,432,000; mining, £25,629,000; manufactures, £57,022,000. The estimated area under cultivation in 1912-13 was 17,368,000 acres, as compared with 16,642,000 acres in 1911-12. For some of the principal crops, the area harvested, in thousands of hectares, and the yield, in metric tons, are reported as follows:

	1,000 Hectares		Metric Tons	
	1912-13	1913-14	1912-13	1913-14
Wheat ..	2,970	3,758	2,508,357	2,812,614
Oats	354	348	285,105	269,455
Corn	127	134	212,255	233,012
Potatoes ..	52	69	425,054	438,060
S. cane....	34	*65	1,153,357	2,308,010
Raw sugar ...			131,338	245,371

* Productive and unproductive.

The number of live stock Dec. 31, 1911, and Dec. 31, 1913, is reported as follows: horses, 2,279,027 and 2,521,983; cattle, 11,828,954 and 11,483,882; sheep, 93,003,521 and 85,057,402; goats, 280,086 and 262,272; swine, 1,110,721 and 800,505; camels, 8403 and 10,822; ostriches, 1939 and 1908. The wool production of the Commonwealth, stated as in the grease, was 648,852,000 pounds in 1913, as compared with 726,409,000 pounds in 1912.

The value of the gold production in 1913 was £9,376,573. In 1912, the total mineral production was valued at £25,629,238, the shares of the states being: New South Wales, £11,226,602; Victoria, £2,331,294; Queensland, £4,175,355; South Australia, £584,458; Western Australia, £5,700,207; Tasmania, £1,493,502; Northern Territory, £57,820. Gold production in 1912 was valued at £9,879,928; coal, £4,418,025; silver-lead bullion and ore, £3,539,532; copper, £3,244,550; zinc, £1,766,459; tin, £1,348,992; lead, £342,762; silver, £336,719.

COMMERCE. Imports, domestic exports, and total exports have been valued as follows:

	Imports	Exports	
		Domestic	Total
1910	£60,014,351	£71,836,195	£74,491,150
1911	66,967,488	76,205,210	79,482,258
1912	78,158,600	75,961,563	79,096,090
1913	79,749,653	75,138,147	78,571,769
1914	73,945,664		67,575,682

Leading imports in 1913, in thousands of pounds sterling: metal manufactures, 11,782; cotton and linen goods, 4574; woolen goods, 2146; silk goods, 1884; hats and caps, etc., 644; boots and shoes, 665; other apparel, 4477; timber, 2942; drugs, chemicals, etc., 2493; paper, 1997; spirits, 1375; arms and explosives, 953. Principal exports in 1913, in thousands of pounds sterling: wool, 26,277; hides and skins, 5546; wheat, 7987; butter, 3565; beef, 2652; gold specie, 2093; gold bullion, 972; gold in matte, 404; copper matte, ingots, ore, and bars, 2972; tallow, 2163; lead, 1848; timber, 1002; zinc concentrates, 2243; tinned meat, 1085; mutton, 1993; flour, 1864; tin ingots, 690.

Imports from and exports to the United

Kingdom in 1913 were £47,615,561 and £34,756,548 respectively; New Zealand, £2,513,934 and £2,356,990; India, £2,964,246 and £1,355,383; Belgium, £2,258,839 and £7,465,742; France, £625,397 and £9,684,362; Germany, £4,956,834 and £6,873,441; United States, £9,522,704 and £2,631,058; Japan, £918,681 and £1,429,310. By proclamation dated Sept. 7 and 8, 1914, the export of wheat and wheat flour to all countries except the United Kingdom was prohibited. Exceptions may be authorized. By proclamation of Nov. 12, 1914, the export of foodstuffs and fodder destined to foreign ports in Europe, on the Mediterranean and on the Black Sea, other than those of France, Russia (excluding Baltic ports), Spain, and Portugal was prohibited on the above date. By an order of July 7, 1915, the export of corn and oats was prohibited, except under authorization from the minister of commerce and customs.

COMMUNICATIONS. Government railway in operation June 30, 1914, is shown in the table below; the first column shows mileage, the second cost of construction and equipment (to the end of June, 1912), the third gross receipts, and the fourth working expenses for the year ended June 30, 1914:

	Miles	Const.†	Receipts	Expenses
N. S. W. ...	3,967	£55,514,903	£7,742,241	£5,409,820
Vic. ...	3,747	45,836,573	5,560,958	3,835,964
Qld. ...	4,713	27,751,227	3,680,561	2,393,395
S. A. ...	*2,168	14,927,649	2,389,200	1,545,700

N. Ter. ...	*145	1,040,702	*15,933	16,666

Total 18,226 £160,557,160 £21,976,072 £14,996,266

* To June 30, 1912. † To June 30, 1913.

Private railways in the Commonwealth in 1913 aggregated 1812 miles, of which only 960 miles were open to general traffic.

In a debate on the Kalgoorlie to Port Augusta Railway Loan Bill, the minister for home affairs stated that the East to West transcontinental line would be open for traffic by the end of 1916. Up to July 17th, between 700 and 800 miles of track had been laid out of a total of 1053 miles, and it was expected that the line would be finished by the end of 1916. Rails weighing 80 pounds per yard were used, and the scheme allowed for a speed of 30 miles per hour. In addition to the East to West and the North to South transcontinental railways there was also discussion during the year of a proposal to build a long line of railway from a point in South Australia through a portion of New South Wales and on to Queensland, chiefly for strategic and developmental purposes. This was discussed in a conference of premiers of the Australian states, and it was decided to hold a conference between the military advisers of the Commonwealth and the railway commissioners of the states.

From the standpoint of defense as well as from considerations of railway development the question of the unification of the railway gauges of Australia was an important consideration in 1915. At a conference of state premiers, held to consider this subject, it was decided that a commission of two railway experts of high reputation, preferably from outside Australia, should be appointed to consider this matter

from all points of view. These commissioners would be asked to advise upon the need of a uniform gauge, the most suitable gauge in view of the present circumstances and future prospects, the best method of carrying out unification, the benefits that will accrue to the states, and the probable cost. An interesting feature of the proposal was that one expert should be brought from the United States and one from Great Britain.

FINANCE. Commonwealth revenue and expenditure, respectively, have been as follows: in 1911-12, £20,548,520 and £20,548,520 (including payments to the states amounting to £5,824,423); in 1912-13, £21,907,084 and £21,907,084 (£8,119,930); in 1913-14, £21,740,423 and £21,740,423 (£6,282,999); in 1914-15 (estimate), £23,273,000 and £36,361,314 (£6,418,750). Estimated customs revenue in 1914-15, £11,702,000; estimated expenditure for defense and the fleet, £16,069,005. On June 30, 1913, the aggregate public debts of the states amounted to about £277,100,000, against which there were sinking funds of £5,700,000.

ARMY. The Commonwealth of Australia normally maintains a citizen army providing for universal training. This involves a certain number of men permanently employed, and land forces, which include senior cadets and rifle clubs, the whole being embraced in a comprehensive scheme for universal service. For some time after the federation in 1901, the military forces of Australia had been brought under a single control and reorganized, but it was found difficult to maintain interest in recruiting, and after a visit of inspection by Lord Kitchener in 1910 a scheme of compulsory training for the military or naval service, specifically for home defense, was adopted. No man was to be subject to foreign service unless he voluntarily enlisted therefor, and the various expeditions that left Australia in 1914 and 1915 were composed entirely of volunteers. The basis of military organization of the Commonwealth is that the troops of each of the six States shall be under the control and direction of a district commandant who is responsible to the minister of defense, and the Military Board at military headquarters. Each State is divided into training areas, in each of which is an area officer, who is assisted by one or two non-commissioned officers of the permanent and instructional staff. This system of universal service gradually became popular, and in but few cases were legal penalties required for shirkers, as public sentiment made evasion of military duty very unpopular.

In 1914 and 1915, however, the great European war required that Australia, like the other British colonies, should furnish its share of men, and an expeditionary force of 20,000 was raised in 1914, at the expense entirely of Australia, and a further force of 10,000 additional volunteers was sent soon after. The first convoy consisted of a division including a staff, three brigades, divisional troops, and one light horse brigade; and the second convoy consisted of line and communication troops, as reinforcement, two additional light horse brigades, one additional infantry brigade, and certain volunteer units. These forces, together with an expeditionary force from New Zealand, left Australia in November, 1914, and were disembarked at Cairo for the defense of Egypt. There a large camp,

with all conveniences, was established near the Pyramids, and the troops went into an elaborate course of training which included maneuvers by the various units. At the end of February it was reported that 39,000 troops had been sent out, as follows: Infantry, 600 officers, 19,000 men; cavalry, 320 officers, 70,000 men; artillery, 120 officers, 3400 men; engineers, 21 officers, 600 men; signal troops, 7 officers, 2100 men; line of communication, etc., 1800 officers, 4900 men. An offer of 10,000 additional troops to be sent in April was presented to the British war office, and further reinforcements were contemplated during the year. The cost of Australia's participation in the war up to June 30 was estimated at \$65,000,000. Up to Sept. 29, 1915, the Australian defense department reported that 63,357 men had been sent over seas, and that there were in addition a like number in training.

GOVERNMENT. Australia is a Federal Commonwealth within the British Empire. The executive authority rests in the sovereign acting through a Governor-General whom the sovereign appoints. The Governor-General is aided by a Federal executive council of seven ministers and certain honorary ministers. The legislative power is exercised by a Federal Parliament of two houses, the Senate and the House of Representatives. Senators are 36 in number (six from each state) elected for six years by universal suffrage. Representatives are elected by universal suffrage for three years. For the period 1913-16 the House is composed of 27 members for New South Wales, 21 for Victoria, 10 for Queensland, 7 for South Australia, 5 for Western Australia, and 5 for Tasmania. Governor-General in 1915 (from May, 1914) Ronald Cranford Munro-Ferguson.

The new cabinet which was formed Oct. 27, 1915, was constituted as follows: Premier and attorney-general, William M. Hughes; defense, Pearce; trade and customs, Tudor; external affairs, Mahon; navy, Jensen; home affairs, O'Malley; treasury, Higgs; postmaster-general, Webster; vice-president of the executive council, Gardiner; honorary minister, Russell.

HISTORY

INTERNAL CONDITIONS. The most noticeable fact in the history of Australia during the year was the increase in the enthusiasm with which the people supported the cause of the British Empire in the war. No more convincing evidence of loyalty could have been given than the increase in the number of recruits enlisting for active service in the army and navy. Furthermore, Australia began to furnish munitions to Great Britain, to take measures to injure German trade in the East, and to maintain an active interest and enthusiasm in the conflict. The different sections of the country were brought closer together in policy; everywhere the people manifested a desire in one way or another to be of service to the Allies. The depletion of the number of men in the country, caused by the recruiting for the war, brought about a serious economic crisis. The wheat crop, one of the mainstays of the Commonwealth, fell off until by July Australia had been compelled to import 1,800,000 bushels from the rest of the world and was badly in need of 10,000,000 additional bushels instead of the usual

exportation of 30,000,000 to 60,000,000 bushels. This state of affairs led the Australian government to take every effort to increase the wheat yield per acre in order to supply the mills of the country and the demand from the rest of the world. The exportation of great numbers of cattle to the United States and other countries also threatened a serious handicap to Australians. The increased demands from the Allies for food supplies and the smaller numbers of animals than usual in the country made it imperative that some action be taken in the matter. The suggestion that the exportation of cattle to any country other than England, France, Russia, or Italy be prohibited brought about a storm of protest and was not enacted into law. Early in January the Commonwealth withdrew its order prohibiting the exportation of wool to the United States. All exporters were compelled to guarantee, however, that this wool would not be re-exported after it reached America. The prohibition order was passed shortly after the beginning of the war in 1914 when it was found that Germany was purchasing from America some of the wool which originally had been sold out of Australia. In February the Federal Government of Australia, in accordance with a request from Great Britain, passed a bill authorizing such measures as might be necessary in order to obtain all the meat obtainable for exportation to Great Britain and the allied countries during the war. Under the provisions of this act the government discouraged the export of meat products to neutral countries. In September the Board of Trade of London announced that the British government with the hearty coöperation of Australia and New Zealand had purchased the entire control of frozen meat products in Australasia at a cost of \$250,000,000 a year. Food prices rose so high during the early part of the year and without apparent cause that the government in April began to take means to prevent a further increase. It also went into the business of exporting sheep, hogs, and cattle to the Allies, leaving the middleman out of the transaction. Late in April reports were current that Australia had expressed its willingness to relieve the Imperial government of the administration of Fiji.

ANTI-GERMAN SENTIMENT. The enthusiasm which Australia developed for the cause of the Allies brought about a counter feeling against the Germans and German trade in the East. This anti-German feeling in January compelled Herman Homberg, for six years attorney-general of South Australia, to resign. In August Atty-Gen. William H. Hughes made sensational charges that German companies with ramifications in the United States and Great Britain were controlling the metal trade of the Commonwealth and that this control hampered the output of munitions and the prosecution of the war. Attorney-General Hughes also alleged that the Australian metal companies by not annulling their contracts with these German firms passively assisted the enemies of Great Britain. His charges created a great sensation in Parliament and in the country at large and resulted in the suggestion that an Australian metal exchange be created, and that no one be permitted to purchase Australian metals or metallic products unless he was pro-British. Further charges were made that the American companies

buying Australian zinc and copper were financed by German capitalists.

FINANCIAL AFFAIRS. At the reassembling of Parliament in April Prime Minister Arthur Fisher stated that £3,500,000 would be needed for extra expenses of the troops, but that the Imperial government had agreed to lend £6,500,000 in addition to the £18,000,000 for which the Commonwealth was already indebted. This made a debt of £24,500,000 and it was understood that this soon would be increased to £33,000,000. On July 7th Prime Minister Fisher announced that a loan would be negotiated shortly by the government, and one week later a bill was introduced in the House of Representatives calling for a local loan of £20,000,000 at 4½ per cent interest. Both Houses of Parliament passed the bill on July 23rd. Prime Minister Fisher stated at the same time that the war to the last of June had cost the Commonwealth £3,000,000 sterling, that the Imperial government had furnished £15,500,000 and would soon lend an additional £9,000,000. In August the premier estimated a deficit of £50,500,000 in the revenues of the country, of which £34,000,000 would be met by various loans. The government decided to impose a heavy income tax on all incomes exceeding \$760, and expected by means of this additional tax to raise at least £4,000,000.

AUSTRALIA AND THE WAR. Late in December, 1914, Australia sent her second expeditionary force of 25,000 men to Europe to aid the cause of the Allies. The third force of 20,000 men was being recruited at the time in readiness for a call to the front. Popular sentiment responded enthusiastically to the demands made early in February by Senator Pearce, minister for defense, that all able-bodied men should enlist for the firing line and that all others should train at rifle clubs in order to be prepared when called upon. Speakers everywhere advocated enlistment, and promised that the government would take charge of the enlistment, training, and dispatching of forces to the front. At the opening of Parliament in April, Prime Minister Fisher accepted this responsibility on the part of the government and pleaded for more recruits. Late in April the Australian troops exhibited especial gallantry and bravery in attempting the passage of the Dardanelles, and received praise from Gen. Sir Ian Hamilton and other generals leading the British forces. This praise had the desired effect and immediately recruiting began in earnest in the Commonwealth. It was expected that Australia would soon be able to offer another 100,000 men to the Allies. Up till July the Commonwealth had furnished approximately 100,000 troops. Of this number some 2000 were killed in the fighting around the Dardanelles. In proportion to its population Australia led all the other countries in furnishing relief and benefits to the Belgians. Late in April a Belgian Flag Day was held in Melbourne, and this was followed in May by a Belgian Rose Day at which King Albert's birthday was celebrated. The proceeds of these two entertainments amounted to \$80,000. New South Wales, not to be outdone, appointed May 14th as a Belgian Day, and turned the state, particularly the city of Sydney, into a great fair. Almost \$500,000 was raised for the relief of Belgium, of which sum Sydney alone contributed \$100,000.

AUSTRALIA

MUNITIONS FOR THE ALLIES. In June the Australian government announced that it would soon begin to turn out munitions for the Allies. Senator Pearce, minister for defense, appointed a Special Munitions Committee consisting of Capt. J. Smith of the Naval Board, Captain Thring, director of naval ordnance, Colonel Dangar, chief of ordnance, M. Bell, chemical adviser of the Department of Ordnance, and S. McKay, a partner in the Sunshine Harvester Works. The object of this committee was to bring about coöperation between the committees appointed by the large commercial corporations throughout the country. The committee also was formed to consider the supply of munitions material to the Commonwealth by the Australian manufacturers, government manufacture of war materials, and contracts between the War Office and Australian manufacturers. Much criticism had been directed at Minister Pearce for his failure up till this time to aid the Allies by the manufacture of war munitions, but the minister produced evidence to show that the delay had been caused by a misunderstanding as to the quality of the steel and the size of the munitions to be manufactured. As early as September, 1914, Australia had offered to supply ammunition for eighteen-pounders, but Great Britain had not at that time accepted the Commonwealth's offer. In the month of September the entire membership of the House of Representatives, the lower legislative body of the Federal Parliament, pledged itself never again during the war to buy German products.

CABINET CHANGE. Late in October the Commonwealth prime minister, Mr. Andrew Fisher, resigned his position at the head of the Australian Cabinet in order to become Australian High Commissioner in London. He was succeeded by Mr. William M. Hughes, who continued at the same time to hold his former position of Attorney-General in addition to his new position as Premier. The membership of the new cabinet, October 27th, will be found above, given under the section *Government*. Mr. Hughes announced that his government would continue to support the mother-country with all possible vigor.

AUSTRIA-HUNGARY, or THE AUSTRO-HUNGARIAN MONARCHY. A central European monarchy, consisting of the Austrian empire, the Hungarian kingdom, and the territory of Bosnia and the Herzegovina. Vienna is the capital of Austria and the permanent residence of the sovereign; Budapest is the capital of Hungary. In these cities the common legislature (the delegations) convenes alternately.

AREA AND POPULATION. In the table below are shown the area and the population of Austria by crown-lands, of Hungary proper, of Croatia and Slavonia, of Bosnia, and of the Herzegovina. The population figures are those returned by the most recent censuses—for Austria and the Hungarian kingdom, the censuses of Dec. 31, 1900, and Dec. 31, 1910; for Bosnia and the Herzegovina, the censuses of April 22, 1895, and Oct. 10, 1910. As the censuses for Bosnia and the Herzegovina did not coincide with those for the main part of the monarchy, the totals shown below can be regarded as only approximate. Bosnia and the Herzegovina were not annexed until Oct. 5, 1908; hence, the population of the monarchy as constituted in 1900 was 45,405,267.

66

AUSTRIA-HUNGARY

	Square miles	Population 1900	Population 1910
Bohemia	20,057	6,318,697	6,769,548

Monarchy	261,241	46,996,303	51,390,223

* Census of April 22, 1905. † Census of Oct. 10, 1910.

Transylvania, with an area of 22,318 square miles, is sometimes not regarded as a part of Hungary proper, as so much of its population is non-Magyar—in 1910, the vernacular of 55.0 per cent of the people was Rumanian and of 8.7 per cent German; the total population of Transylvania in 1900 was 2,476,998 and in 1910, 2,678,367. The 1910 census returned the population, according to vernacular, of Austria and of Hungary proper (including Transylvania) as follows:

	Austria		Hungary	
	No.	Per cent	No.	Per cent
German	9,950,266	35.58	1,908,357	10.40
Magyar	10,974	.04	9,944,627	54.50
Bohemian, Moravian, Slovak	6,435,983	23.02		
Slovak			1,946,357	10.70
Polish	4,967,984	17.77		
Ruthenian	8,518,854	12.58	464,270	2.50
Serbian and Croatian	783,334	2.80	656,324	3.60
Rumanian	275,150	0.98	2,948,186	16.10
Slovene	1,252,940	4.48		
Italian and Ladin	768,422	2.75		
Other*	608,062		401,412	2.20
Total	28,571,934		18,264,538	

* Including, in Austria, foreigners, of whom about 800,000 Magyars.

The 1910 returns for Croatia and Slavonia, not included above, are: Croatian, 1,638,854 (62.5 per cent); Serbian, 644,955 (24.6); German, 134,078 (5.1); Magyar, 105,948 (4.1); Slovak, 21,613 (0.8); Ruthenian, 8307 (0.3); Rumanian, 846; other, 67,843 (2.6). The population of the monarchy in 1910, exclusive of the military in Bosnia and the Herzegovina, was 51,356,465; of this number, persons whose vernacular was German were returned at 12,010,669; Magyar, 10,067,992; Bohemian, Moravian,

or Slovak, 8,475,292; Croatian or Serbian, 5,545,531; Polish, 5,019,496; Rumanian, 3,224,755; Italian and Latin, 804,271; other, 860,365 (including foreigners in Austria to the number of 608,062); total, 51,356,465.

The population according to religion in 1910 is shown in the table below (exclusive of the military in Bosnia and the Herzegovina): Roman Catholics, *R.C.*; Greek and Armenia Catholics, *G.A.*; Orthodox (adherents of the Eastern Church), *Orth.*; Evangelicals of the Augsburg Confession, *Augs.*; Evangelicals of the Helvetian Confession, *Helv.*; Mohammedans, *Moh.*:

	<i>Austria</i>	<i>Hung.</i>	<i>Bos.-Herz.</i>	<i>Monarchy</i>
R. C.	22,530,169	10,888,138	434,061	33,852,368

	1912	16,328	81,994	178	48,416

* Exclusive of still-births.

The table below shows the emigration from the monarchy, the share therein of Austria, and the number bound for the United States and Canada.

	<i>Aus.-Hun.</i>	<i>Austria</i>	<i>To U. S.</i>	<i>To Can.</i>
1909	250,580	129,808	170,191	10,916
1910	270,060	138,915	258,737	9,769
1911	163,962	91,868	159,057	12,105
1912	247,466	131,227	178,882	24,394
1913	309,950	194,462		

Immigration is reported as follows: in 1909, 49,413; in 1910, 47,290; in 1911, 86,342; in 1912, 88,560.

EDUCATION. In both Austria and Hungary elementary education is free and compulsory. In Austria, children of school age numbered 4,885,504 in 1911, and 4,947,724 in 1912. The table below shows, for Austria, comparative educational statistics in 1911 and 1912: A, institutions for higher instruction, including the universities, technical high schools, theological seminaries, etc.; B, middle schools, including the gymnasia, realschulen, etc.; C, special public and private schools, including commercial and industrial schools, etc.; D, public and private elementary and grammar schools. The more important details, included in the foregoing classifications, are: E, universities; F, technical high schools; G, theological seminaries; H, gymnasia and realgymnasia for boys; I, gymnasia for girls; J, realschulen and lyceums for girls; K, commercial schools; L, industrial schools; M, agricultural and forestry schools; N, private elementary and grammar schools.

The teachers and students respectively at each of the seven government technical high schools, in Austria, were as follows in the win-

ter semester of 1913-14: Vienna, 183 and 3177; Prague (German), 86 and 900; Prague (Bohemian), 151 and 2817; Graz, 54 and 817; Brünn (German), 102 and 924; Brünn (Bohemian), 73 and 569; Lemberg, 98 and 1791; in addition, the Vienna agricultural high school had 86 teachers and 1135 students. The Austrian government maintains 8 universities; teachers and students in the winter semester of 1913-14: Vienna (German), 666 and 10,310; Prague (German), 225 and 2282; Prague (Bohemian), 249 and 4713; Graz (German), 199 and 2203; Innsbruck (German), 139 and 1480; Czernowitz (German), 61 and 1194; Lemberg (Polish), 186 and 5871; Cracow (Polish), 195 and 3344. Of the total university students, about 8.5 per cent were women.

In Hungary, children of school age in 1912 numbered 3,548,365. There were 19,521 public primary schools, with 49,150 teachers and 2,969,444 pupils. Students at public middle schools numbered 86,378, and at higher city schools 98,125. Training colleges numbered 90, with 1229 teachers and 10,340 students; gymnasias, 192, with 371 teachers and 66,863 students; realschulen, 43, with 1044 teachers and 14,938 students. There are many special and professional schools. The technical high school at Budapest had 169 teachers and 1868 students. The Hungarian government maintains 5 universities: Budapest, with 412 teachers and 6962 students in 1912; Zágráb (Agram), 97 and 1096; Kolozsvár (Klausenburg), 137 and 2157; Debreczen and Pozsony (Pressburg), the last two founded in 1912. Theological seminaries numbered 47 (of which 29 Roman Catholic), with a total of 296 professors and 2007 students.

AGRICULTURE. The crops include all the common European products, while among those of the southern part of the monarchy are various sub-tropical fruits and plants. Of the total area, arable land constitutes about 35.37 per cent in Austria and 42.82 per cent in Hungary; gardens, 1.26 and 1.32; vineyards, 0.74 and 0.95; meadows, pastures, etc., 23.90 and 12.24; woodland, 32.63 and 27.41; lakes, marsh, etc., 0.35 and 0.20; unproductive (untaxed), 5.63 and 5.24. Among the leading agricultural products are cereals, potatoes, and other vegetables, sugar beets, fruits, flax, hops (in Bohemia), tobacco (especially in Hungary), and hay. The average yield of wheat during the years 1905 to 1914 is stated at about 16,072,000 metric quintals in Austria and 46,072,000 in Hungary; rye, 26,763,000 and 12,759,000; barley, 16,322,000 and 15,070,000; oats, 22,828,000 and 12,733,000; corn, 3,988,000 and 45,330,000; potatoes, 132,848,000 and 52,864,000; sugar beets, 63,871,000 and 30,353,000; wine, 4,776,000 and 4,481,000 hectolitres; hops, 135,560 and 9530 metric quintals; tobacco, 66,950 and 676,350; linseed, 236,700 and 58,000; flax fibre, 349,300 and 130,600; hemp seed, 134,500 and 230,900; hemp fibre, 176,600 and 590,000; rape seed, 246,800 and 216,000; silk cocoons, 2,214,000 and 1,767,000 kilograms. Area (in hectares) and yield (in metric quintals) as estimated for some of the important crops:

	Hectares		Quintals	
	1913	1914	1913	1914
Austria:				
Wheat	1,212,892		16,227,547	
Rye	4,935,425		93,451,550	

	Hectares		Quintals	
	1913	1914	1913	1914

In Hungary proper, the number of horses at the end of April, 1913, is stated at 2,005,019; asses, 16,157; mules, 905; cattle, 6,045,184; buffaloes, 161,683; goats, 268,752; swine, 6,824,657.

MINING AND METALS. In Austria, the total reported value of mining products increased from 233,145,531 kronen in 1905 to 315,486,476 in 1910, 352,545,531 in 1912, and 371,442,426 in 1913. Mining products (in metric quintals) in 1912 and 1913, and their value (in kronen) in 1913, were as follows:

	Metric Quintals		Kronen
	1912	1913	1913
Coal	157,978,895	164,598,889	172,334,415
Lignite	262,836,895	273,783,324	149,472,148
Iron ore	29,266,897	30,393,241	28,886,641
Lead ore	279,515	257,511	6,133,751
Silver ore	217,935	199,368	3,865,466
Mercury ore	1,177,797	1,306,083	3,175,455
Zinc ore	346,747	342,247	2,072,820
Graphite	453,748	494,562	1,983,807
Copper ore	173,537	163,533	1,542,296
Gold ore	301,920	359,940	719,880
Total, including others	453,392,880	472,222,676	371,442,426

The output of refined or prepared salt in 1912 was 3,657,888 metric quintals, valued at 47,314,803 kronen; in 1913, 3,375,629 quintals, valued at 46,313,806 kronen. The output of petroleum (and ozocerite) in Galicia increased from 7,973,484 metric quintals in 1905 to 20,-

884,569 in 1909, and then declined to 14,897,824 in 1911, and 11,458,163 in 1912 (11,441,332 quintals petroleum, 16,831 quintals ozocerite); the 1911 output was valued at 49,608,865 kronen, while the 1912 production, though of less quantity, at 59,695,236 kronen (57,234,546 for petroleum, 2,460,690 for ozocerite).

The value of furnace products increased from 103,205,734 kronen in 1905 to 143,951,194 in 1910, 179,212,612 in 1912, and 181,607,752 in 1913. These products in 1913 included: raw iron, 17,578,642 metric quintals, valued at 143,457,727 kronen; lead, 223,116 quintals, 10,706,814 kronen; zinc, 195,084 quintals, 10,366,981 kronen; copper, 36,845 quintals, 5,986,409 kronen; silver, 54,433.5 kilos, 5,264,916 kronen; gold, 283,587 kilos, 919,773 kronen; blue vitriol, 8966 quintals, 514,970 kronen.

In Hungary, the value of mining and furnace products increased from 79,487,936 kronen in 1895 to 106,743,742 in 1900, 106,173,334 in 1905, 152,837,807 in 1910, and 160,275,593 in 1911; these figures do not include the original value of raw products which have been turned into manufactures whose values are included. The more important mining and metal products (in metric quintals) in 1910 and 1911, and their value (in kronen) in 1911, were as follows (the original value of raw products which have been turned into manufactures is included):

	Metric Quintals		Kronen
	1910	1911	1911
Lignite	77,341,659	81,545,596	77,200,431
Raw iron	5,020,558	5,184,503	43,847,926
Coal	13,021,028	12,901,822	15,480,648
Iron ore	19,057,488	19,502,309	13,334,330
Gold	*3,041	*3,194	10,469,168
Coke	1,560,480	1,451,043	4,064,000
Iron pyrites	924,643	967,545	907,000
Silver	*12,547	*10,806	907,295
Lead	20,766	15,831	502,000
Bitumen	49,935	38,609	530,000
Antimony	7,815	8,921	487,000
Mercury	900	797	319,000
Copper	2,135	2,080	286,000
* Kilograms.			

The following values are reported for Hungarian mining and furnace products in 1912: lignite, 80,697,000 kronen; raw iron, 46,447,000; coal, 16,904,000; iron ore, 15,379,000; gold, 9,354,000; silver, 1,023,000.

COMMERCE. The tables below show the trade of the common customs territory. Imports of merchandise for domestic consumption, of total merchandise, of coin and bullion, and the total imports, in thousands of kronen:

	Mdse. Home Consump.	Total Mdse.	Coin and Bullion	Total Imports
1900	1,696,358	1,748,968	44,898	1,793,866
1905	2,146,133	2,213,145	55,982	2,269,127
1910	2,852,852	2,929,734	43,101	2,972,835
1911	3,191,711	3,275,208	41,414	3,316,622
1912	3,556,797	3,669,882	19,827	3,689,709
1913	3,406,592	3,508,700	35,619	3,544,319

Exports of domestic merchandise, of total merchandise, of coin and bullion, and the total exports, in thousands of kronen:

	Domestic Mdse.	Total Mdse.	Coin and Bullion	Total Exports
1900	1,942,003	2,061,705	66,546	2,128,251
1905	2,243,780	2,390,722	59,533	2,450,255
1910	2,418,606	2,587,640	80,930	2,668,570
1911	2,404,304	2,582,560	132,915	2,715,475
1912	2,733,855	2,926,665	178,420	3,105,085
1913	2,769,688	2,987,534	107,278	3,094,812

In the special trade, classified imports and exports were valued as follows in 1912 and 1913, in thousands of kronen:

	Imports		Exports	
	1912	1913	1912	1913
Raw mate'ls.	2,006,214	1,996,629	961,320	918,875
Partially mfd.	574,775	498,831	511,130	527,723
Manufactures	975,808	911,132	1,261,405	1,328,090
Total	3,556,797	3,406,592	2,733,855	2,769,688

In 1912 and 1913 respectively, the more important imports of merchandise for consumption were valued as follows, in thousands of kronen: raw cotton, 329,785 and 336,057; coal, coke, etc., 220,905 and 262,827; wool, 161,971 and 141,478; hides and skins, 102,254 and 115,571; silk and its manufactures, 123,144 and 114,408; coffee, 102,020 and 93,390; flax, hemp, and jute, 89,935 and 85,910; corn (maize), 105,682 and 83,806; machinery, 100,399 and 80,837; eggs, 66,574 and 68,518; copper, 83,172 and 63,660; tobacco, 61,987 and 46,560; rice, 28,351 and 36,242. Leading exports of domestic produce in 1912 and 1913 respectively, in thousands of kronen: sugar, 254,076 and 292,880; sawn timber, 164,036 and 157,094; eggs, 144,152 and 137,372; rough timber, 92,073 and 90,399; glass and glassware, 77,715 and 88,264; lignite, 78,508 and 76,425; woolen goods, 70,001 and 64,809; leather gloves and shoes, 54,050 and 60,623; malt, 66,143 and 55,697; cattle, 36,457 and 44,122; hops, 49,597 and 38,826; barley, 45,819 and 33,706; metal manufactures, 47,508 and 33,593; bed feathers, 19,138 and 19,093; beer (in casks), 16,252 and 18,817; fowl, 16,177 and 15,960; horses, 32,206 and 15,489; coal, 12,800 and 14,527; beans, 19,655 and 10,868.

The special trade in merchandise by principal countries, in thousands of kronen:

	Imports		Exports	
	1912	1913	1912	1913
Germany	1,405,594	1,366,731	1,212,907	1,500,540
United States	348,575	323,333	63,887	70,236
British India	199,314	233,195	63,434	94,676

Du. E. Indies	37,718	25,765	3,433	8,032
Chile	22,359	23,314	2,328	1,956
Serbia	40,771	22,736	43,029	53,284
Greece	22,259	21,370	23,404	29,787
Total, including other	3,556,797	3,406,592	2,733,855	2,769,688

SHIPPING. There were entered at Austrian seaports in 1912 167,111 vessels, of 25,556,314 tons; in 1913, 173,511 vessels, of 27,877,722 tons (of which 161,088 vessels, of 25,445,061 tons, Austro-Hungarian). Vessels cleared at Austrian seaports in 1912, 167,122; of 25,569,882 tons; in 1913, 173,377, of 27,857,112 tons (of which 161,282 vessels, of 25,417,590 tons, Austro-Hungarian). At Hungarian (including Croatian) seaports, there were entered in 1911 37,250 vessels, of 4,664,645 tons; in 1912, 33,771 vessels, of 4,713,886 tons. Cleared in 1911, 37,210 vessels, of 4,651,998 tons; in 1912, 33,-

779, of 4,728,424 tons. The principal ports are Trieste and Fiume.

COMMUNICATIONS. As reported for the beginning of 1913, the length of railway in operation was 46,962 kilometers (29,181 miles), of which 23,200 kilometers were in Austria, 21,806 kilometers in Hungary, and 1956 kilometers in Bosnia and the Herzegovina. Most of the railway is under government operation. In 1912, there were in Austria 47,192 kilometers of telegraph lines, with 238,917 miles of wire and 7088 offices; in Hungary, in 1913, 26,388 kilometers of lines, with 160,712 kilometers of wire and 5171 offices; in Bosnia and the Herzegovina, in 1912, 3501 kilometers of line, with 10,444 kilometers of wire and 382 offices. Post offices in Austria in 1912, 10,450; in Hungary, 6610; in Bosnia and the Herzegovina, 240; in addition there were 36 Austro-Hungarian post offices in foreign territory.

FINANCE. The standard of value is gold. The monetary unit is the krone (crown), whose par value is 20.263 cents. The cost of administering the common affairs of the monarchy is borne by Austria and by Hungary in a proportion agreed to by their parliaments and sanctioned by the Emperor-King. The agreement renewed for 10 years in 1907 provides that the net proceeds of the common customs be applied to the common expenditure, and that the remaining expenditure be satisfied in the proportion of 63.6 per cent by Austria and 36.4 per cent by Hungary. The following table shows, for the common government, net expenditure (ordinary and extraordinary), net customs revenue, and the contributions of Austria and Hungary, in thousands of kronen:

	Expenditure	Customs Revenue	Contributions Austria	Hungary
1900	348,164	181,048	142,428	74,688
1905	438,070	148,630	198,748	95,392
1910	573,750	228,452	219,610	125,688
1911	553,572	222,717	210,424	120,431
1912	683,272	238,645	282,783	161,844
1913	934,989	227,669	449,856	257,464
1914*	782,819	97,252	436,021	249,546
1914-15†	778,244	216,455	357,298	204,491

* Sanctioned estimates for Jan.-June, 1914.

† Budget estimates for the year July, 1914-June, 1915.

Below are shown, for the common government, the avenues of net expenditure, in thousands of kronen (F. A., ministry for foreign affairs; A., army; N., navy; F., ministry of finance; C., high court of accounts):

	F. A.	A.	N.	F.	C.
1900	10,396	289,205	44,079	4,186	298
1905	11,770	335,618	86,055	4,316	316
1910	14,619	453,420	100,664	4,710	337
1911	15,996	411,840	120,666	4,735	335
1912	18,044	489,763	170,197	4,926	342
1913	19,690	699,832	210,155	4,953	359
1914*	12,413	634,221	138,525	2,478	182
1914-15†	19,629	575,940	177,267	5,048	360

* Sanctioned estimates for Jan.-June, 1914.

† Budget estimates for the year July, 1914-June, 1915.

The revenue and the expenditure of the Austrian government and of the Hungarian government have been as follows, in thousands of kronen:

	Austria		Hungary	
	Rev.	Expend.	Rev.	Expend.
1906	2,008,495	1,862,292	1,357,180	1,245,469
1907	2,253,052	2,209,093	1,395,710	1,399,473

	Austria		Hungary	
	Rev.	Expend.	Rev.	Expend.
1908	2,388,884	2,373,894	1,531,368	1,616,245
1909	2,795,703	2,888,648	1,750,783	1,721,564
1910	2,895,492	2,901,864	2,074,548	1,901,666
1911	3,082,782	3,004,085	1,830,779	1,768,349
1912	3,173,309	3,184,861	1,954,877	2,013,261

In Austria, the budget for the fiscal year 1914-15 showed estimated revenue of 3,460,987,902 kronen (3,194,355,951 kronen ordinary, 266,631,951 kronen extraordinary), and estimated expenditure of 3,460,726,156 kronen (3,064,872,060 kronen ordinary, 396,054,096 kronen extraordinary). The larger departmental avenues of total revenue and expenditure were estimated as follows:

	Revenue	Expend.
Finance	2,174,422,176	1,025,551,823
Railways	910,091,210	855,783,720
Contributions to common govt.		587,212,370
Commerce	256,585,460	244,268,873
Public Works	50,773,506	123,465,052
Interior	2,469,137	63,279,510
Defense	1,148,557	181,810,603
Worship and Instruction	18,627,710	125,759,100
Agriculture	27,136,736	64,659,731
Domains, new buildings, etc.	900,992	33,681,884
Pensions	10,000,528	140,018,371
Imperial household		11,300,000
Total, including other.	3,460,987,902	3,460,726,156

In Hungary, the budget for the fiscal year 1914-15 showed estimated revenue of 2,264,157,883 kronen (1,953,605,613 kronen ordinary), and estimated expenditure of 2,264,096,830 kronen (1,878,270,912 kronen ordinary). The larger sources of estimated ordinary revenue were: indirect taxes, 758,214,781 kronen; railways, 496,000,000; direct taxes, 326,077,000; state properties, etc., 170,609,045; posts and telegraphs, 111,280,000. The larger branches of estimated expenditure were: ministry of commerce, 519,433,580 kronen; national debt, 262,191,456; ministry of finance, 285,627,567; worship and public instruction, 132,620,783.

In Bosnia and the Herzegovina, the budget for 1913 showed estimated revenue and expenditure of 92,997,594 kronen and 92,987,887 kronen, respectively.

In accordance with the terms under which the union of Austria and Hungary was effected in 1867, no debts are contracted by the monarchy. The total general debt, contracted before that date, amounted on Jan. 1, 1914, to 5,141,254,657 kronen, of which 5,113,291,961 kronen formed the consolidated debt. On the same date, the Austrian debt was 7,467,346,388 kronen, of which 7,120,210,658 kronen formed the consolidated debt. The Hungarian debt in 1912 amounted to 6,592,846,069 kronen.

ARMY. See MILITARY PROGRESS, *passim*.

NAVY. On account of the great war, naval statistics cannot be given beyond 1914. On July 1 of that year, about one month before the war began, the number and displacement of warships of 1500 or more tons, and of torpedo craft of 50 or more tons, built and building, were as follows: dreadnoughts (battleships having a main battery of all big guns, that is, 11 or more inches in caliber): built, three, of 60,030 tons; building, four, of 93,510 tons. Predreadnoughts (battleships of about 10,000 or more tons displacement whose main batteries are of more than one caliber): built, six,

of 74,613 tons; building, none. Coast defense vessels (including smaller battleships and monitors): built, six, of 41,700 tons; building, none. Battle cruisers, none built or building. Armored cruisers: built, two, of 13,380 tons; building, none. Cruisers (unarmored warships of 1500 or more tons): built, five, of 13,815 tons; building, five, of 21,216 tons. Torpedo-boat destroyers: built, 18, of 9450 tons; building, none. Torpedo boats: built, 39, of 6852 tons; building, 24, of 5886 tons. Submarines: built, six, of 1686 tons; building, six, of 5370 tons. Total tonnage: built, 221,526; building, 125,982. On the date above mentioned, Austria-Hungary held eighth place among the nations in amount of warship tonnage completed and also in the aggregate of tonnage built and building. In the foregoing figures, certain vessels are not included, viz.: ships over 20 years old from date of launch unless reconstructed and rearmed within five years; torpedo craft over 15 years old; transports, colliers, repair ships, torpedo-depot ships, and other auxiliaries; vessels not actually begun or ordered, although authorized. See also NAVAL PROGRESS.

GOVERNMENT. The administration of the monarchy is directed by the Emperor-King, acting through three ministries, for foreign affairs, finance, and war. The admiralty is a department of the war ministry. The common government deals with finance relating to the monarchy as a whole, foreign affairs, the diplomatic, consular, postal, and telegraphic services, and certain state monopolies. The ministers are responsible to the two delegations. These bodies, consisting of 60 members each, are elected by the Austrian and Hungarian parliaments respectively; they convene each year, alternately at Vienna and Budapest. The delegations examine the requirements of the common services of the monarchy and advise the parliaments as to necessary appropriations. Austria and Hungary have each a representative parliament of two houses and a responsible ministry. Each of the Austrian crownlands has a diet, and there is also a diet for Croatia and Slavonia. Bosnia and the Herzegovina are administered under the (common) ministry of finance.

The sovereign in 1915 was Franz Joseph I, who was born Aug. 18, 1830. He became Emperor of Austria Dec. 2, 1848, and King of Hungary June 8, 1867. The heir presumptive was the Archduke Karl Franz Joseph, born Aug. 17, 1887, son of the late Archduke Otho Franz Joseph and nephew of the Emperor. The former heir presumptive was the Archduke Franz Ferdinand, son of the late Archduke Karl Ludwig and nephew of the Emperor; Franz Ferdinand and his wife, the Duchess of Hohenburg (Countess Chotek), were assassinated at Sarajevo, Bosnia, June 28, 1914.

The common ministry in 1915: Premier and minister for foreign affairs, Stephan (Baron) Burian von Rajecz (appointed Jan. 14, 1915); finance, Dr. Leon von Bilinski (later Dr. von Koerber); war, Gen. Alexander (Ritter) von Krobatin (appointed Dec. 10, 1912). Commandant of the navy, Admiral Anton Haas (appointed February, 1913). Premier of the Austrian ministry, Karl (Count) Stürgkh (Nov. 3, 1911); premier of the Hungarian ministry, Stephan (Count) Tisza (June 10, 1913).

HISTORY

CABINET CHANGES. An official communiqué, issued January 13, announced the resignation of Count Leopold von Berchtold from the ministry of foreign affairs and the appointment of Baron Stephan Burian von Rajecz to succeed him. As Count Berchtold's resignation occurred just at the time when the Triple Entente appeared to be on the eve of winning the active coöperation of Greece and Rumania, the dismissal of Count Berchtold was in some quarters, particularly in the press of France and Great Britain, interpreted as a sign that Austro-Hungarian diplomacy in the Balkans had failed and that Count Berchtold was blamed by the Emperor for the failure. In accordance with this view, the selection of Baron Burian as the new foreign minister was attributed to the fact that Baron Burian had gained valuable experience in dealing with Balkan races during his service as chief of the administration in Bosnia-Herzegovina, the Serb province of Austria-Hungary, and was considered to be especially conversant with Balkan affairs. In other quarters the supersession of Count Berchtold was ascribed to a lack of harmony between Count Berchtold and Count Tisza, the Hungarian premier; the new foreign minister, it was pointed out, was the son of a former Hungarian premier, and was himself Hungarian minister to the Royal Court; hence the appointment of Baron Burian would be extraordinarily gratifying to the Hungarian element in the Dual Monarchy. In passing, it may be remarked that immediately after Count Berchtold's resignation, the Emperor paid high tribute to Count Berchtold's work and conferred upon him the brilliants of the Grand Cross of the Order of St. Stephen. The new foreign minister announced that he would continue the policy of his predecessor, and as far as the public could discern, fulfilled the promise. The solidarity of Austria-Hungary and Germany was affirmed by a visit which Baron Burian made to Berlin, shortly after his appointment, and the conference he there held with the German government. As far as the Balkan policy of Austria-Hungary was concerned, it soon appeared that the success of the Entente in the Balkans had been exaggerated; Rumania and Greece remained neutral, and presently Bulgaria joined the Central Powers (see separate articles on Balkan States); there is no reason, however, to ascribe the credit for the altered situation to the personal work of Baron Burian, when other circumstances, such as the Anglo-French failure at the Dardanelles, may be adduced in explanation of the Entente's diplomatic failure. Early in February another cabinet change occurred, when the finance minister in the common ministry of Austria-Hungary, Dr. Leon (Ritter) von Bilinski, was replaced by Dr. Ernest von Koerber. The appointment received favorable comment in the Austrian press, as Dr. von Koerber was regarded as an exceedingly able financier, who would successfully pilot the Dual Monarchy through the financial troubles of war-time. In the Austrian cabinet an important change was made at the beginning of December. Three ministers—Dr. Karl (Baron) Heinhold von Udynski, Dr. Rudolf Schuster (Edler) von Bonnot, and Baron August Engel von Mainfelden—resigned their portfolios, and were succeeded respectively by

Prince Hohenlohe Schillingfuerst (minister of the interior), Ritter von Leth (finance), and Herr von Snitzmüller (commerce). The change was regarded as highly significant, because it proved that Austria's internal condition, and above all her economic situation, was sufficiently unsatisfactory to warrant a remodeling of the cabinet.

ECONOMIC CONDITIONS AND RUMORS OF DISCONTENT. As a result of the war's interference with industry and commerce, a grave economic situation arose within the Dual Monarchy. The shortage of grain in Austria, the scarcity of meat, and the enormous rise in food-prices caused severe hardship among the working classes. The gravity of the situation was grossly exaggerated by mendacious news items, emanating chiefly from Rome, Venice, and Geneva, which described bread riots in Vienna, conflicts between angry mobs and the mounted police, and other manifestations of popular unrest, with a wealth of picturesque detail. While most of such reports were absolutely without foundation, it could not be denied that the food question was serious. In the councils of the Austrian cabinet, and in the columns of Vienna newspapers, the supply and price of food were continually discussed. A full explanation of the measures which had been taken to control the situation was vouchsafed by the ministry on January 27th in reply to the questions put by a delegation of the Austrian Herrenhaus. Dr. von Schuster, the minister of commerce, explained that the government was taking steps toward the establishment of an official grain-purchasing society, which would amount to the same thing as a government monopoly of grain; measures were also being taken to restrict the consumption of grain; in the near future the government intended to forbid the use of fine wheat flour without the admixture of coarser meal; the use of flour for pastry would be curtailed; and the employment of foodstuffs for the manufacture of alcoholic beverages would be strictly regulated. In the course of the same conference, Dr. von Zenker, the minister of agriculture, categorically denied that the supply of flour would be exhausted. The army had supplies to last at least to August 31, 1915, and the bountiful crop of maize would reassure the most timid patriot that Austria's food supply would be amply sufficient for the needs of her population. The chief question was one of distribution. The only real shortage of provisions would fall upon horses and cattle, rather than upon the people. "The fact must not be overlooked," said Dr. von Zenker, "that a very appreciable scarcity of fodder materials might arise, since considerable quantities of barley and maize are now demanded for human consumption which formerly were employed for fodder. . . . In this connection special mention should be made of the possibility of using raw sugar for feeding cattle and the measures which have been introduced for the augmentation of the molasses supply." In spite of the government's energetic action in the question of the food supply, many complaints were heard because the more drastic measures which the German government had adopted were not imitated in Austria. The Austrian government had, to be sure, suspended the duties on grain, fixed maximum prices, and attempted in some

slight measure to restrict the consumption of grain; but these measures were not enough. The cost of living continued to soar. At last, on February 24th, the government replied to its critics by publishing a decree for the conservation of the grain and flour supply, ordering an official inventory of the supply of grain and flour on hand, and contemplating complete government regulation of the distribution of grain. Shortly afterwards the amount of flour which each individual might consume was definitely limited, and each person was given a card which must be punched for every ounce of flour consumed by him. These measures, together with the harvesting of a bountiful crop and the arrangements which were effected for the purchase of Rumanian grain, materially relieved the situation. Another aspect of Austria-Hungary's economic condition was the difficulty with which the war loans were raised. In January it was announced that the subscriptions to the war loan amounted to \$670,000,000, of which amount \$433,000,000 had been contributed by Austrian investors, and \$237,000,000 by Hungarian. Six months later the total subscriptions to the second Austrian war loan were reported as amounting to \$530,000,000. According to oft-repeated assertions from Italian and Swiss sources, these subscriptions were secured only with the greatest difficulty. Powerful pressure had to be brought to bear upon investors. Such reports were by their very nature impossible to verify, but at least it is certain that in order to bring the subscriptions up to the above-mentioned totals, the most strenuous and unflagging efforts were made by the Austrian newspapers to impress the investing public with a proper realization of its patriotic duty.

The reported lack of enthusiasm in the reception of the Austrian war loans, combined with the rumors of bread riots, convinced many observers and a very large section of the press outside of Austria-Hungary that the Dual Monarchy was suffering from internal exhaustion and would speedily collapse. Premature reports that Austria-Hungary was being compelled to send middle-aged men and mere striplings to the front, to take the place of the millions of soldiers killed or captured by the Russians, lent added certainty to this conviction. A contagion of cholera was reported to be raging in the military camps. Dispatches from Rome described lurid scenes of mob violence, the erection of barricades by the rebellious populace of Vienna, and crowds shouting "Down with War!" From Rome also came the statement that 300 peace meetings had been arranged for January 24 and prohibited by the Austro-Hungarian government. From correspondents in Geneva, Paris learned that rioting was frequent in the Slavic provinces of the Dual Monarchy as a result of the order for the mobilization of the last line reserves. A Zurich dispatch announced that Joseph Kotek, a leading Czech journalist, had been executed for treason against the Austro-Hungarian government. An eminent English historian, Mr. George Macaulay Trevelyan, informed the British public that the Austro-Hungarian authorities were employing the most cruel and despotic methods to prevent rebellion among the Slavic peoples of the monarchy. Young men, incorporated in the army against their will, were deterred from

deserting or rebelling by the fear that their families would be visited with cruel and unjust punishment. Hundreds of leading citizens, including many Roman Catholic priests, had been cast into prison, said Mr. Trevelyan, lest they should stir up the people to revolt.

THE LOYALTY OF HUNGARY. One of the most frequently repeated rumors of discontent in the Dual Monarchy concerned public sentiment in Hungary. The Magyars, it was suggested, were anxious for peace and bitterly hostile to Austria. The subordinate Slavic races of Hungary were in a ferment of nationalist agitation. Quite a different impression is gained from the public declarations of the Hungarian premier, Count Tisza, and from the records of the speeches in the Hungarian Parliament during the year. In a speech at Budapest, January 31, Count Tisza declared that the war had strikingly demonstrated the fundamental solidarity of the races within the Dual Monarchy. "Antagonism and divergence of opinions," he believed, "among the peoples of the Austro-Hungarian monarchy have disappeared." When the Hungarian Parliament met for its second war session, April 19, the House of Representatives enthusiastically applauded the opening address of its president, Herr von Beöthy, in which the confident determination to win the war was expressed. The following day, April 20, Herr von Beöthy again evoked ringing applause by reading a telegram from the commander-in-chief, Field Marshal Archduke Frederick, praising the gallantry of the troops, and declaring that the army was determined to fight "until our enemies are completely defeated and happy peace is achieved." When a bill to extend the age-limits during which citizens might be called upon for emergency service in the Landsturm—the new limits proposed included men from 18 to 50 years of age—was introduced, one after another the various parties in the House of Representatives signified their approval. Bakonyi, in behalf of the Hungarian Independence Party, suggested a few minor amendments, which were subsequently adopted by the government, and demanded that citizens who served in the army should be entitled to vote, but he upheld the bill as necessary to ensure the freedom of his country. Count Julius Andrássy, of the Constitutional Party, promised that the Opposition would vote for the bill in order to prove that "as long as Hungary is in peril, every Hungarian without exception has but one desire: victory." Stephan von Rakovsky, of the people's party, approved the bill and demanded that the military authorities should be less lenient in exempting men from military service. Guido Hreljanovic, in behalf of the Croats, declared that "the Croat nation has for centuries loyally fulfilled its duty to the King whenever called upon to do so"; he likewise would vote for the bill. Johann Juriga, a Slovak, referred with pride to the unswerving loyalty which the Slovak soldiers had manifested, and asserted that the Slovaks were willing to die in defense of Hungary; in return, he hoped that Hungary would generously recognize some of the hitherto unsatisfied nationalist aims of the Slovaks. Stephan Szabo, of the Farmers' party, approved the bill without reserve. The bill was then adopted, with only one negative vote, cast by Geza Polonyi. After

the Landsturm Bill had been passed, a bill to extend the mandate of the present Parliament was taken under consideration. The debate led to some interesting demands for electoral reform, but no serious opposition was encountered, and the term was extended from June 20, 1915, until six months after the conclusion of peace. Both bills were ratified without difficulty by the House of Magnates. Interpellations regarding rumored speculation and corruption in the business of buying supplies for the army led to a warmer debate in the House of Representatives. Perhaps the most interesting feature of the session was the bill submitted, April 29, by Stephan Rakovsky, in behalf of the People's Party, for the extension of the parliamentary franchise to include all who served in the army during the war, as a recognition of "the unparalleled bravery and self-sacrifice which our soldiers show on the field of battle." Count Tisza replied that the government could not accept the bill, inasmuch as it would lead logically to universal suffrage, and "on grounds that it would take too long to explain now, I believe that introduction of universal suffrage in Hungary would be a national misfortune." Accordingly the government majority in the House defeated the bill, although the Opposition voted solidly in favor of it. The winter session of the Hungarian Parliament was notable for the debate on foreign policy which occurred early in December. Count Karolyi at that time made a remarkable plea for peace, urging that the Central Powers were in so strong a military position that no hesitation need be felt about the propriety of discussing proposals to end the war. Count Andrássy, on the other hand, held that peace was still unattainable, inasmuch as Austria's enemies were not yet willing to admit defeat. Count Tisza, the Hungarian premier, made a significant reference to Rumania's apparent indecision, and expressed the belief that Rumania would best accomplish her national aims by siding with the Central Powers.

FOREIGN AFFAIRS. The break between Austria-Hungary and Italy is treated in the article on the WAR OF THE NATIONS (q.v.). The diplomatic correspondence between Austria-Hungary and the United States will be found under UNITED STATES AND THE WAR.

OTHER EVENTS. Veljko Cubrilovic, Misko Jovanovic, and Danilo Ilic, three of the conspirators convicted of complicity in the murder of the Archduke at Sarajevo, were executed on February 3rd. Two other conspirators, Jakob Milovic and Nedjo Kerovic, were fortunate enough to have their sentence of execution commuted to imprisonment respectively for life and for 20 years. A son was born to the heir apparent, Archduke Charles Francis, February 9. A sensation was caused by the reported dismissal and imprisonment of Field Marshal Moritz von Auffenberg, former chief of staff and war minister, who won the brilliant victory of Kamarow; von Auffenberg was accused of plotting to sell Austro-German military secrets to the Russians.

AUSTRIAN ACTIVITIES IN UNITED STATES. See UNITED STATES AND THE WAR.

AUTHORS' LEAGUE OF AMERICA. The league is a business association of authors for mutual service, benefit, and protection. All producers of books subject to copyright protection,

writers of novels, poems, stories, essays, text-books, etc., dramatic and photoplay authors, painters, illustrators, composers, sculptors, photographers, etc., can be admitted as regular members; publishers, theatrical managers, literary and dramatic agents, and others, can be admitted as associate members. The more important services which the league is able to do for its members are those of the legal, collection, mailing, and copyright bureaus. The legal bureau, without extra cost to a member, advises as to the signing of a contract or agreement with a publisher, theatrical manager, editor, or agent, etc.; receives and preserves the agreements of members in safe deposits, advises the producers of books as to proper conditions of sale; gives instructions and warnings to authors, publishers, motion-picture manufacturers, magazine contributors, etc. The league, through its collection bureau, helps its members to collect moneys and check accounts due under contracts. The mailing bureau gives information upon application; and the copyright bureau aids the members without cost except for the payment of registration fees plus the cost of money orders and postage. The officers for 1915-16 are: President, Winston Churchill; vice-president, Theodore Roosevelt; secretary and treasurer, Eric Schuler; general counsel, Arthur C. Nain; attorney, B. H. Stern; English agent, Curtis Brown.

AUTOLYSIN. The past year has brought forth the usual crop of alleged cancer cures, of which autolysin is perhaps the most notable. The remedy, known also as the Horowitz serum and the Horowitz-Beebe serum, is composed of a congeries of vegetable extracts, but the exact formula has not yet been divulged. The remedy has not been found of any value except by its exploiters who brought further condemnation upon it by the manner in which it was put before the public. See **CANCER**.

AUTOMOBILES, RACING EVENTS. A big boom in automobile racing marked the year 1915. This was in large measure due to the construction of speedways in all sections of the United States. During the year there were 22 contests held on roads and speedways and 59 on dirt tracks. It is estimated that about \$282,000 was distributed in prizes. Some 300 drivers competed in these events, 10 of them receiving \$220,000. Twenty-five others divided \$50,000. Four sanctioned hill climbs also furnished liberal prizes to the competitors.

Earl Cooper in a Stutz car was for the second successive year the most consistent winning driver, but to Dario Resta fell the honor of establishing the largest number of new records. Resta in a Peugeot at Indianapolis on May 31 covered 100 miles in 1 hour, 7 minutes, 29.59 seconds, and 150 miles in 1 hour, 40 minutes, 38.15 seconds. At Chicago the same driver went 200 miles in 2 hours, 2 minutes, 17.67 seconds; 300 miles in 3 hours, 3 minutes, 19.17 seconds; 400 miles in 4 hours, 4 minutes, 49 seconds, and 500 miles in 5 hours, 7 minutes, 26 seconds.

The winners and the average times made in the principal races of the year follow:

Vanderbilt Cup—300.78 miles—Resta in a Peugeot, 66.29 miles per hour; Grand Prize—402.75 miles—Resta in a Peugeot, 56.78 miles per hour; Elgin National—301.44 miles—Anderson in a Stutz, 77.25 miles per hour; Santa

Monica—445.2 miles—Cooper in a Stutz, 73.77 miles per hour.

INDUSTRIAL, ETC. The American automobile industry during 1915 was in a flourishing condition and many factors contributed to its progress and success. There was an extraordinary demand from Europe for motor trucks for the armies of the Allies as well as for passenger cars, and at the end of the year the estimated value of exports of commercial vehicles was given at \$63,000,000, an increase of 600 per cent, and for passenger cars \$37,000,000, an increase of 90 per cent. In the United States the demand for cars of all classes continued, particularly for the moderate and lower priced cars, and the number sold during the year was given at 842,249 passenger cars, of a value of \$565,856,450, and 50,369 motor trucks, of a value of \$125,922,500, making a total number of cars and trucks sold in 1915 of 892,618, with a retail value of \$691,778,950. In 1914 the exports of automobiles amounted to \$28,507,464, and in 1915 shipments to 80 different countries increased 250 per cent, and were estimated to exceed \$100,000,000, England alone taking some \$21,000,000 worth of pleasure cars and trucks. On July 1, 1915, 2,070,000 vehicles were registered in the United States, and in New York State on Dec. 1, 1915, there were 231,713, while in California on Oct. 1, 1915, there were 160,000 were registered, and in the 10 leading grain States 677,000.

In 1915 manufacturers of passenger and commercial cars numbered 448, while 257 manufacturers devoted their attention to commercial vehicles. Dealers, garage keepers, retail shops, and supply stores amounted in number to 27,700. The proportion of motor vehicles to population in the United States had steadily decreased, so that by 1915 there was one motor vehicle to each 48 inhabitants, and one to each mile of road. Iowa, with a total registration of 117,407 cars, had one car to every 19 persons. The average price of a passenger car had been reduced to \$672, whereas in 1899 for the steam runabouts then in use the average was \$1284, and in 1907, when the gasoline car was well developed, \$2123.

Registration taxes in 1915 exceeded \$14,000,000. The value of cars in 1899 was estimated at \$4,750,000, and the production in 1903 was valued at \$12,650,000, so that the output of cars and trucks in 1915, which nearly reached \$700,000,000 in value, was testimony as to the growth of the industry.

In the development of the automobile industry there naturally were striking improvements and the tendency towards efficient organization and general efficiency and economy of manufacturing exhibited in mechanical engineering had full play. With demand, facilities for manufacturing increased rapidly, and in many cases plants were extended so as to double and triple the output in successive years, and, with cars manufactured at a lower cost, there has been no sacrifice of strength or reliability. Indeed, the lower priced cars have shown relatively more improvement and better quality than some that have for years shown such special and careful workmanship as to sell at the top figures.

The engine developments in cars during 1915 were mainly in the direction of using an increased number of cylinders. The twin four and twin six, making 8 cylinder and 12 cylinder

engines set in pairs at a V angle, became popular and showed many advantages, especially a constant and even torque on the driving shaft and absence of vibration, and an ease and flexibility of control, as well as ability to accelerate rapidly. This innovation extended to moderate priced cars as well as those of high cost. Naturally the increased number of cylinders was accompanied by a reduction in size, a lessened weight of moving parts, and a much higher speed of revolution, so that there was a gain in horse power with but a relatively slight increase in the weight of the engine. The motor vehicle with the greater number of cylinders showed an advantage over the 6 cylinder car, which did not meet in many instances all the requirements for touring, where the country was rough and hilly. Naturally on all the higher and medium priced cars self-starting devices were furnished, and even with a number of the cheaper cars they were either supplied or could be fitted. The usual practice was to provide a small generator for starting and lighting, and a number of efficient systems were on the market and installed on well known cars.

One of the novelties of the year was a gas-electric drive, where a 6 cylinder engine was directly connected to a generator. This generator supplies current to a motor connected through the transmission system with the wheels. The engine is controlled by a throttle pedal of the usual type, and at the steering wheel there is a speed controller somewhat similar to the controller on an ordinary trolley car. The Entz system, as this new method of electro-magnetic transmission was known from its inventor, seemed to have great hill-climbing possibilities, and the engine could be readily accelerated as well as retarded and the car braked when necessary. The new method was the most radical invention that had been introduced in motor car practice in recent years, and the performance of the cars turned out on a commercial basis was attracting much attention.

The automobile industry was in such condition at the end of the year that it was estimated that in 1916 the motor car output would exceed 1,200,000 cars, and that there would be in the future a market for automobiles in the United States to the number of 5,000,000, as it was claimed that any person with an income of \$1200 could own and keep a car. A competent critic at the end of the year pronounced that the standard car of the future would have a small bore engine running at high speed of revolution, would weigh midway between the heavy and expensive car and the light and cheap runabouts, and that it would cost in the neighborhood of \$1200. When it was realized that the tendency was to decrease the price of the higher cost cars, and to improve, with corresponding increase of price, the cheaper cars, such a prophecy seemed justified.

BACILLUS. See BACTERIOLOGY.

BACTERIOLOGY. The studies that led up to the final demonstration of the elective affinity that certain bacteria and certain strains of bacteria have for particular tissues, constitutes one of the most interesting chapters in bacteriology. Forschner recognized this possibil-

ity as early as 1902. He discovered that streptococci obtained from a variety of sources when grown artificially on kidney tissue would, when injected intravenously, localize in the kidneys of animals; but the full importance of this elective tissue affinity was not realized until many years later. Rosenow succeeded in isolating streptococci from the lesions of acute rheumatism, gall-bladder infection, appendicitis, gastric and duodenal ulcer, and even erythema and herpes zoster. These streptococci, though not virulent, resembled each other closely in their cultural and morphological features. When injected into animals each strain showed a tendency to localize in the organ corresponding to that from which it had been obtained. Going further, streptococci with simple tissue predilection were isolated from recognized sources of infection, such as diseased tonsils and teeth. These organisms when first isolated were usually specific for certain tissues or organs, but this specificity was lost, however, by frequent passage through animals or artificial cultivation, and other tissue predilections were acquired. The appendix strains, for example, soon lost their specific quality and acquired affinity for the tissue of the stomach and gall-bladder. These experiences emphasize the importance of destroying possible foci of infection, such as diseased tonsils, or diseased teeth with pus pockets about their roots; since bacteria lodging there may be carried by the blood stream to distant organs or joints where they find a favorable habitat and where they may produce serious pathological conditions, and they also offer a possible explanation of the frequent association of appendicitis and gall-bladder disease. Rosenow's experiments further showed that virulence seemed to be one of the factors in determining the location of bacteria injected into the blood stream, and he argues that if this be true then the occurrence of ulcer and cholecystitis should become greater as the strains from the appendix are passed through animals; while on the other hand, appendicitis should occur oftener after inoculation with strains of bacteria from ulcers and cholecystitis which have lost their virulence by cultivation upon artificial mediums; and this was found actually to be the case. Other observations were that none of the strains from appendicitis attacked the pancreas, while the strains from ulcers and cholecystitis produced pancreatitis in from 3 to 5 per cent of animals injected. Lesions in the kidney were especially common after the injection of streptococci isolated from cases of rheumatic fever (39 per cent) and from endocarditis (20 per cent).

BACILLUS BULGARICUS. The use of sour milk in various diseases received a setback by the results of several investigations carried on during the past year. The object of sour milk therapy had been to implant organisms of the bacillus bulgaricus type in those parts of the bowel which were already the seat of undesirable putrefaction. The expectation was that the bacilli would displace or drive out the harmful bacteria, since it had been experimentally determined that the Bulgarian bacillus could flourish in an acid medium. Herter and Kendall were able to obtain an acid reaction throughout the intestinal tract of a monkey fed for two weeks on fermented milk, the acid reaction being more pronounced in the small

intestine than in the large. The reaction grew very faint toward the end of the intestine. The regions which are mostly the seat of fermentative processes failed to receive any benefit from the lactic acid bacilli. The latest contribution, that of A. H. Rahe, added evidence that the Bulgarian bacillus cannot adapt itself to the lower intestine of the human being. These investigations are important from the fact that not only sour milk of all kinds, but bacterial cultures, are used extensively by the American public with or without the advice of physicians. It seemed probable that the marvelous results attributed to sour milk in a wide variety of intestinal ailments might be due more to a change of diet and a partial deprivation from injurious foods, than to any specific action on the part of the bacillus itself. See also APPENDICITIS; HYGIENE; SURGERY; and TYPHOID FEVER.

BAHAMAS. The most northerly of the British West Indian colonies; a chain of about 20 inhabited islands and numerous islets and rocks. Total area, 4403½ square miles; population (1911), 55,944 (of whom 13,554 in the island of New Providence). Nassau, or New Providence, is the capital. Sponges are the principal export (£110,740 in 1910, £148,319 in 1913). The other products for export include preserved fruits (£9219 in 1910, £6208 in 1913), pineapples, oranges, and grapefruit. Area planted to sisal in 1913, over 20,000 acres; export, 7,249,496 pounds, valued at £69,950.

	1909	1910	1912	1913
Imports	£343,489	£329,014	£358,111	£408,529
Exports * . . .	165,116	188,286	276,115	263,954
Revenue	77,578	84,386	97,574	100,753
Expenditure . .	92,858	85,315	88,077	96,496
Shipping † . .	1,304,660	1,722,340	1,247,844	1,747,779

* Of colonial produce. † Tonnage entered and cleared.

Revenue and expenditure are for fiscal years. Customs revenue 1913-14, £83,928. Public debt (March 31, 1914), £43,829. There are 48 unsectarian government schools, with 6386 pupils. The population is mainly negro. W. L. Allardyce was appointed Governor in 1914.

BALLOONS. See AERONAUTICS.

BANCROFT, WILLIAM H. American railroad official, died April 22, 1915. He was born in 1840 at Newburg, Ohio; was educated in the public schools there; entered the railroad service as a telegraph operator on the Michigan Southern; and was afterwards employed in other capacities on other roads. Rising rapidly, in 1862 he was appointed assistant superintendent of the Atchison, Topeka, and Santa Fé Road; served as superintendent of other roads; and in 1890 was appointed general superintendent of the Mountain Division of the Union Pacific. From 1897 until his death he was vice-president and general manager of the Oregon Short Line. At different periods he served as general manager of the Union Pacific and the Southern Pacific railroads.

BANDBOX THEATRE. See DRAMA, AMERICAN AND ENGLISH.

BANK CLEARING. See FINANCIAL REVIEW.

BANKS AND BANKING. The most striking feature of the banking history of 1915 was the marvelous strength shown by the banks of the United States. The fall of 1914 had been one of great uncertainty with possibilities of a banking panic. The obligations of America to various European countries for trade balances aggregated several hundred million dollars and envoys were sent to America to enforce collection. During the last seven months of the year gold exports exceeded \$175,000,000; but American banks, mainly those at New York, formed a gold pool of \$100,000,000 to meet immediately maturing obligations abroad and a cotton pool of \$100,000,000 to assist southern farmers in carrying an enormous cotton crop. By combining resources a basis for \$215,000,000 of clearing house certificates was secured, and before the completed organization of the Federal reserve system \$384,000,000 of emergency currency was put out. The banks thus entered 1915 with the most critical demands already met. Early in the year clearing house certificates were retired and emergency circulation was withdrawn. Gradually the improvement of trade resulted in an expansion of deposits and loans; confidence returned and banks in general experienced a profitable year. See AGRICULTURAL CREDIT; AGRICULTURAL LEGISLATION; BLUE SKY LAWS; FINANCIAL REVIEW; NATIONAL BANKS; STATE BANKS; SAVINGS BANKS.

According to reports of the Comptroller of the Currency there were on June 23, 1915, 27,064 banks in the United States of which 7605 were national, 14,598 State banks, 630 mutual savings banks, 1529 stock savings banks, 1664 loan and trust companies, and 1036 private banks. The aggregate resources of all of these institutions were \$28,275,000,000, an increase of over \$1,100,000,000 over June 30, 1914. Aggregate loans were \$15,850,000,000.

LEGISLATION. Numerous laws regulating banking were enacted in the various States. State banks were authorized to join the Federal reserve system by various States. Idaho, Kansas, Michigan, Nebraska, New Mexico, and other States raised the requirements and increased the regulation of trust companies. Kansas enacted a law preventing a bank engaged in trade or commerce from investing in the stock of other banks or corporations, or dealing in their own shares unless to prevent loss on debts previously contracted. The guarantee of bank deposits was provided for in Indiana and South Dakota, thus evidencing the gradual growth of favor for this principle in Middle Western States. A general codification of banking laws was carried through in South Dakota; and general laws for the regulation of banks and the creation of a State Banking Department were enacted in Montana. In Indiana, New Hampshire, New Mexico, and Washington general laws regarding the incorporation of various kinds of banks and their regulation were enacted.

FEDERAL RESERVE SYSTEM. The first year of the Federal reserve system was completed Nov. 16, 1915. It should, however, be noted that the opening of reserve banks had been expedited on account of a temporary money stringency due to the war. The result was that the final details

of regulation for the conduct of the reserve banks were not issued until several months later. Moreover, so effective were the measures taken to prevent a collapse of credit and so phenomenal was the growth of business during 1915 that throughout nearly all of the year the money market was easy and there was a gradual retirement of emergency currency and clearing house certificates. Nevertheless the first year's operations produced numerous significant results and brought forward various plans for the extension of the services of the system. Among the accomplishments may be mentioned the following: there was considerable progress in the standardization of commercial paper, and along with that a standardization of discount rates by city banks owing to the rediscount rates published weekly by the reserve banks; new regulations regarding exercise of trustee and executor powers by banks placed a premium upon sound banking; a system of bankers acceptance business was begun; the first steps in the development of a national system of clearances and check collection was inaugurated; and there was a considerable education of bankers and business men in essential principles of sound banking and credit. There was discussion, too, of the proposal to establish foreign branches, but at a session of the Federal Reserve Board on October 12th it was decided that the best policy was not to compete with member banks in the establishment of foreign branches, but to merely cooperate with and encourage member banks in such a policy. The National City Bank of New York had undertaken in 1914 and 1915 the establishment of branches in Latin America, and it was deemed unwise for the Federal reserve system to enter into competition in the same field. It was, however, deemed desirable to ask Congress for an amendment to the Federal Reserve Act which would enable American member banks to cooperate in establishing joint foreign agencies. This position of the Federal Reserve Board would not prevent them from establishing a joint agency for member banks in any foreign city where member banks had not themselves already established branches. In the fall Secretary of the Treasury McAdoo announced that the government would deposit \$30,000,000 in gold in the Federal reserve banks of Atlanta, Dallas, and Richmond for the relief of cotton growers. The plan permitted Southern banks to draw upon this fund without interest for whatever amount planters would borrow on their cotton warehouse receipts, it being understood that the planters would be charged not more than 2 per cent interest. This action was due in part to the placing of cotton on the contraband list by Great Britain. On November 24th Attorney-General Gregory rendered an opinion at the request of the Federal Reserve Board that under the Reserve Act the Board was given no authority to remove a reserve bank from the city in which it was ordinarily placed by the Organization Committee to another city of the district. Thus, for example, the Board could not remove the reserve bank of the Fifth Reserve District from Richmond to Baltimore.

FEDERAL RESERVE CLEARING SYSTEM. The Federal Reserve Act gave the Board authority to develop a system of clearances among member institutions. The first step in this direction was the inauguration of a plan of intra-district clearing. By this plan each reserve bank under-

took to serve as a clearing house for all member institutions, thus greatly facilitating settlements between banks within each district. The second step was the establishment of the Gold Settlement Fund, the completion of preliminary arrangements for which was announced on April 7th. This fund was to be created by deposits in gold by the 12 reserve banks to be held at Washington and used in liquidating balances among themselves. The deposit of each bank would be counted as part of its reserve. Thus the Federal Reserve Board at Washington would serve as a clearing house for the 12 reserve banks. Two other steps in the development of a completed system of national clearances were contemplated. If the plan for intra-district settlements should prove successful there would be developed a plan for inter-district settlements whereby the member banks of one district could settle claims against those of other districts. The final step taken was the creation of a "par list," or a list of banks, checks upon which would be collectible without exchange. While enrollment on such a list would be voluntary, it was believed that the competitive advantage of such enrollment would induce banks to join in the plan. It was believed, too, by many that these steps in the development of a clearance system would virtually introduce the fundamental principles of a central bank.

RESERVE SYSTEM AND THE TRUST COMPANIES. The Federal Reserve Act gave the Reserve Board authority to grant national banks the privilege of transacting a trust business or exercising the functions of trustee, executor, administrator, and registrar of stocks and bonds, when such action was not in violation of State law. The object of this provision was to maintain an equality of banking privileges between national and State banks, the latter being admitted to the reserve system on the same conditions as national banks. On February 15th the Board issued a statement of conditions under which national banks would be given trust company privileges, and numerous applications were soon filed. In some States the State banks and trust companies fearing the competition of national banks at once sought to induce State authorities to prevent the exercise of the new privileges. Several State Legislatures were persuaded to prohibit trust functions to national banks; while several others in the West and Middle West expressly authorized national banks to exercise the new functions. The trust companies further sought judicial opinion to sustain their view and arranged to bring to test the constitutionality of this provision of the Reserve Act.

STATE BANKS AND THE RESERVE SYSTEM. Early in the summer the Reserve Board issued a statement of the regulations under which State banks might enter the system. These permitted the withdrawal of State banks that had become members; and permitted State banks becoming members to continue to exercise their statutory and charter rights. Thus they could continue to make loans on real estate, a privilege not permitted national banks. Admission is at the discretion of the Reserve Board, and only strong institutions are to be taken in. Reliance as to their condition will be very largely placed in State examinations so as to avoid unnecessary expense and duplicate examiners.

STATISTICS. The resources of the 12 Federal

Reserve Banks on Dec. 24, 1915, aggregated \$490,808,000. In this were included gold reserves of \$347,381,000, and bills discounted and bought \$54,421,000. The liabilities included capital paid in amounting to \$54,901,000, reserve deposits of \$398,603,000; government deposits of \$15,000,000; and reserve notes in circulation of \$14,670,000.

BAPTISTS. Statistics of the Baptists in the United States in 1915, according to the *American Baptist Year Book* for that year, give the total number of 5,932,364, as compared with 5,799,253 for 1914. The total number in the world, according to the same authority, was 7,003,737 in 1915, as compared with 6,846,286 in 1914. There were in the United States in 1915, 2000 Baptist associations, 52,410 churches, and 37,371 ordained ministers. The Baptists in the United States are divided into two main, and a number of smaller branches. The two main branches are known as the regular Baptists, and include the Northern and Southern Baptists. The Northern Baptists had in 1914, 1,291,668 communicants, 9534 churches, and 8250 ministers. The Southern Baptists had in 1914, 2,522,623 communicants, 24,288 churches, and 14,909 ministers. The larger of the smaller subdivisions are the Primitive Baptists, with about 100,000 communicants; the Free Baptists (see below); the Free Will Baptists, with about 60,000 communicants; and the General Baptists, with about 34,000 communicants. The denomination has a large colored membership in the South. There were, in 1915, about 2,000,000 communicants in the regular colored Baptist denomination. There are in addition several smaller divisions of the colored Baptists. The general work of the larger denominations is in the hands of the Northern Baptists' Convention, and the Southern Baptists' Convention. The meeting of the Northern Baptists' Convention was held at Los Angeles, Cal., in May. The Southern Baptists' Convention was also held in May. The missionary work of the denomination is conducted by the American Baptist Foreign Missionary Society and the American Baptist Home Missionary Society. Missions are maintained in practically all quarters of the globe. For foreign missions there were contributed in 1915, \$1,231,664, as compared with \$1,206,202 in 1914; for home missions, \$965,698, as compared with \$959,557 in 1914; and for State missions, \$1,059,914, as compared with \$993,893 in 1914. The total contributions for all purposes in 1915 amounted to \$29,043,181, as compared with \$27,549,711 in 1914. The Baptists maintain 14 theological seminaries and have under their control 100 academies, colleges, and universities. There were, in 1915, 42,769 Sunday schools, with 325,475 officers and teachers, and 3,288,992 scholars. The Sunday school work and the publication work is done through the Sunday school board. For an account of the movement to unite the Baptists and Free Baptists, see BAPTISTS, FREE.

BAPTISTS, FREE. The union between this denomination and the regular Baptist denomination is for practical purposes completed. The union of State organizations has been almost entirely accomplished in most of the States. In some cases the designation United Baptist is made. The union between the denominations was inaugurated in October, 1911, by the transference on the part of the Free Baptists of their missionary and denominational activities to the

three national mission organizations of the Baptists, the American Baptist Foreign Mission Society, the American Baptist Home Mission Society, and the American Baptist Publishing Society. No statistics of the present membership of the denomination are available.

BAR ASSOCIATION, AMERICAN. The annual meeting of the association in 1915 was held in Salt Lake City, August 17th-19th. In connection with the meeting was held a conference of the commissioners on State laws. The American Institute of Criminal Law and Criminology held its seventh annual meeting in connection with the association. Several distinguished South American jurists were present, and delivered addresses. The various committees of the association made reports, and the President, W. Mel-drim, delivered the annual address, including with it a summary of the most important legislative enactments made in the State Legislature in 1915. Addresses were also made by Hon. Joseph W. Bailey, Hon. Simeon E. Baldwin, Felix Frankfurter, and other well known authorities. The following officers were elected: President, Elihu Root; Secretary, George Whitelock; Treasurer, Frederick Wadhams. The membership of the association in 1915 was about 10,000.

BARBADOS. The most easterly of the Caribbean Islands; a British colony. Its area is 166 square miles, and its population (1911), 171,892. The withdrawal of many laborers from the colony to the Canal Zone, together with emigration to Pará (Brazil) and the United States, accounts for the decrease in population since 1891, when it was 182,306. Bridgetown is the capital, with 16,648 inhabitants in 1911. The area under sugar-cane, the island's most important product, is estimated at 64,000 acres. There were in operation 320 sugar works in 1913, producing 9939 tons of sugar and 82,600 puncheons of molasses. The export of cotton to Great Britain in 1913 was 433,099 pounds, valued at £28,460. In the following table, imports, exports, and shipping are for the calendar years named; revenue and expenditure for the fiscal years.

	1909-10	1910-11	1911-12	1912-13
	£	£	£	£
Imports	1,119,343	1,345,194	1,465,481	1,853,059
Exports	888,086	1,088,830	1,085,569	856,618
Revenue	195,803	213,297	234,126	214,865
Expenditure	199,624	211,949	230,389	222,177
Shipping *	2,437,086	3,395,085	3,346,982	3,771,598

* Tonnage entered and cleared.

Customs revenue (1913-14), £125,478. Public debt (March 31, 1913), £436,900 (sinking fund, £113,340). Acting Governor in 1914, W. L. C. Phillips.

BARD, THOMAS ROBERT. American public official, former United States Senator to California, died March 5, 1915. He was born in Chambersburg, Pa., in 1848; received an academic education; studied law, but did not practice. He was engaged as transportation agent for the Cumberland Valley Railroad at Hagerstown, Md., in 1861. While in Maryland, he took an active part in a political campaign to prevent the secession of that State. On several occasions he acted as a Union scout. In 1865 Thomas A. Scott, then Assistant Secretary of War, and later president of the Pennsylvania Railroad, sent Bard to Southern California to

take care of his lands there. In California, Bard settled permanently in Hueneme, Ventura County, and in 1867 was elected to the Board of Supervisors. He filled other offices, and was elected to the United States Senate in 1900, serving until 1905.

BARKER, GRANVILLE. See **DRAMA, AMERICAN AND ENGLISH.**

BARLEY. Weather conditions of 1915 were generally favorable to the growth of the barley crop, especially in the principal producing countries, and while the area devoted to the crop as indicated by the data available was about the same as in the previous year the total production of the Northern Hemisphere was considerably higher than in 1914. According to an estimate by the International Institute of Agriculture the total production of the Northern Hemisphere, where, as shown by the average yield of the last five years, over 99 per cent of the world's barley is produced, amounted to 1,580,000,000 bushels. This yield was 13.2 per cent superior to the preceding year's production and 9 per cent above the average production for the last five years. This estimate was based on official data to the extent of 69 per cent, while the production of non-reporting countries was assumed to be the same as the average for the last four or five years. Taking the average of the quantities available during the last five years as a basis, the supply of barley produced in 1915 was regarded as ample to meet the requirements for consumption in 1915-16. The average annual value of barley and malt carried in international trade is estimated at \$220,000,000.

North America produced in 1915 about one quarter of the world's barley crop. Canada produced 50,868,000 bushels on 1,509,350 acres, an average per acre of 33.70 bushels. The United States produced 237,009,000 bushels, as estimated by the United States Department of Agriculture, on 7,395,000 acres, the average yield being 32 bushels per acre. Neither the total production nor the average yield per acre had ever been exceeded. The production was over 40,000,000 bushels greater than in 1914 and over 55,000,000 bushels in excess of the average for the five years 1909-13, and the average acre yield was over nine bushels greater than the average acre yield for this same period. The total farm value based on the average price per bushel, December 1st, and estimated at \$122,499,000, was exceeded by the value of the crop of 1911, when the price per bushel was 86.9 cents as compared with 51.7 cents on December 1st of the past year. According to an inquiry made by the United States Department of Agriculture, about 7,432,000 tons of barley straw are produced in the United States annually, and of this quantity about 60 per cent is fed to stock, 13.3 per cent is burned, 3.6 per cent sold off the farm, and 11.5 per cent plowed under.

BASEBALL. The year 1915 saw the end of the baseball war which was started the year previous and which threatened to deal a severe blow to the popularity of the national game. Talk of peace began immediately after the close of the season, which had been a most disastrous

one for the owners in practically every league. Players were drawing exorbitant salaries, the fans were growing luke-warm, and gate receipts all over the country were rapidly decreasing.

The baseball magnates realized that something must be done and done quickly or financial ruin would be their portion. Informal conferences were held in various cities between the representatives of the Federal League, the trouble-maker, and the officials of so-called "organized ball," or the National and American leagues. The "peace treaty" was signed in Cincinnati, in December, although a few minor details were left for future discussion and settlement. By the terms of the agreement the Federal League passed out of existence, but some of the club owners in that organization were permitted to buy franchises in the older leagues.

The sensational feature of the year as far as the sport itself was concerned was furnished by the Philadelphia National League team led by Pat Moran. This club had been disrupted by the desertion of several of its stars to the Federal League, the year before, and in the opinion of the experts at the opening of the season could only be regarded as a tail-end team.

To the surprise of the fans and critics, however, the Phillies got off to a good start and soon built up a lead which the other clubs found it impossible to overcome. The Brooklyn Superbas made a game fight for first honors, but one disappointing Western trip in which they lost two-thirds of their games put them out of the running and the Phillies breezed through to their first pennant.

The excellent showing of the Philadelphia team was chiefly due to the consistent pitching of Alexander, the heavy hitting of Cravath and Luderus, and the sensational playing of young Bancroft at shortstop.

The American League race was the poorest in the history of that organization. At the beginning of the season it was generally conceded that only three teams had a chance for the pennant—Boston, Detroit, and Chicago—and it was in this order that these clubs finished at the top. The White Sox led the way for two months only to be overhauled by the Tigers and Red Sox in the stretch.

The battle between the Tigers and Red Sox for first place furnished little excitement. Detroit had the heavier "artillery," but Boston more than offset this with the strength of its pitching staff.

The contest for the laurels in the Federal League was much closer than in either of the two older bodies. Chicago, St. Louis, and Pittsburgh came down to the last two weeks of play neck and neck, the Whales finally capturing the flag by a one-point margin. The Federal League challenged the American and National league pennant winners to play games for the world's championship, but organized ball turned down the defl.

The World's Series therefore was contested by Philadelphia for the National League and Boston for the American League. The Red Sox were the natural favorites, the only hope of the Phillies resting in the batting of Cravath and Luderus and the pitching of the great Alexander. These men, save for Luderus, failed to come up to expectations and the well-balanced Boston team had a walkover, winning four of the five games played.

The scores of these contests follow:

Boston, 1, Philadelphia, 3; Boston, 2, Philadelphia, 1; Boston, 2, Philadelphia, 1; Boston, 2, Philadelphia, 1; Boston, 5, Philadelphia, 4.

The composite score of the five games gave Boston a batting average of .264 and a fielding average of .980 as against a batting average of .182 for Philadelphia and a fielding average of .981. The paid attendance was 143,351 and the receipts, \$320,361.50. Each winning player's share was \$3780.25 and each losing player received \$2520.17.

The leading batter in the National League was Larry Doyle of the Giants, who had an average of .320. Ty Cobb of the Detroit Tigers once again showed the way in the American League with an average of .370. Benny Kauff of the Brooklyn Tip Tops excelled with the stick in the Federal League.

Walter Johnson was the best pitcher in the American League, while in the National League Alexander of the Phillies gained the honors.

The final standing of the clubs in the National League was: Philadelphia won 90, lost 62; Boston won 83, lost 69; Brooklyn won 80, lost 72; Chicago won 73, lost 80; Pittsburgh won 73, lost 81; St. Louis won 72, lost 81; Cincinnati won 71, lost 83; New York won 69, lost 83.

The American League standing was: Boston won 101, lost 50; Detroit won 100, lost 54; Chicago won 93, lost 61; Washington won 85, lost 68; New York won 69, lost 83; St. Louis won 63, lost 91; Cleveland won 57, lost 95; Philadelphia won 43, lost 100.

The Federal League standing was: Chicago won 86, lost 66; St. Louis won 87, lost 67; Pittsburgh won 86, lost 67; Kansas City won 81, lost 72; Newark won 80, lost 72; Buffalo won 74, lost 78; Brooklyn won 70, lost 82; Baltimore won 47, lost 107.

The pennant winners in the more important minor leagues were: International, Buffalo; American Association, Minneapolis; Southern Association, New Orleans; New England, Portland; Western, Des Moines; New York State, Binghamton; Amateur, Englewood.

In college baseball Harvard, West Point, Tufts, and Brown made the best showing. Harvard won its two important series with Yale and Princeton and broke even with Brown. During the entire season Harvard won 19 games and lost only 4. The record of other leading college nines follows: Tufts won 18, lost 2; West Point won 18, lost 3; Syracuse won 18, lost 4; Brown won 17, lost 4; Lehigh won 13, lost 5; Annapolis won 16, lost 7; Columbia won 13, lost 6; Yale won 16, lost 8; Princeton won 18, lost 11; Amherst won 10, lost 9; Cornell won 12, lost 12.

BASKETBALL. The American intercollegiate basketball championship was won by Yale with nine victories and two defeats. The standing of the other teams in the league was: Cornell won 7, lost 3; Princeton won 6, lost 4; Columbia won 6, lost 4; Pennsylvania won 3, lost 7; Dartmouth won 0, lost 10. The Illinois five captured the title in the Middle Western Conference League with 11 victories and no defeats. Chicago finished second with 8 games won and 3 games lost.

The championship of the Amateur Athletic Union went to the Olympic Club team of San Francisco which defeated Whittier College of

California in the final game by a score of 29 to 16.

BATES, LINDON, JR. American engineer, died May 8, 1915. He was born in Portland, Oreg., in 1883, the son of Lindon Wallace Bates, an engineer of wide reputation. Lindon Bates, Jr., was educated at Harrow, England, and at Yale University. He graduated from the latter in 1902, at once entering engineering work as vice-president to the Bates Engineering Company. He was consulting engineer for many important companies in the United States and foreign countries. In 1896 he traveled extensively in Europe, and in 1900 made an exploring expedition to the islands north of Hudson Bay. Panama, Siberia, Mongolia, Venezuela, and Brazil were also known to him as a traveler. He took an active interest in political and economic matters; was responsible for reforms in the civil service; and interested himself in direct nominations and employers' liability bills. Of the four engineers appointed by Mayor McClellan to report on a Catskill Aqueduct tunnel he was one. Two of the engineering works with which he was connected were the Galveston Sea Wall and the New York Barge Canal. His published writings include: *The Loss of Water in New York's Distribution System* (1909), *The Russian Road to China* (1910), *The Path of the Conquistadores* (1912). He also contributed on technical and economic subjects to many magazines.

BATTLESHIPS. The operations of the great war in progress in 1915 indicated during the year very little as to the requirements of battleships, for there had been no battleship actions. The battle cruiser had been definitely accepted and the armored cruiser as definitely rejected. In 1914 Rear-Admiral Sir Percy Scott of the British navy declared that "Submarines have done away with the utility of surface ships" (see YEAR BOOK for 1914, p. 92). This statement was still far from being proved. The defense against the submarine was improving rapidly—apparently much faster than the submarine itself. One point seemed quite definitely established: if a large vessel is accompanied by an adequate screen of destroyers, she is comparatively safe against the German short-range torpedo. At longer range, the submarine may have a chance, but her torpedo must be larger or carry a smaller explosive charge.

Except in the United States there was certainly a tendency to higher speed in battleships, though France and Austria were in doubt. Elsewhere the speed of the slowest battleship under consideration is 22.5 knots. The size of the heavy gun for the new ships remained as before—15 inches in England, Germany, and Italy, 14 inches in the United States, Austria, and Japan, 13.4 inches in France, and 12 inches in Russia. As Russia had laid down no capital ships for some years, there was no proof that her ideas had not changed. Italy, France, Great Britain, Austria, and the United States laid down new battleships during 1915, the displacement tonnage being given in the YEAR BOOK for 1914. The exact details of these vessels (except the American ships) will not be officially known until after the close of the war as such information is guarded carefully by the belligerents. In Russia, so far as known, no new battleships had been commenced. Since it was unlikely that they could be finished before the end of the war, no battleships not well advanced at the end of the

BATTLESHIP

year were likely to have much money spent on their construction by the Teutonic allies, as all the funds they had at disposal could be better devoted to army equipment and the completion of vessels nearly ready. This does not apply to destroyers or submarines, but neither of these could have a very great effect upon the outcome of the war.

BATTLE CRUISERS were under construction for England, Russia, Germany, and Japan, and there was reason to believe that the naval appropriation bill for 1916 would contain a provision for several for the United States navy. If built, these vessels were likely to be superior to any so far planned. The tonnage would be well over 30,000—possibly nearer 40,000—and the maximum sea speed about 35 knots. Apart from the line-of-battle, such vessels would have an extended use in warfare. They could sweep aside the cruisers, scouts, and destroyers of the enemy. Their speed makes submarine attack impossible except under most favorable circumstances. And they should be able to bring any fleeing enemy to terms by heading him off or driving in his flank. The amount of armor proposed was not stated. No battle cruisers are heavily armored; but it must not be forgotten that in every decisive battle of recent times the ships of the winning side have received few injuries; nor must we overlook Admiral Farragut's maxim that "a ship's best defense is a rapid and well-directed fire from her own guns."

BAUER, FRANCIS S. An Austrian Cardinal of the Roman Catholic Church, died Nov. 26, 1915. He was born in 1841; became a priest in 1863; was created Archbishop of Olmutz in 1904; and became a cardinal on Dec. 2, 1912.

BAUXITE. See ALUMINUM AND BAUXITE.

BEAUX-ARTS ARCHITECTS, SOCIETY OF. An association formed in New York for the education of students in architecture. The system includes the establishment in different cities of the United States of schools in which instruction in architecture may be obtained. This instruction is based upon the courses given in the Ecole des Beaux-Arts in Paris. The programme of the society is used in many universities and colleges throughout the country. The schools are formed by groups of students who wish to carry on the study of architecture, and instruction is given by a master or patron, whose work is given free. The school is supported by contributions of the students. The committee on education issues each year a certain number of programmes which include problems to be worked out by the different schools. These constitute competitions designated as Class A and Class B. During the season 1914-15 there were 978 registered students from 110 different ateliers, located in over 80 different cities in the United States and Canada. During the year 88 medals were awarded, of which 6 were first medals, 41 second medals, and 41 third medals. The society awards regular prizes—the Warren Prize for general excellence in planning a group of buildings; the Pupin Prize for decorative treatment; the Goelet Prize for excellence in planning a city block; the Bacon Prize for the greatest number of honors obtained in Class A; the Municipal Arts Society Prize for the best solution of a city-planning problem; and the Diplome Prize for added honors in Class A work.

BEEHLER, WILLIAM HENRY. American naval officer and scientist, died June 23, 1915. He was

born in Baltimore in 1848; served in the Union League Company for three weeks in defense of the city of Baltimore in 1863; graduated from the United States Naval Academy in 1868; joined the navy as an ensign in 1869, and was subsequently promoted through various ranks until he became commodore in 1907. He served with the Atlantic and Pacific fleets on various tours until 1879 when he was at the Torpedo Station. From 1885-89 he was at the office of Naval Intelligence; was appointed Chief of Ocean Meteorology of the Navy Department in 1892, serving until 1895; from 1899 to 1902 was naval attaché successively at Berlin, Rome, and Vienna; commandant of the Naval Station at Key West from 1905-10; chairman of the World's Congress of Meteorology at the Chicago Exposition in 1893; and took part in the Spanish-American War, winning two medals for service. The year 1910 saw his retirement. He invented many scientific appliances, including the solarometer (1892), an instrument for determining position and compass error at sea; and he was the author of *The Cruise of the Brooklyn* (1884), and of *The History of the Italian-Turkish War* (1912). He also contributed to magazines, chiefly on naval subjects.

BELGIUM. A constitutional monarchy of western Europe, lying between France and the Netherlands and bordering on the North Sea. Capital, Brussels. During the German invasion the government was removed first to Ostend, later to Le Havre, France.

AREA AND POPULATION. The area and population by provinces, according to the census taken Dec. 31, 1910, and compared with the figures for 1831, with the number of inhabitants (density) per square kilometer in 1910, are as follows:

	Sq. km.	1831	1910	D.
Antwerp	2,832	349,942	968,677	348
Brabant	3,283	561,828	1,469,677	455
West Flanders	3,234	608,226	874,135	272
East Flanders	3,000	742,973	1,120,335	375
Hainaut	3,722	613,179	1,232,867	333
Liège	2,895	375,030	888,341	308
Limburg	2,408	160,090	275,691	116
Luxemburg	4,418	160,762	231,215	52
Namur	3,660	213,784	362,846	99

Total Belg. 29,451* 3,785,814 7,423,784† 254

* 11,371 square miles. † De jure population; de facto population, 7,416,454.

Of the total population in 1910, 3,680,790 were males and 3,742,994 were females. The census of 1900 returned 6,693,548 (3,324,834 males and 3,368,714 females); 1880, 5,520,009; 1850, 4,426,205. Since 1856 the population shows an augmentation of 63.90 per cent, a development by no means equal throughout the provinces, as shown by the following details: Antwerp, 122.95 per cent; Brabant, 96.26; West Flanders, 39.88; East Flanders, 44.19; Hainaut, 60.31; Liège, 76.38; Limburg, 43.81; Luxemburg, 19.33; Namur, 26.79. In the table below will be seen the population of 1900, the population of 1910, the augmentation during the decade due to ex-

cess of births over deaths, and that due to excess of immigration over emigration for the kingdom, by provinces (+ = excess of immigration, — = excess of emigration):

	1900	1910	Ex. Births	Ex. Immigration
Antwerp	819,159	968,677	137,121 +	12,897
Brabant	1,268,535	1,469,677	122,357 +	88,785
W. Flanders	805,236	874,135	105,206 —	36,307
E. Flanders	1,029,971	1,120,385	180,091 —	89,727
Hainaut	1,142,954	1,232,867	78,161 +	11,752
Liège	826,175	888,841	60,537 +	1,629
Limburg	240,796	275,691	48,027 —	8,132
Luxemburg	219,210	231,215	19,596 —	7,591
Namur	846,512	862,846	21,467 —	5,133
Belgium	6,693,548	7,423,784	717,563 +	12,673

The population of Antwerp as calculated Dec. 31, 1911, was 308,618 (with suburbs, 407,773); Brussels, 176,947 (737,432); Liège, 167,676 (243,865); Ghent, 166,715 (211,081); Schaerbeek,* 85,399; Ixelles,* 76,405; Molenbeek-St.-Jean,* 74,857; St.-Gilles,* 66,592; Anderlecht,* 64,425; Malines, 59,191; Bruges, 53,484; Borgerhout, 50,583; Verviers, 46,485; Ostend, 42,638; Louvain, 42,307; Seraing, 41,389; Tournai, 37,198; Courtrai, 35,872; Laeken, 35,714; Alost, 35,272; St.-Nicolas, 34,881; Etterbeek, 33,779; Namur, 32,444; St.-Josse-ten-Noode, 32,282; Berchem, 30,996; Charleroi, 28,891; Uccle, 28,127; Jumet, 28,020; Mons, 27,904; Lierre, 25,985; Forest, 25,671; Roulers, 25,488. The asterisks mark faubourgs of Brussels. The four cities of Antwerp, Brussels, Ghent, and Liège, with their environs, contain 21.16 per cent of the population of the kingdom; but the appearance of urbanization induced by these figures is offset by the fact that the dependent communes cover areas with boundaries widely separated from the urban centres; within these confines are areas devoted to agriculture.

Of the total population in 1910, 2,833,334 spoke French only, 3,220,662 Flemish only, 31,413 German only, 871,288 French and Flemish, 74,993 French and German, 8652 Flemish and German, and 52,547 all three languages. In addition there were 330,893 inhabitants, including children over two years, speaking no one of the three languages. The number of marriages in 1912 was 61,278; births, 171,187; deaths, 112,378; still births, 7789; immigrants, 42,980; emigrants, 35,775.

EDUCATION. In 1910 there were 7525 public primary schools (21,313 teachers and 929,347 pupils), 54 primary normal schools (4725 students), 4722 schools for adults (240,019 scholars), 3112 infant schools (271,237 children). There were 7590 public primary schools in 1911, with 934,830 pupils; 3186 infant schools with 275,911; 4940 adult primary schools, with 246,292; 57 primary normal schools, with 4967. There are both state and private secondary schools, and special, technical, and fine arts institutions. University population: Ghent, 1178; Liège, 2790; Brussels, 1318; Louvain, 2600—total, 7880.

AGRICULTURE. Under cultivation in the kingdom are 2,607,514 hectares (including 721,938 fallow, under brush, and otherwise irregularly productive), of which 1,818,156 under sown crops and grasses, and 67,419 under orchards, gardens, vineyards, etc. The following table gives areas planted to main crops in hectares, the production in metric quintals, and the average yield per hectare in 1913-14:

	Hectares		Quintals		Qs. per ha.
	1913-14	1912-13	1913-14	1912-13	
Wheat	159,494	161,817	4,019,505	3,802,699	25.2
Rye	84,033	84,123	918,088	921,321	27.0
Barley	271,694	277,694	6,960,945	7,220,044	25.6
Oats	28,133	28,133	98,2367	98,2367	4.2
Beets	52,419	52,588	18,919,175	18,919,175	265.5
Tobacco	4,028	4,172	89,369	89,369	22.2

* Sugar beets. † Seed; fibre production, 178,884, quintals.

Estimated number of cattle Dec. 31, 1909, 1,856,833; horses, 255,229; swine, 1,116,500. In 1913 there were 267,160 horses, 1,894,484 cattle, 1,412,293 swine.

MINING AND METALS, ETC. Number of quarries in operation in 1910, 1622, with 35,711 employees; value of products, 66,418,720 francs. In 1912, 1550, with 35,532 employees; value of products, 69,758,300 francs. Coal mines, 1910, 133 (143,701 employees); 23,916,560 metric tons, valued at 348,877,000 francs (14.59 francs per ton). In 1911, 216 mines, of which 127 in operation; output, 23,053,540 tons, valued at 340,279,000 francs. Value of iron ore 1910, 566,950 francs; blende, 139,600 francs; galena, 26,450 francs. Furnace products, 1,852,090 metric tons, valued at 120,161,000 francs; manufactured iron, 299,500 tons, 39,494,000 francs; cast steel ingots, 1,892,160 tons, 161,606,000 francs; worked steel ingots, blooms, and billets, 1,074,210 tons, 98,634,000 francs; finished steel, 1,534,550 tons, 192,220,000 francs; zinc ingots, 181,745 tons, 103,541,000 francs; pig lead, 40,715 tons, 13,464,000 francs; silver from lead, 264,655 kilos, 27,754,000 francs. Value of iron ore 1911, 766,400 francs; blende, 14,250 francs; pig iron, 1912, 160,000,000 francs; manufactured iron, 40,025,000 francs; steel ingots, 242,377,000 francs; steel rails, etc., 257,819,000 francs.

OTHER INDUSTRIES. Manufacturing industries according to the industrial census of 1896 numbered 337,395 enterprises and branches. Of these, 236,000 were permanent establishments, distributed as follows: 165,000 (70.08 per cent) home industries employing no work people; 54,500 (24.09) small enterprises employing one to four workers; 14,800 (5.12) establishments employing 5 to 49 workers; 1500 (0.63) establishments employing 50 to 449 workers; 200 (0.08) great industries employing 500 or more workers. The census returned 169,778 persons engaged in the textile industry, 137,966 in clothing factories, 134,333 in metal works, 128,313 in mines, 93,577 in construction work, 90,443 in factories for the manufacture of foodstuffs, 88,457 in timber and allied industries, and 57,702 in leather factories. There were in operation in 1911, 89 sugar works, output 234,764 tons of raw sugar; 21 sugar refineries, output 121,226 tons; 125 distilleries, output 73,864 kilolitres of alcohol at 50° G.L.; output of the breweries was 1,703,159 kilolitres; of the tobacco manufacturing, 10,141 tons. The fisheries products for 1911 were valued at 6,381,939 francs. The output of the glass factories (1900) was valued at 65,912,000 francs. The number of strikes in 1911 was 156, involving 54,947 strikers; 1906-10, 756, involving 121,416; 1901-05, 474, involving 149,987.

COMMERCE. The table below gives a résumé (in millions of francs) of the trade during the last years of four decades:

	1880	1890	1900	1910
Imports, general...	2,710.4	8,189.2	3,594.4	6,551.7
Imports, special...	1,680.9	1,672.1	2,215.8	4,265.0
Exports, general...	2,225.2	2,948.1	3,297.5	5,694.6
Exports, special...	1,216.7	1,437.0	1,922.9	3,407.4

Imports for consumption and exports of domestic produce are shown in the table below, together with transit trade, for successive years, in thousands of francs.

	1906	1910	1911	1912
Imports	3,454,000	4,265,000	4,508,500	4,958,000
Exports	2,793,800	3,407,400	3,580,300	3,951,500
Transit	2,268,800	2,287,200	2,298,900	2,437,300

Imports and exports in the special trade are given in part in the table below for 1913:

Imports	1913	Exports	1913
Wool	410,198	Wool	350,497
Wheat	398,186	Flax	132,823
Cotton	210,420	Flax yarns	114,402
Lead	29,067	Zinc	98,499
Raw hides	189,156	Raw hides	112,384
Coal	161,957	Vehicles	84,884
Corn	110,425	Rubber	109,249
Rubber	145,235	Iron and steel	251,815
Flax	100,673	Wheat	78,126
Beer	18,078	Coal	90,220
Barley, etc.	73,018	Cotton	84,848
Coffee	92,830	Vegetable oil	31,206
Seeds	172,725	Copper	32,771
Wood	124,505	Machinery	77,112
Jute	14,673	Oil cloth	2,854
Pig iron	43,323	Window glass	45,741
Machinery	107,036	Dyes and colors	68,127
Oil cake	56,309	Corn	24,880
Copper	42,032	Lead	34,712
Chem. prod.	141,696	Horses	40,894
Petroleum	42,108	Wool yarns	65,092
Dyes	65,289	Chemical products	93,601
Wine	40,842	Paper	87,288

A few of the important imports, with values in thousands of francs in 1910, follow: cereals, etc. (582,666); wool and woolens (442,139); minerals (197,462); seeds (171,178); timber (150,494); cotton, etc. (148,489); flax, etc. (143,034); raw hides (139,296); coal (107,478); rough diamonds (98,447); resins, etc. (96,301); iron ore, etc. (92,520); machinery (80,458); dyes, etc. (68,213); coffee (63,699); live animals (53,334). Exports: wool, yard, and manufactures (436,450); iron and steel (224,287); machinery, etc. (180,762); cereals (163,170); raw flax (121,136); vegetable fibre, yarn, and manufactures (113,439); seeds (111,509); cut diamonds (99,057); zinc (91,960); raw hides (91,441); coal (88,636); paints, etc. (85,087); glass and glassware (84,406); cotton manufactures (78,478); resins, etc. (53,010); manures (50,277); sugar (45,151); live animals (42,647).

Some of the principal countries of origin and destination are given below, with value of their trade in thousands of francs for two years:

	1912	1911	1912	1911
	Imports		Exports	
France	738,761	908,048	695,105	752,314
United States	341,423	413,829	113,982	145,128
United King.	486,220	505,646	498,187	594,625
Netherlands	298,217	356,573	852,846	867,599
Germany	602,398	703,120	959,331	1,007,469
British India	267,614	249,551	34,967	40,389
Russia	318,186	272,327	66,904	83,496
Rumania	245,289	200,962	24,283	17,771

In 1910, France furnished imports to the value of 747.2 millions of francs and received exports

valued at 669.1 millions; Germany, 576.1 and 881.4; Great Britain, 516.8 and 457.6; Russia, 364.1 and 67.0; Netherlands, 293.1 and 327.9; Argentina, 278.1 and 128.6; United States, 231.2 and 117.1.

COMMUNICATIONS. Railway in operation, Dec. 31, 1910, by the state, 4330 kilometers (of which 4072 state owned); by companies, 349—a total length of 4679 kilometers throughout the kingdom. At the end of 1912 there were 4719 kilometers of railway in operation, of which 4369 were operated by the state. Local lines, 3855 kilometers. The Belgian railway lines, as a result of the German invasion, came into the possession of the German authorities and were operated by them regularly after November, 1914.

Soon after the military occupation of Belgium by the Germans the permanent way over a large amount of Belgian railway was removed, and this led to a protest to the neutral states by the Belgian government, which claimed that the proceeding would hamper the trade business of the kingdom and was a violation of the laws and customs of war. Furthermore, as an incident of the military operations, a comprehensive network of light railways was constructed in Belgium, as well as in the occupied district of France, so as to relieve the pressure on the highways and release cars for service in the Eastern campaigns. A uniform method of construction was employed, involving light rails of high grade steel, laid on steel ties, and built up in sections so they could be laid very rapidly, four railway battalions being able to lay 70 miles of track in two weeks. Track laying on level ground was in some cases carried forward at the rate of 10 miles a day, or the equivalent of the daily average advance of an army. These railways were narrow gauge, but the passenger cars seated five people on a side.

In the summer the construction of a new railway line between Aix-la-Chapelle and Brussels, via Vise, was begun by the Germans and workmen were busy day and night. This involved the building of a new bridge near Lische. The new railway through Belgium was to be an almost straight line, without regard to private property or natural obstacles, as the German authorities considered such a railway of the greatest importance, not only for immediate service but for the future. It was also proposed to double track the line from Selzaete to Moerbeke and probably also the Selzaete-Ecclloo-Bruges line.

There were 7975 kilometers of telegraph lines and 43,547 of wires; in addition, there were 520 kilometers of wires installed at the expense of private railway companies. There were 1659 telegraph stations. Urban telephone wires, 233,086 kilometers; interurban wires, 29,434. Post offices, 1708. The merchant marine included at the end of 1912, 97 steamers of 174,021 tons and eight sailing vessels, of 7616 tons. Vessels entered in the 1912 trade, 11,230, of 16,353,933 tons; cleared, 11,214, of 16,319,056 tons.

FINANCE. The franc (worth 19.295 cents) is the unit of value. The table of revenue and expenditure below is in thousands of francs and includes loans (1912 budget):

	1835	1900	1909	1912
Rev. ordinary	89,171	494,106	645,107	703,883*
Rev. extraordinary	1,904	48,672	150,109	
Total	91,075	542,778	795,216	

	1835	1900	1909	1912
Exp. ordinary	85,614	479,056	634,450	708,081†
Exp. extraordinary	1,490	95,102	151,747	
Total	87,104	574,158	786,197	

* Direct taxes, 73,166,000 francs; customs, 57,803,650; excise, 81,138,300; registration, 77,253,000; revenue-earning administrations, 371,925,730; domains, dividends, interest, etc., 31,635,090; repayments, etc., 8,458,324.

† Service of the debt, 198,711,930; civil list, 5,479,090; justice, 30,636,400; foreign affairs, 4,990,846; interior, 7,792,915; sciences and arts, 40,679,402; colonies, 1,262,700; industry and labor, 26,764,217; railways, posts, telegraphs, 255,728,463; war, 67,976,440; gendarmerie, 10,379,460; finance, 24,385,900; agriculture and public works, 30,446,746; repayments, etc., 2,826,000.

The 1914 budget is detailed as follows, in thousands of francs: Revenue—property taxes, 30,362; personal taxes, 27,257; trade licenses, 9500; tax on incomes, 18,000; motor cars, 1500; cinemas, 500; mines, 29; customs, 72,031; excise, 94,703; various, 1652; registration, etc., 49,100; succession, 32,100; stamps, 14,500; fines, etc., 3013; rivers, etc., 3690; railways, 362,300; telegraph and telephone, 23,535; post offices, 27,950; steamboats, 2210; domains, etc., 5590; various, 28,179; repayments, 9609;—total, 807,313. Expenditure—public debt, 217,503; civil list, dotations, 5614; justice, 32,248; foreign affairs, 5127; interior, 7979; sciences and arts, 43,179; industry, 26,873; railways, 246,484; marine, posts, telegraphs, 54,693; war and gendarmerie, 101,096; finance, 26,544; public works and agriculture, 35,139; colonies, 1443; repayments, etc., 2826; total, 806,754.

The total consolidated debt in 1835 was 96,841,080 francs; in 1870, 682,880,914; in 1900, 2,650,898,151; in 1910, 3,703,403,693; on Jan. 1, 1912, the total consolidated debt was 3,734,354,038; on Jan. 1, 1913, 3,739,133,738 francs—219,959,632 francs share of the Netherlands debt at 2½ per cent, and 3,519,174,106 francs loans at 3 per cent. The greater part of the debt was raised for public works, and the interest is more than covered by the revenue from railways alone.

ARMY. With the defeat of the Belgian army and the retreat from Antwerp the forces became disorganized temporarily, yet they gradually came together and the army was increased and reorganized so that it was able to take up a position of defense on the banks of the Yser and became a formidable part of the allied troops. This army was fully armed and equipped and so augmented by volunteers not only from the conquered Belgian provinces, but also by refugees who had gone to England and France at the outbreak of the war. Special training camps were formed in different parts of France where these men were fully trained before they were sent to the front. It was reported that the Belgian army was really increased and with the large number of volunteers enlisted at the training camps it was stated that at the end of the year 1915 this army was greater than ever previously. At the temporary capital of the kingdom at Havre, France, a law was passed providing for compulsory general service which exempted married men and included single men up to the age of 25. No such measure apparently was needed for enlistment was general among the available Belgians. Adequate arms and equipment were provided for this Belgian army, especially for those in the trenches, so that as a fighting force it was in far better shape than it had been to resist the invasion.

GOVERNMENT. The King is the executive, assisted by a ministry of eight members, responsible to a chamber of representatives and appointed by the King. The legislative power is exercised conjointly by the King and a Parliament made up of two houses—a Senate and an elective Chamber of Representatives. The reigning sovereign during the German invasion was Albert, son of the late Prince Philippe of Saxe-Coburg and Gotha, born 1875. Prince Leopold (born 1901) is heir-apparent.

HISTORY

RESTORATION AND RELIEF WORK. The War Relief Commission sent to Belgium in November, 1914, by the Rockefeller Foundation, issued a notable report, Feb. 15, 1915, describing the condition of Belgium, and emphasizing the fact that the chief cause of misery was the sudden suspension of the nation's economic activities. "Essentially the problem is not one of repair, but of liberation. If the paralyzing restrictions imposed by the war were removed to-day, the country would rebound from its helpless inertia tomorrow, resume most of its normal occupations, and soon be able to feed, shelter, and clothe its own sufferers." One of the most serious problems, the report explained, was the destruction of live stock throughout the country, and the unwillingness of the peasants to keep horses and cattle because of the fear that the animals would be requisitioned by the German military authorities. In February an organized effort was begun by the Central Committee for the Agricultural Restoration of Belgium and Northern France to collect seed, stock, etc., to repair the ravages of war. According to the Committee's statement the loss sustained by the rural districts of Belgium aggregated \$280,000,000; of the total loss, the destruction of crops and stock represented more than half. The Belgian and French Ministers of Agriculture accepted proposals made by the Committee to undertake the distribution of gifts to the agricultural laborers of Belgium and France. The International Garden Cities and Town Planning Association in its world-wide conference at London, about the middle of February, suggested a comprehensive scheme, which received the official approval of the French and Belgian governments, for the rebuilding of the country after the conclusion of the war. A unique proposal for the restoration of Belgium was that made by Mr. John Wanamaker, the wealthy American merchant; Mr. Wanamaker proposed that the United States should purchase Belgium from the German government, paying as high a price as \$100,000,000,000 if necessary, in order that American philanthropy might conduct the work of restoring peace and prosperity to the desolate nation. Meanwhile an immense amount of practical relief work was actually being accomplished in Belgium, partly upon the initiative of the German administrative authorities, as will presently appear, and partly by the Commission for Relief in Belgium, which was generously supported by contributions from Belgium and from abroad. The Commission's report, published early in September, recorded the collection and disbursement of fifty million dollars. More than half of the money contributions were made by the Belgians themselves. About six million dollars had been contributed by the United States, in the form of

money, clothes, and food. The German government, it may be noted in this connection, had promised safe conduct to American vessels laden with supplies for the relief of Belgium. The report of the Commission furthermore revealed the fact that in June, 1915, about 2,750,000 Belgians were destitute, and were being supplied with food and clothing in so far as the Commission's resources would permit. Unemployment and destitution were steadily increasing, and the prospects for the future were indeed gloomy. A report of the Rockefeller Foundation, published about the same time as the Relief Commission's report, showed that the expenditure of the Foundation for relief purposes in Belgium had amounted to \$986,000, and that a number of Belgian scientists, formerly professors at Louvain, were receiving moderate stipends to allow them to continue their scientific work in England or America.

THE GERMAN ADMINISTRATION IN BELGIUM. Three features of the German administration in Belgium were specially worthy of note. In the first place, the German Governor-General, General von Bissing, was chiefly anxious to maintain order and discipline—no easy task with a people whose hearts had recently been inflamed by their heroic struggle against the German invader, and whose detestation of "Prussian militarism" and bureaucracy had been raised to the pitch of passion. In consequence, General von Bissing deemed it necessary to employ harsh measures. Each community was held collectively responsible for any disturbance which might occur within its midst, and the fearful punishment which had been meted out to Belgian towns during the German invasion made "collective responsibility" no empty phrase. It is interesting to note that the submissiveness shown by the conquered Belgian population in 1915 was ascribed in German circles to the salutary effect of the stern measures of the preceding autumn, which had struck terror into the hearts of the people. In three separate paragraphs under this article will be found a discussion of the *Treatment of Cardinal Mercier*, the *Case of Miss Cavell*, and the *Bryce Report*, all of which have some bearing upon the disciplinary measures employed by the Germans in Belgium. A second noteworthy feature of the German administration was the endeavor of the German officials generally to coöperate with the various philanthropic organizations for the relief of the distressed population. In March General von Bissing announced that he was doing all in his power to strengthen local self-government and social welfare institutions in Belgium, that the return of immigrants was being encouraged, and that the German Red Cross had been asked to take preventive action against prostitution, infant mortality, and contagious diseases within the country. In April a credit bank was instituted to make cash advances on the requisitions which were being given by the Germans in payment for large quantities of goods then being seized. The refusal of the Belgian Red Cross in the middle of April to enter into a systematic plan for relieving the distress in Belgium brought about the dissolution of the society by decree of the Governor-General, and the appointment of a German officer to supervise the work. In July announcement was made that the American Commission for Relief in

Belgium had concluded an agreement with General von Bissing, whereby all of the wheat and rye crops in the zone occupied by the Germans should be reserved for the needs of the civilian population. Only West Flanders and a part of East Flanders, for obvious reasons, were excluded from this agreement. Ordinarily the crops would be sufficient to supply the country for two months, but with economical use, and with the bountiful supply of seed by the American Commission, Belgium's stock of cereals was expected to last much longer. In the middle of October the Chief of the German Army Staff announced that arrangements had been made to provision 2,000,000 civilians in East and West Flanders. The authorities requisitioned a portion of the cereal and root crops in those provinces, leaving the remainder to be distributed by the American Commission. The Commission undertook to import wheat to supply the deficit, and also to supply bacon, rice, lard, and fodder, for the use of the Belgian civilian population. The third feature of the German administration in Belgium was the attempt to put the occupation of Belgium upon a self-supporting if not a profitable basis. The levy of a heavy tax on absentee (emigrant) landlords, announced in January, and the imposition of a monthly war contribution of 40,000,000 francs, announced November 13, to become effective in December, were calculated to help defray the actual cost of administration. Even more important were the measures taken to make Belgium's industrial resources valuable to Germany. From the formal statement issued March 5, by the Belgian legation at London, the fact appears that more than \$3,000,000 worth of Belgian machinery had been seized by the Germans. In order that there might be a plentiful supply of labor for the construction of arsenals, the operation of mines, and the repair of railroads, General von Bissing issued a decree imposing penalties on Belgians who refused without good reason to resume work in consonance with their former professional training. Any attempt, whether by means of threats, persuasion, or coercion, to hinder persons working for the German authorities, would be severely punished. Destitution itself, if due to stubborn refusal to work, would be treated as a misdemeanor. Furthermore, in order to promote the sale of German manufactures in Belgium, penalties were promulgated against any Belgian who should conspire with others to boycott German goods, or to threaten, blacklist, boycott, or insult users of German goods. For such offenses the penalties might be, at the maximum, two years' imprisonment and a fine of 10,000 marks.

THE GERMAN CHANCELLOR'S STATEMENT. The result of more than a year of German administration in Belgium was strikingly summarized, from the German point of view, by Imperial Chancellor von Bethmann-Hollweg, in his historic Reichstag speech of Dec. 9, 1915:

"In Belgium the economic situation is almost normal. Industry and commerce have been reinvigorated, monetary matters have been regulated, the post office, railways, shipping, and roads are working, the production of coal is rapidly increasing, and last quarter reached nearly three and a half millions of tons. Unemployment is being checked, but it is impossible to bring the labor market to a normal state

because Great Britain is strangling Belgian industry by closing its oversea export. A general obligation to visit schools for instruction in the Flemish language has been introduced."

THE TREATMENT OF CARDINAL MERCIER. Of the several instances of arbitrary conduct on the part of German officials in Belgium, in consequence of which bitter reproaches were directed against the German government by the press of allied and neutral countries, the case of Cardinal Mercier attracted the most general attention, partly because of his conspicuous position, as Cardinal Archbishop of Malines, and Roman Catholic Primate of Belgium, partly because of the high esteem in which he was held by the Belgian people. A trip through Belgium late in the preceding year so deeply touched the heart of the prelate that, in January, 1915, he was moved to write a pastoral letter on the condition of Belgium. The letter was appointed to be read in all the churches of his diocese on Sunday, January 3. Having learned of the cardinal's action, and being informed that the letter was anti-German in tone, the German authorities attempted by force to seize as many as possible of the copies which had been sent to the parish priests. At the same time Cardinal Mercier was made practically a prisoner within the confines of Malines by the authorities, who kept several officers near him at all times. Early reports stated that the cardinal was in actual confinement, but this the German authorities denied, stating at the time that he had merely been requested by the Governor of Malines not to take an attitude which might incite the people to disturb public order. On January 12 King Albert of Belgium sent a personal protestation to Rome asking that the Vatican take action against the incarceration of the cardinal. In a letter which appeared in the newspapers on January 19, the cardinal protested against the action of the authorities, and stated that he was being prevented from traveling freely, notwithstanding the German communication "that the Cardinal Archbishop of Malines has been in no wise hindered in the exercise of his episcopal duties." In answer to a remonstrance from the Holy See the German authorities in the middle of February announced the withdrawal of restrictions upon the cardinal's freedom of communication with the bishops and other clergy of Belgium. The pastoral letter of January 3, which had caused all the trouble, contained the following statement which the Germans considered provocative:

"I have gone through most of the places in my diocese which have been wasted. . . . What I have seen of the ruins and the ashes passes anything that, in spite of my most acute fears, I could ever have imagined. . . . Churches, schools, charitable institutions, hospitals, convents, to a considerable number, are unfit for use or are in ruins. Whole villages have almost disappeared. . . . God will save Belgium, my brothers, we cannot doubt it. Let us say, rather, He is saving her. . . . Is there a single patriot who does not feel that glory has come to Belgium? Which of us would have the courage to tear out the last page of our history? Which of us can look without pride on the splendor of the glory that our murdered country has won?"

THE BRYCE REPORT. Full details of the

shocking outrages alleged to have been perpetrated by the German army during the invasion of Belgium were published in the Bryce Report, May 12, 1915, as the result of a careful investigation conducted by a commission of eminent British jurists under the chairmanship of Viscount Bryce. From the evidence accumulated the commission reached the conclusion that (1) the German troops in many parts of Belgium deliberately organized systematic massacres of the civilian population, and in other places committed isolated murders and outrages; (2) that outrages upon women, the killing of children, and the butchery of innocent civilians attended the progress of the German invasion quite generally; (3) that the destruction of private property and the burning of private houses was not only permitted by the German officers, but in some cases actually ordered by them, careful provision having been made in advance for the incendiaryism which the German troops practiced as part of their campaign of terrorism; (4) that the German troops by interposing civilians between themselves and the enemy's fire, by killing wounded and prisoners, and by abusing the Red Cross, had flagrantly violated the rules and usages of civilized warfare. As a counterblast to the Bryce Report, the German government published a memorandum specifying in detail, with the names of witnesses, the acts of the civilian population—such as throwing boiling water, "sniping off" soldiers, maiming wounded Germans, and murdering officers—which led to the punishment of Belgian towns, including Louvain. Furthermore, the German apologists were supplied with additional material for the justification of Germany by the discovery of secret Belgian diplomatic documents, which, it was claimed, proved that Belgium's fate was deserved, inasmuch as her neutrality had already been surrendered to England.

THE CASE OF EDITH CAVELL. In October, 1915, a new "German atrocity" in Belgium aroused the British public to furious indignation and, to a lesser degree, the public of neutral countries. According to the account of the affair sent by the American minister, Brand Whitlock, to London, and published by the British government, Miss Edith Cavell, an Englishwoman who had been in charge of a training school in Brussels, was accused of utilizing her position as a nurse to assist in the escape of British, Belgian, and French soldiers from Belgium. She had been arrested August 5th; October 11th she was condemned to be executed by a firing squad of German soldiers. Disliking to kill a woman in cold blood, the firing squad had aimed so inaccurately that Miss Cavell was not killed, but only wounded by a single bullet. Thereupon—and this was the circumstance which particularly infuriated the British press—the German officer in charge of the firing squad drew his revolver, put it up to the woman's ear, and deliberately pulled the trigger. In England Miss Cavell was henceforth regarded as a martyr, a sort of British Joan of Arc. A memorial service at Westminster Abbey, attended by Mr. Asquith as well as by representatives of the royal family, was thronged by a vast multitude anxious to do her honor. Plans were made to erect a statue to her memory.

Prince Leopold, thirteen and a half years of age, the youngest son of the King and Queen, enlisted in the war. He joined a famous regiment of the line noted for its heroic defense of Dixmude. On April 8th King Albert celebrated his fortieth birthday among the ruined towns of Flanders, all that remained of his kingdom. Among others, President Woodrow Wilson sent His Majesty greetings on the occasion. Late in May the King conferred the Grand Cordon of the Order of Leopold on Field Marshal Lord Kitchener, British Secretary of State for War.

RELATIONS WITH THE VATICAN. On March 17th Baron van den Heuvel, the Belgian Minister to the Vatican, presented his compliments to the Pope. Pope Benedict, in answering the Baron, referred to the protests which the fate of Belgium already had drawn from him in his Consistorial Allocution of January 22nd, and continued:

"We wish that our dear Belgian children may soon salute the beautiful sun of peace on the horizon of their country. We even desire not to limit ourselves to mere wishes, but for the moment we ask the Belgians not to doubt the benevolence with which we love to surround them."

BENNETT, ARNOLD. See **LITERATURE, ENGLISH AND AMERICAN, Fiction**.

BENSON, RICHARD MEUX. A Church of England clergyman, died Jan. 14, 1915. He was educated at Christ's Church College, Oxford, and was ordained priest in 1849. In 1850-70 he was vicar of Cowley, and from 1870-76 vicar at Cowley-St. John. The founder of the Society of St. John the Evangelist, commonly called the Cowley Fathers, he became its first Superior. His published writings include: *The Wisdom of the Son of David*; *The Final Passover*; *The Life Beyond the Grave*; *War Songs of the Prince of Peace*; and *St. Columba*, a poem.

BERCHTOLD, COUNT. See **AUSTRIA-HUNGARY, History**.

BEREA COLLEGE. An institution for higher education, founded in 1845, at Berea, Ky. The total enrollment in all departments in the autumn of 1915 was 1262. The faculty numbered 95. There were no notable changes in the membership of the faculty during the year, and no noteworthy benefactions were received. The college has an endowment of about \$1,000,000, and a total income of about \$118,000 per year. The library contains 30,000 volumes. The president is William G. Frost, Ph.D., D.D.

BERIBERI. No new theories concerning this disease have been put forward during the past year. An interesting incident which supports the dietary theory was the arrival of a German war vessel, *Kronprinz Wilhelm*, which put into an American port after a cruise of 255 days. A large number of the crew were found by the United States Public Health Service to be suffering from beriberi, and inquiry into their diet revealed the fact that foods having the bases of lime were markedly deficient, fresh meat, white flour, bread and crackers, boiled potatoes, butter, lard, and sugar being the chief articles of food. It is notable that 47 cases

were cured in eight days after a change was made to a diet rich in alkaline ash.

BERMUDA. A group of islands (about 300) lying about 500 miles to the east of Cape Hatteras; a British colony. Area, about 19 square miles; population (1911 census), 18,994 (12,303 colored). Hamilton (the capital) had 2627 inhabitants; St. George's, 1079. During the year ended May, 1912, about 20,000 tourists entered the colony. The mild, equable climate has long made the islands a favorite winter resort. Nearly three-fourths of the area is unfit for cultivation. The remainder is utilized for the production of early spring table crops, for export to the United States. There are no railways. There is a private telephone company, with about 1560 miles of wires. Commerce and finance statistics from 1910-13 are given in the following table:

	1910	1911	1912	1913
Imports	£517,074	£545,540	£637,178	£570,575
Expenditure ..	68,392	90,100	78,210	87,779
Exports	106,508	134,033	116,586	90,695
Revenue	78,593	79,248	83,629	80,576
Shipping*	688,315	700,869	1,273,666	1,255,866

* Tonnage entered and cleared.

Customs revenue (1913), £64,711. The Governor, Lieut.-Gen. Sir George Mackworth Bullock, was appointed April 4, 1912.

BERNSTORFF, COUNT VON. See **UNITED STATES AND THE WAR**.

BESSEY, CHARLES EDWIN. American botanist and educator, died Feb. 26, 1915. He was born in Milton, Wayne County, Ohio, in 1845, and graduated from the Michigan Agricultural College in 1869. In 1872 and 1873, and in 1875 and 1876 he studied at Harvard University under Dr. Asa Gray. Afterwards taking a post graduate course at the State University of Iowa, he received thence the degree of Ph.D. From 1879-84, professor of botany at the Iowa Agricultural College, he was acting president of that institution in 1882, whence he went as professor of botany to the University of Nebraska in 1884, and there, from 1888-91, he acted as chancellor of the university, as he did again from 1899-1900, and in 1907. In 1909 he was appointed dean of that institution and continued in this capacity until his death. From 1880 to 1897 he was botanical editor of the *American Naturalist*, and acted in the same capacity for *Science* from 1897 through the remainder of his life. From 1910-11 he was president of the American Association for the Advancement of Science; and he was an official or member in many other scientific societies. He received the degree of LL.D. from Iowa College in 1898. His published writings include: *Geography of Iowa* (1876); *Botany for High Schools and Colleges* (1880); *The Examination of Botany* (1884); *Elementary Botany* (1904); *Outlines of Plant Phyla* (1909, 1911, 1912, 1913). He was one of the most eminent botanists in the United States.

BETBEDER, ONOFRE. An Argentine vice admiral, died Jan. 24, 1915. He was born in 1862, and at an early age entered the naval service, after graduation from the naval academy at Buenos Aires in 1880. For two presidential terms, beginning in 1898, he was Secretary of the Navy. He was made a rear admiral in 1904. Of the Argentine commission, which since May,

1911, has been in New York City supervising the construction of two dreadnoughts for the Argentine navy, he was president. In 1912 he was made vice admiral.

BETHMANN-HOLLWEG, THEOBALD VON. See GERMANY, *History*, *passim*.

BIBLE SOCIETY, AMERICAN. The society issued during the year ending March 31, 1915, 6,406,323 volumes. Of this number, 2,426,418 were issued from the Bible House in New York, and 3,979,905 from foreign agencies of the society. The work of the society is carried on in over fifty countries, on five continents, and among the islands of seven seas. It maintains nearly 2000 distributors. An important part of its work is the revising and improving the versions of the Scripture, already published, and the translation of the Bible into new languages and dialects. Its home agency work is among the colored people of the South, and among immigrants in the Northwest, in the South Atlantic States, and in other sections. It also prosecutes work among the foreign population of New York. The distribution of the Bible in the United States in the year ending March 31, 1915, was 2,183,783 volumes. In addition, 35,000 volumes were sent to Porto Rico, Hawaii, and the Philippines. The total appropriations for foreign agencies for 1914-15 amounted to \$249,400, and for home agencies \$94,300. The ninety-ninth annual meeting of the society was held on May 13, 1915. The officers of the society are: James Wood, president; Rev. John Cox and Rev. William I. Haven, secretaries; Rev. Henry O. Dwight, recording secretary; and William Folk, treasurer.

BICYCLING. See CYCLING.

BILLIARDS AND POOL. William F. Hoppe, champion of the world at all forms of balk-line billiards, showed in 1915 that he had lost none of his amazing skill in making the ivories obey his slightest whim. In the first professional handicap tournament at 18.2 balk-line ever held in New York City, Hoppe allowed some of the most prominent players in the United States 200 points and yet went through the severe test without losing a match. Furthermore, he established a new world's record high run of 308 points in one game. Welker Cochran, of Wisconsin, finished second in this tourney, Hoppe being the only player to defeat him.

Alfredo de Oro, who regained the three-cushion title by the withdrawal of William Huey, the champion, proved himself king of this type of billiards, setting up a new world's record by running 50 points in 35 innings.

J. Mayer, of Philadelphia, won the amateur class A championship in a tournament held at Philadelphia, scoring 6 victories in 6 games. J. Poggenburg finished second with 4 games won and 2 lost.

In English billiards, Melbourne Inman, English champion, defeated John Montgomery by a score of 3000 to 605, Inman agreeing to play 3000 points against Montgomery's 1000.

J. H. Shoemaker won the amateur pool championship tournament held in New York City, making a clean sweep of the six games. E. F. Reynolds was second with 5 victories and 1 defeat.

BLACK, JOHN CHARLES. American soldier and public officer, died Aug. 17, 1915. He was born in Lexington, Miss., in 1839, and educated at Wabash College. At the outbreak of the Civil War, enlisting as a private, on the expiration of his three months' service, he joined the thirty-seventh volunteers as a major; was promoted to be lieutenant-colonel, and to be colonel in 1862, for bravery in the battle of Prairie Cross, Ark., in which he was severely wounded. In April, 1868, at the age of twenty-six, he was brevetted brigadier-general of volunteers for gallantry in Blakley, Ala. Although his health had been undermined by severe wounds, at the close of the war he settled in Danville, Ill., to finish the study of law, and soon thereafter began to practice in that city, entering actively, also, into politics. In 1866, 1880, and 1884 he was the Democratic candidate for Congress. Nominated for lieutenant-governor in 1872, and for United States Senator in 1879, he was in both cases defeated. In 1884 he declined the nomination for Governor of Illinois. The office of commissioner of pensions, to which President Cleveland appointed him, he held for four years. From 1893-95 he was representative at large for Illinois, and from 1895-99 he was United States district attorney of the northern district of that State. Appointed civil service commissioner in 1903, he became in the following year president of the Civil Service Board, holding that office until June 10, 1913. In 1903-04 he was commander-in-chief of the Grand Army of the Republic.

BLUE SKY LAWS. Following extensive speculation in oil and gas stocks in 1905-10, the State of Kansas enacted a law in 1911 requiring dealers in investment securities to be licensed by the State and to file with the State Banking Department information regarding stocks and bonds sold by them. This led some 20 States to enact laws all designed to prevent the sale of fraudulent securities to an unsuspecting public. These laws are known as "blue sky" laws, owing to a remark of the Kansas bank commissioner that certain companies were capitalizing the blue sky. Owing to the extremity to which the proposed regulation was carried, the Investment Bankers' Association began a systematic effort to bring about such legislation as would not impede the operations of dealers handling legitimate stocks but would secure the punishment of fraudulent operations. This effort was seconded by the National Association of Supervisors of State Banks, which appointed a "Blue Sky Committee" in 1914, which coöperated in carrying through a less restrictive type of law. This committee drew up a model law based upon Federal postal laws and designed to make fraud punishable without introducing close supervision by an executive or commission. By the close of 1914 various of these laws had been brought before the courts to test their constitutionality. The most impor-

tant of these decisions in 1914 declared the Michigan Blue Sky Law unconstitutional, because of interference with interstate commerce and with the individual's right of free contract, and also because of an undue extension of the police power. Subsequent decisions in the case of the Iowa and West Virginia statutes and the 1915 law of South Dakota, as also in the case of the laws of Arkansas and Kansas, showed unanimity of opinion among 11 Federal judges. In a few cases the laws have been sustained either because their scope was narrow, or because the plaintiff was disqualified to bring suit. Thus the laws of Arkansas, Florida, and Montana were upheld since they applied solely to promotion and get-rich-quick concerns, and did not affect the ordinary dealer in securities. The South Dakota statute was enjoined on November 18th by the Federal Court; the constitutionality of the revised Michigan law was argued on November 13th; and at the close of the year the Ohio law was also before the court. It was expected that the South Dakota case would be appealed to the United States Supreme Court.

During 1915 bills for the enactment of some sort of Blue Sky Law were introduced into nearly every State Legislature, but no State which had not previously passed a law on this subject enacted legislation in 1915. In the following States, however, laws were reenacted or revised on account of previous judicial decisions: Arkansas, Iowa, Kansas, Michigan, North Dakota, South Dakota, and West Virginia. The new Michigan law differed immaterially from the one declared unconstitutional, and apparently is to be carried through the courts to the United States Supreme Court for the final adjudication of the principles involved.

BOARDMAN, GEORGE NYE. American theologian and educator, died Nov. 9, 1915. He was born in Pittsford, Vt., in 1825; graduated from Middlebury College in 1847, and from Andover Theological Seminary in 1852. He was ordained to the Congregational ministry in 1854. From 1853-59 he was professor of rhetoric, English literature, and sociology at Middlebury College. From 1859-71 he was pastor of the First Presbyterian Church at Binghamton, N. Y. A year later he was appointed assistant professor of systematic theology at the Chicago Theological Seminary, holding this position until 1893, when he became professor emeritus. He was the author of *Lectures on Natural Theology; The Will and Virtue; Congregationalism, A History of New England Theology*. He received honorary degrees from the University of Vermont, Lafayette College, and Middlebury College.

BOHEMIA. See AUSTRIA-HUNGARY.

BOILERS. The construction of boilers during the year 1915 involved the use of larger units, higher steam pressure, and a greater output per square foot of heating surface, without undue loss of efficiency. In fact in many plants it was realized that by improving operating conditions, better stoking, both automatic and manual, with proper records and indicators, increased economy could be secured. Larger boilers, such as units of 1200 boiler horse power capacity, were coming into service rather generally for large electric central stations. The Commonwealth Edison Company of Chicago had several with a heating surface of 12,200 square feet each, and the Connors Creek Edison station

had one with 23,650 square feet. The latter boiler was regarded as of unusual size and not likely to be duplicated soon.

With boilers designed for such service as 350 pounds pressure and 200 degrees superheat, as in the case of new units for the Public Service Company of Northern Illinois, mechanical engineers were considering the possibility of employing from 600 to 700 pounds, or even 1000 pounds per square inch pressure, and there was a general tendency to consider that the time had arrived for using high pressure in excess of the 200 pounds or so previously employed. Furthermore, there was a development in the output of steam per square foot of heating surface, evaporations of 5, 6, and 7 pounds per square foot were by no means uncommon during the year, and there were instances where this had been raised to 10, 12, 14, and even 16 pounds, with maintenance of excellent efficiency. As a result of such work and the use of economizers in connection with boilers, engineers looked for developments of noteworthy character in the near future.

Boiler explosions to the number of 1300 or 1400 occur annually in the United States, with a death roll of from 400 to 500 persons, and a list of injured of from 700 to 800, with a loss of property of over \$500,000.

The Council of the American Society of Mechanical Engineers, at a meeting held in February, 1915, approved the report of the Boiler Code Committee, which was established on Sept. 15, 1911, "to form standard specifications for the construction of steam boilers and other pressure vessels and for the care of the same in service." This committee included seven members—a consulting engineer, a former member of the Massachusetts Board of Boiler Rules, two professors in engineering, two boiler manufacturers, and one insurance engineer. The Massachusetts and Ohio rules which were considered the best in use were taken as a basis, and from these a preliminary draft was prepared and widely circulated for criticism among those directly interested. This draft received repeated revision, and practically all interests concerned, especially the boiler manufacturers, desired more stringent rules than those arranged for Massachusetts and those prepared originally by the committee.

This report and the accompanying code deals in detail with specifications for boiler steam and boiler tubes, uniform rules for safety valves, fire tube and water tube boilers, steam and hot water heating boilers. It combines practice with theory so that all interests from the manufacturer to the user are protected.

It was the design of the society that this code should form the basis for uniform State and municipal legislation, and it was adopted by the officials in charge of steam boiler inspection in the States of Ohio, Indiana, and the cities of Detroit and Chicago. In Pennsylvania, Wisconsin, and California, the State authorities expressed their satisfaction with the code and their intention to put it in force later. The American Uniform Boiler Law Society, formed of representatives of the principal trade and technical organizations that cooperated in the drafting of the code, was actively at work during the year, and bills for the adoption of the code were to be introduced in the 1915-16 sessions of the Legislatures of Georgia, Kentucky,

Louisiana, Massachusetts, New York, New Jersey, Rhode Island, South Carolina, and Virginia. In fact it was proposed to secure legal adoption for the code in all the States of the Union, as it would result in great benefits to boiler makers and users, tending toward greater safety and engineering efficiency. The committee advocating the adoption of the code contained representatives of the boiler manufacturers, the water tube manufacturers, locomotive manufacturers, steam shovel manufacturers, and hoisting engine manufacturers.

One of the notable publications of the year was a new edition of *Steam Boiler Economy*, by William Kent. This deals with the most modern practice and is considered a valuable contribution to the literature on this subject.

The number of boiler failures in the United States for the year ending June 30, 1915, was 371. In these, 127 persons were killed and 317 injured. In 107 reports of property losses the damage was estimated at \$155,325, or an average of about \$1450. In the strictly power-plant failures, 51 were due to defective tubes, 12 to cast iron headers, 23 to blow-off pipes, and 10 caused by over pressure.

BOKHARA. A Russian vassal state in central Asia. Estimated area, 83,000 square miles; estimated population, 1,500,000. Capital, Bokhara, with about 75,000 inhabitants. Other towns are: Karshi (25,000), Hissar, Khuzar, and Shahr-i-Zabz (about 10,000 each). Moham-medanism prevails. Russians in the country number upwards of 10,000. The town of Bokhara is only a few miles from the line of the Trans-Caspian Railway, which traverses the country; the length of the railway within Bokhara is 186 miles. The ameer in 1915 (from Jan. 6, 1911) was Sayid-Mir-Alim Khan.

BOLIVIA. An interior South American republic. The seat of government, executive and legislative, is La Paz, where also the members of the diplomatic corps are resident; the Supreme Court sits at Sucre.

AREA AND POPULATION. The area has been officially estimated at 1,379,014 square kilometers (532,437 square miles) or, including disputed territory, 1,458,034 square kilometers (562,047 square miles). There has long been a boundary dispute with Paraguay; in 1915 a protocol relating thereto was signed extending for one year the protocol of 1913. The population, according to the 1900 census, was 1,744,568, of whom 50.9 per cent were Indian, 26.7 mestizo, 12.7 white, 0.21 negro, and 9.4 unclassified. An estimate of the population in 1914 was 2,520,540. It is not unlikely that this figure is somewhat too large; a calculation published in 1915 was 2,492,377. The great elevated plateau of Western and Central Bolivia contains the larger part of the population, both urban and rural. Estimated population of the larger towns: La Paz, about 95,000; Cochabamba, 30,000; Sucre, Oruro, and Potosí, each about 25,000; Santa Cruz, 21,500; Tarija, 8000.

EDUCATION. There are universities at La Paz and Sucre, and secondary schools (public, private, clerical) in the larger towns; primary instruction is free and nominally compulsory, but a large part of the people are illiterate. Roman Catholicism is the established religion. By a law of 1912 marriages must be celebrated by civil authorities.

PRODUCTION AND COMMERCE. Agriculture is

important only to meet local needs and not as a factor in the foreign trade. The estimated area under cultivation is about 4,940,000 acres, producing corn, barley, rice, potatoes, beans, etc.; other products are coffee, cacao, coca, and quina. Live stock, as reported for 1912, included 98,846 horses, 44,584 mules, 172,959 asses, 734,286 cattle, 1,499,114 sheep, 467,950 goats, 414,047 llamas, 112,033 alpacas, and 114,146 swine. Large quantities of rubber are gathered in the northern forests; rubber stands next after tin in value among the exports, and in the exportation of rubber Bolivia ranks next to Brazil among South American countries. Bolivia derives its prosperity chiefly from the production of tin; it ranks second only to the Federated Malay States among the tin-producing countries of the world. Other metals produced in considerable quantity are silver, copper, bismuth, and gold.

Imports and exports have been valued as follows, in thousands of bolivianos:

	1909	1910	1911	1912	1913	1914
Imports	36,937	48,802	58,371	49,509	54,763	
Exports	63,764	74,567	82,631	90,123	95,722	

The principal imports are cotton and woolen goods, provisions, machinery and hardware, wines and spirits, and apparel. The chief exports, valued in thousands of bolivianos, were as follows in 1911 and 1912, respectively: tin, 52,640 and 60,238; rubber, 18,921 and 15,509; silver, 4588 and 4308; copper, 1427 and 3389; bismuth, 2218 and 2150; gold coin, 1297 in 1912; coca, 511 and 736; wolfram, 231 and 520; silver coin, 791 and 432. Imports from and exports to Germany in 1912 were valued at 16,514 and 11,201 thousands of bolivianos; the United Kingdom, 9070 and 66,954; the United States, 4595 and 392; Chile, 3982 and 850; Peru, 3781 and 954; Argentina, 3029 and 698; Belgium, 2571 and 3639; France, 2436 and 5472. The tin export amounted in 1912 to 38,378 metric tons; rubber, 4079; silver, 124; bismuth, 387; wolfram, 472.

COMMUNICATIONS. In the latter part of 1913, railways in operation aggregated 1292 kilometers (803 miles), distributed as follows: Antofagasta-Oruro (without branches), 922 kilometers, the Bolivian section being 482 kilometers; the branch line Uyuni-Huanchaca, 38 kilometers; Viacha-Oruro, 202 kilometers; Guaqui-La Paz, 98 kilometers; the tramways, Cochabamba-Vinto-Cliza, 57 kilometers; Río Mulatos-Potosí, 174 kilometers; Arica-Alto de La Paz, 439 kilometers, the Bolivian section being 233 kilometers; branch from this last line to Corocoro, 8 kilometers. Lines under construction aggregated 605 kilometers (376 miles). Surveys had been made for a line from Santa Cruz to the eastern frontier at Puerto Suárez (683 kilometers), and for one from Tupiza to the Argentine frontier town of La Quiaca (93 kilometers). The construction of the latter line and the completion of the line from Uyuni to Tupiza was to provide a new through rail route from the Atlantic Ocean to the Pacific. It was announced that the line from Uyuni, a station on the Antofagasta and Bolivia Railroad, which had been under construction in a southeasterly direction towards Tupiza, was to be extended to the present northern terminus to the Argentine railways at La Quiaca, on the frontier directly south of

Tupiza. Work on the proposed railway was begun during the year.

The principal line is the one extending from the Chilean port of Antofagasta to the frontier town Ollagué (440 kilometers), and thence through Uyuni, Río Mulatos, Challapata, Poopó, and Machacamarca to Oruro (482 kilometers). There is connection at Oruro for Viacha (202 kilometers), which is also on the Guaqui-La Paz line and the line from Arica; the distance from Viacha to Alto de La Paz is 23 kilometers, and thence by electric to La Paz, 8 kilometers. The distance from Viacha to Guaqui, on Lake Titicaca, is 65 kilometers. Guaqui has steamer connection with Puno, on the Peruvian shore, whence there is rail communication with the Peruvian port of Mollendo. The distance from La Paz to Mollendo is 861 kilometers, from La Paz to Arica 447 kilometers, and from La Paz to Antofagasta 1155 kilometers. These lines reach very great altitudes; for example: La Paz, 3636 meters; Alto de La Paz, 4089; Viacha, 3919; Corocoro, 4056; Oruro, 3703; Challapata, 3708; Río Mulatos, 3806; Uyuni, 3660; Ollagué, 3696; Tiahuanaco, 3825; Guaqui, 3813; and in Peru, Puno, 3814; Santa Lucía, 4038; and Crucero Alto, 4470.

There is telegraph communication with foreign countries and between the principal towns, including all the departmental capitals. The length of line in 1912 was 6133 kilometers; wire, 8951; offices, 194. The wireless telegraphy system includes stations at La Paz, Villa Beni, Trinidad, Cobija, Santa Cruz, Yacuiba, and Puerto Suárez. Post offices number about 200.

FINANCE. The standard of value is gold. The monetary unit is the boliviano, par value 38.932 cents, or 12.5 bolivianos to the pound sterling. A statement of Bolivian revenue published in 1915 showed that the revenue increased from 3,624,200 bolivianos in 1890, to 4,115,700 in 1895, 6,462,931 in 1900, 7,854,698 in 1905, 12,583,232 in 1910, 20,164,602 in 1912, and 22,018,874 in 1913. The budget for the fiscal year 1915 showed estimated revenue and expenditure of 25,263,500 and 24,630,702 bolivianos, respectively. The estimated revenue comprised: import duties, 9,975,850 bolivianos; export duties, 4,825,000; taxes, 6,753,000; other receipts, 3,709,650. The larger estimated disbursements were: for the ministry of finance, 9,369,820 bolivianos; war and colonization, 5,714,675; interior and fomento, 3,771,326; public instruction and agriculture, 2,562,468. Bolivia had no foreign debt until 1908. The foreign debt, as stated for June 30, 1913, was: 1908, 5,663,006 bolivianos; 1910, 18,218,250; 1913, 12,500,000. Internal debt, 5,298,846 bolivianos; floating, 8,100,694.

GOVERNMENT. The executive power is vested in a President who, with two Vice-Presidents, is elected by direct vote for four years, and ineligible for the next term. There is a Cabinet of six ministers. The legislative power rests with a Congress of two houses, the Senate and the Chamber of Deputies. Senators (16 in number) are elected for six years, and deputies (75) for four years, all by direct vote. The President in 1915 was Ismael Montes, who succeeded Eliodoro Villazón on Aug. 14, 1913. First Vice-President, Juan M. Saracho; second Vice-President, José Carrasco.

HISTORY. *Internal Conditions.* Bolivia, on Dec. 31, 1914, declared a 90 day moratorium, made necessary by the scarcity of money in the

country. In March the moratorium was extended till the end of December, 1915. The European war proved very disastrous for Bolivia, causing great reductions in her exports and revenues. The estimated revenues for 1915 were 16,985,000 bolivianos, or in American money, \$6,607,165, while the expenditures were estimated at 21,453,938.32 bolivianos, or \$8,345,582. This meant a deficit of more than \$1,600,000, which would have to be made up by a 30 per cent reduction of a majority of items in the budget. The announcement was made in July that Bolivia would begin to work the famous copper mines in the vicinity of Corocoro in order to supply Europe with copper bullion. These mines had been lying idle for years owing to the low-grade copper which they produced. In July the Bolivian government announced that the exports for 1914 had totaled 63,000,000 bolivianos, of which Great Britain had secured commodities worth 51,000,000 bolivianos, Germany 3,000,000, France and the United States 1,000,000 each. Early in August the permanent construction work on the railway between Quiaca and Tupiza was begun by the French company which held the contract. This railway had long been needed to facilitate international trade between Bolivia and Argentina and to give an outlet by rail from La Paz and other connecting points to Buenos Aires.

Relations with the United States. On May 14th, Bolivia negotiated a loan of \$1,000,000 through the National City Bank of New York. This loan was expected to prove of valuable assistance in overcoming financial difficulties caused by the European war. The country also took part in the Pan-American Financial Conference in May, and was one of the nations which recognized Carranza as provisional president of Mexico in October. See **INTERNATIONAL PEACE AND ARBITRATION.**

BOLL WEEVIL. See **ENTOMOLOGY.**

BONE BLACK. See **CHEMISTRY, INDUSTRIAL.**

BOOTS AND SHOES. During 1915 the boot and shoe industry, as well as the leather business generally, felt the effects of the European war. The United States exported leather to nations from whom once it had imported, while there was a great increase of export business to British colonies, South America, South Africa, East Indies, and the Dutch Indies, not to mention military shoes for the fighting armies. It was estimated at the end of the year that the United States had shipped some 15,000,000 pairs to Europe for the armies from the outbreak of the war. The boot and shoe business was somewhat dull and depressed until the last quarter of the year; nevertheless, prices for everything, from raw materials to finished products, increased. Foreign competition was largely eliminated, so that the American manufacturer was protected by a wall more effective than any tariff. One feature of the year's domestic business was the large number of styles in footwear, and these styles changed very rapidly. Considerable use was made of various kinds of cloth and of colored leathers ranging from white to bronze, blue, and other shades, for the entire shoe as well as for ornamental tops, with white being in strong demand for uppers as well as independent gaiters. The change of fashion in women's clothing, whereby short and wide skirts were adopted in the autumn of 1915, put increased emphasis on ornamental footwear, and

also had its effect on the manufacturing industry.

An important event of the year was the injunction which was issued in the United States District Court by Judge Dyer against the United Shoe Machinery Company, which prevented leasing of new machines, and made invalid leases of all machinery of the company at work in shoe factories. This injunction, however, was suspended by the United States Circuit Court somewhat later, and the issue was to be tried as an equity proceeding to determine what might be legally done under the terms of the Clayton Law.

An examination of labor conditions in the shoe factories of Massachusetts, made by the United States Bureau of Labor, and published during the year, revealed the fact that in this State some 80,000 workers were employed in the industry, or nearly half of the shoe workers in the United States. About 28,000, or about 35 per cent of this number were women, and in active periods of the industry over 40 per cent earned more than \$10 per week, being as a group the highest paid female help in industrial life. That 60 per cent earned less than \$500 a year was another finding in this investigation.

Shoe manufacturing conditions in Europe also were naturally greatly disturbed by the war. In Great Britain the tanneries were being operated by the War Office, and large numbers of boots were being turned out by the various manufacturers. Towards the close of the year the British War Office was securing bids for the Italian army. In Germany the War Leather Company regulated almost the entire hide, leather, and shoe business of Germany, and the maximum prices for these products were fixed by German authorities. In Austria government regulation was also in force, while shoe manufacturers in Hungary labored under hard conditions, as they were required to turn out monthly 80,000 pairs of military shoes to the government at prices fixed by contract, which with the prices of raw materials permitted little if any profit.

BOSNIA AND THE HERZEGOVINA.

Provinces, formerly Turkish, annexed to the Austro-Hungarian monarchy, Oct. 5, 1908. The provinces are administered by a bureau of the common Austro-Hungarian ministry of finance. There is a diet, directly elected, whose legislation is subject to Austro-Hungarian veto. The seat of local government is Sarajevo, in Bosnia. Area: Bosnia, 16,239.4 square miles; the Herzegovina, 3528.5; total, 19,767.9 (somewhat more than the combined area of New Hampshire and Vermont). Population, according to the census of Oct. 10, 1910: Bosnia, 1,631,006; the Herzegovina, 267,038; total civil population, 1,898,044; in addition, military population, 33,785; total, 1,931,802, as compared with 1,591,036 in 1905. Estimated population at the end of 1912, 1,962,411, of whom 626,649 Mohammedan, 856,158 Serbian Orthodox, 451,686 Roman Catholic, 8605 Greek Catholic, 6734 Protestant, and 12,798 Jewish. The larger towns, with 1910 population: Sarajevo, 51,919; Mostar (in the Herzegovina), 16,392; Banjaluka, 14,800; Tuzla, 11,333; Bjelina, 10,061; Srebrenica, 7215; Breka, 6647; Travnik, 10,061. In 1912, marriages numbered 16,363; births, 81,994 living and 178 still; deaths, 48,416.

In 1912 there were 544 elementary schools, 6

gymnasias, 2 realschulen, 3 training colleges for teachers, 11 advanced schools for girls, and 9 commercial schools, besides a number of other technical and professional institutions. In addition, there are numerous Mohammedan schools.

The soil is fertile and of the population in 1910 nearly 88 per cent were returned as agricultural, but nevertheless agriculture is not highly developed. Of the total area, nearly 50 per cent is under forest. The more important crops are corn, wheat, barley, oats, rye, potatoes, tobacco (a government monopoly), flax, hemp, and fruits, especially plums. Sugar beets are cultivated, and there is a sugar factory at Usora, near Doboj. The timber industry and cattle and sheep raising are important. According to the 1910 census, there were 221,981 horses, 393 mules, 6377 asses, 992 buffaloes, 1,308,930 cattle (cows, 400,986), 1,393,068 goats, 2,499,422 sheep, 527,271 swine, 2,230,510 fowls, and 195,204 beehives. Minerals are abundant, including lignite, iron, manganese, copper, and chrome ore. At the end of 1912, the length of railway in operation was 1912 miles; telegraph line, 1972 miles, with 4193 miles of wire. Post offices numbered 240. The budget for 1913 showed estimated revenue and expenditure of 92,997,594 and 92,987,887 kronen, respectively.

BOSTON UNIVERSITY. An institution for higher education, founded in Boston in 1869. Number of students in all departments in the autumn of 1915 was 2450. The faculty numbered 176. Prof. Emil Carl Wilm succeeded Benjamin W. Van Riper in the department of philosophy. The total benefactions received by the university during the year amounted to \$17,000. The productive funds amounted to about \$1,000,000, and the total income to \$263,350. The library contained 63,000 volumes.

BOTANY. Aside from the usual meetings of botanical organizations during the year, a Western Branch of the American Phytopathological Society was organized at Corvallis, Ore., Dec. 29, 1914. Preliminary plans were also made for the formation of the American Ecological Society to be affiliated with the American Association for the Advancement of Science.

Among botanists of note who died in 1915 were: Dr. C. E. Bessey, of the University of Nebraska; J. M. Bailey, colonial botanist to the Queensland government; William Barbey, Swiss botanist associated with Boissier; Dr. E. L. Greene, for many years associated with the University of California and later with the United States National Herbarium; J. Medley Wood, director Natal Botanic Garden; R. H. Lock, of the Ceylon Botanic Gardens, known for his contributions to Mendelism; and Edouard Prillieux, the well-known French phytopathologist. Dr. C. H. Peck, State botanist of New York since 1883, has retired from official life, as has also George Massee, who for many years was at the head of the department of cryptogamic botany at Kew. Dr. J. C. Arthur, botanist of the Indiana Agricultural Experiment Station, retired after 27 years' service at that institution.

The quarantine against certain counties in Maine and New York on account of the presence of the potato powdery scab (*Spongospora subterranea*) was withdrawn Sept. 1, 1915, and the foreign quarantine on Dec. 8, 1915, it having been determined that soil conditions elsewhere in the United States make it unlikely that the disease will spread and become troublesome.

The regulations concerning black scab or wart are continued. The citrus canker situation continues threatening in Florida and elsewhere. The importation of all kinds of citrus trees into the United States is now prohibited. Largely on account of the citrus canker, the Legislature of the State of Florida has provided for a Plant Board which is charged with the control of all plant diseases and insect pests.

Botanical workers along taxonomic lines have been unusually active, many floras, monographic studies, and lists of new species having been issued. Mez and his students have applied the methods of serum diagnosis to plants and found some interesting results which they claim can be utilized in the determination of the phylogeny of the higher plants. In ecology and plant geography, a number of contributions have appeared in this country, among which Harshberger has given the results of an ecological study of Southern Florida and of Nantucket Island; Harper, of Northern Florida; Nichols, of Connecticut; Crouch, of sand dunes on the coast of Southern California; and Rigg, of sphagnum bogs in Alaska.

PLANT BREEDING. Scientific investigations of various phases of plant breeding are receiving the attention of many workers. The question of mutation in *Eurothera* is still vigorously discussed. De Vries claims an examination of the original specimens of *Eurothera lamarckiana* shows they are identical with the forms now common on dunes near Liverpool and elsewhere. Bartlett has offered additional evidence of mutation in *Eurothera*, and has described what he terms mutation in mass in *Eurothera reynoldsii*. Davis, from a study of a large number of hybrids, found in the second generation forms agreeing with *Eurothera lamarckiana*. On the other hand, Jeffry has called attention to morphological objections to the mutation theory. Gates claims previous crossings are responsible for the germinal conditions which have resulted in the mutations of *Eurothera lamarckiana*. He also claims that mutations furnish the material for true evolution. Shull has reported negative correlations in *Eurothera* hybrids. Two types of changes, or mutations, are described by Stout as having appeared in *Coleus* grown vegetatively for six generations. Kearney has reported on the behavior of Egyptian cotton, which is said to exhibit tendencies to mutation. Mayer has continued the studies begun by Emerson on albinism in maize, and has found two types of albinism which are recessive to normal green color. Hayes has described additional mutations in tobacco, and East has reported on self-sterility in some *Nicotiana* hybrids. Belling has described the mode of inheritance of semisterility in certain hybrids of *Stizolobium*. Tammes suggests that the failure of flax hybrids to segregate according to the usual Mendelian expectancy is due to the low germinating power of seed of white-flowered plants. Roemer claims there is no essential difference between inheritance of morphological and biological characters, and that the capacity for production can be utilized in plant breeding experiments. MacDougall has continued his experiments which show the germ plasma of plants can be profoundly modified by various treatments.

PLANT PHYSIOLOGY, ETC. The attention of many histologists has been recently given to the presence and function of chondriosomes. Guil-

liermont claims they are the precursors of leucocytes, confirming the conclusions of Pensa and others, while Cavers says it yet remains to be shown that they are really cell organs. Studies in antagonisms between various salts in solutions continue to receive the attention of plant physiologists, and Stiles, Osterhout, Plate, and others have given the results of their investigations. Czapek claims that living protoplasm must be considered as a colloidal emulsion in hydrocolloidal media which contain proteins and mineral salts. Osterhout, from experiments with methyl green and other colors acted upon by sunlight, found formaldehyde was liberated, and hence he concludes that artificial photosynthesis has not been proven. Fincke has been unable to detect the presence of formaldehyde in plants as claimed by others. Moore believes iron in a crystalloidal or colloidal form is present in the chloroplasts of green plants. In its absence no chlorophyll is formed, although iron is not present in the coloring matter. Keegan, from an extensive review of literature, concludes that Grafe's claim that there is no specific chromogen for anthocyanin is incorrect. Moreau claims anthocyanin is of mitochondrial origin, Löwischin, that it is synthesized by the nucleus from organic materials furnished by the plant, and Czartowski, that its development may be favored by lowering the nitrogen content. Everest claims anthocyanins always occur as glucosides, and that they exhibit different colors according to the media. Kisselew confirms Fischer's claim of accelerated growth in atmospheres containing increased carbon dioxide content. West has given a review of the literature of the chemistry of plant pigments other than chlorophyll. Iwanowski claims the yellow coloring matter associated with chlorophyll acts as a screen, protecting chlorophyll against the injurious violet rays of light. Hall, Armstrong, and others claim the soluble sap pigments in plants are formed by the oxidation of colorless chromogens through the agency of oxidases. Loeb and Wasteneys have shown that light response is the same in plants and animals, and Bose claims the transmission of excitation is essentially the same in both. Schmidt, from a study of the effect of light of different wave-lengths on plants, concludes that the blue rays are more active than usually reported. Ultraviolet rays were found by Stoklassa to exert a marked influence on the development and activity of chlorophyll-bearing organs. Dangeard found that different plants varied in respect to the penetration of violet and ultraviolet rays. The stimulating effect of high frequency electric currents is due to the oscillating field and not to the heat produced, according to Homberger. Carl found the injury to plants by the mercury vapor lamp was due wholly to the chemical activity of the ultraviolet rays. Bovie described the effect of Schumann rays on the activity of protoplasm. Miege and Coupé found the morphology and structure of plants were influenced by X-rays, the growth of some being increased with the strength and frequency of the applications. Sutton reported gains in the growth of rape stimulated with radio-active ores in 1914, but in 1915, experiments with radium bromide gave injurious effects. Rusby claims radio-active earths increased the growth of many species of plants, and Bastian found similar results. Molisch, however, reports the stimulating effect of radium emana-

tions not equal to that induced by means of warm water.

MISCELLANEOUS. The effect of smoke and vapors on vegetation continues to occupy the attention of many investigators. Crowther and Steuart found leaves at all stages of growth subject to injury by town smoke, conifers more than others. Wisliczenus and others claim the injury is due not to the carbon and insoluble salts present in smoke, but rather to the sulphur compounds, especially the sulphites and sulphides. Ewart believes the injury to plants by coal gas and tar vapor is increased by heat and insolation. Harvey and Rose have found the odorous constituents of coal gas are only slightly toxic to plants, while the inodorous, as ethylene, are highly injurious. Lieske reports a group of aerobic bacteria which are able to assimilate carbon dioxide from the air and utilize its energy. Otis, from a study of the transpiration of submerged plants, has accumulated data showing what plants may be allowed to grow in storage reservoirs and what ones should be excluded. Dorsey has found that sterility in grapes is due to functionless pollen rather than to the pistils. Crocker and Graves claim there is a close relation between the time and temperature required to coagulate the proteins in seeds and the duration of their vitality. Howard has published the results of an extended investigation on the rest period of plants. Withers and Carruth have concluded that the poisonous principle in cotton seed is gossypol, first isolated by Marschlewski. Brenchley takes exception to the claim that organic plant poisons are stimulating when present in very small quantities, and she has shown many exceptions to this hypothesis. Skinner has found salicylic aldehyde, a reputed soil constituent, is injurious to plants. Ruprecht claims iron and aluminum sulphate are injurious to clover seedlings, while Hart and Tottingham found leguminous and cruciferous plants were stimulated by calcium and sodium sulphates. Elemental sulphur proved injurious, probably through its conversion to sulphites. Tottingham claims that chlorine has a specific function for some kinds of plants. Kratzmann found some plants had a selective affinity for aluminum. It is accumulated in the sporophylls of cryptogams and in the flowers of angiosperms. Mazé claims that aluminum, boron, fluorine, and iodine are necessary to the proper development of the maize plant, and that chlorosis follows the absence of iron, sulphur, and magnesium. Gautier found fluorine has a stimulating effect on many kinds of plants.

PLANT DISEASES. Tranzchel, Klebahn, Fraser, Arthur, and others have given additional data regarding the biological relationships of rusts. Fischer has reported studies on rust specialization, and Stakman found biological races in some of the grass and cereal rusts. Reed claims there is a marked correlation between attacks of powdery mildews and the physiological condition of their host plants. Westerdijk claims plant diseases are less common in the tropics than in temperate climates and attributes it to the tropical temperatures being too high for the development of many fungi. R. E. Smith has expressed a doubt regarding the existence of physiological diseases of plants. He believes they will ultimately be found to be due to some specific organism. McAlpine considers bitter pit of apples in

Australia a result of faulty transpiration and other physiological activities. Clinton continues to advance the theory that the mosaic disease of tobacco is not due to fungi or bacteria, while Allard believes it is caused by some organism not recognized by reason of its extreme smallness. Two physiological troubles of cotton in the West Indies are considered due to unfavorable weather conditions. Eriksson claims additional proof for his mycoplasma theory of rust transmission, while Beauverie, Buchet, and others claim the presence of spores within the seed coats as a means of original infection. Montemartini says cereal rusts are over-wintered in Italy in the uredo stage. A study of the stalk disease of cereals by Voges has shown about a dozen species of fungi capable of producing the same general symptoms.

Investigations on the chestnut blight fungus, *Endothia parasitica*, are still in progress, although active measures for its control have been abandoned. The fungus has recently been reported in Vermont, North Carolina, and Nebraska, the last case being a nursery infection. The spores have been found carried by winds to a distance of 400 feet or more and the nuts and burs are also infected. The chinquapin has recently been found infected by the blight fungus. The white pine blister rust has appeared in new localities. Hedgecock and Long have described several diseases of coniferous trees. A disease of maple trees characterized by sudden wilting and dying has been reported in Virginia. Birch trees in many parts of Europe are attacked by *Plowrightia virgultorum*, according to Massee. A destructive disease of mulberry trees, the cause of which is unknown, is reported in France and Italy. The citrus canker, which is proving so destructive in Florida and elsewhere, is due to bacteria, according to the investigations of Hasse. An appropriation of \$35,000 was made by Congress for combating it, and the States where it prevails have also contributed for its eradication. A disease of walnut trees in California, due to a species of *Dothiorella*, has been described by Fawcett. Recent reports suggest the occurrence of fire blight of pear trees in Switzerland. A form of this disease in which trunks of apple trees are attacked near the ground is reported in Pennsylvania by Orton. Studies of rots of fruits and vegetables by Miss Ames show they should be held as near zero temperature as possible in storage. A large number of diseases of vegetables, fruits, and other economic plants have been described during the past year.

Experiments in the control of plant diseases are in progress in many countries, the efficiency of the applications being especially investigated. Scott has called attention to barium polysulphide as a promising new fungicide.

BIBLIOGRAPHY. Among botanical books of recent publication are the following: M. Armstrong, *Field Book of Western Wild Flowers* (New York, 1915); L. H. Bailey and A. W. Gilbert, *Plant Breeding* (New York, 1915); T. Ferraris, *I parassiti vegetali delle piante coltivate od utili* (Milan, 1915); T. Milburn, *Fungoid Diseases of Farm and Garden Crops* (London, 1915); R. K. Beattie, *Flora of the Northwest Coast* (Lancaster, Pa., 1915); N. Taylor, *Flora of the Vicinity of New York* (New York, 1915); A. Wagner, *Repetitorium der Allgemeinen Botanik* (Leipsic, 1915); and E. O. Wootton and P.

C. Standley, *Flora of New Mexico* (Washington, 1915).

BOURGET, PAUL. See FRENCH LITERATURE, Fiction.

BOVERI, THEODOR. A German zoölogist and educator, died Oct. 16, 1915. Born at Bamberg on Sept. 12, 1862, he was educated at the Realgymnasium of Nürnberg and at the University of Munich, where he received his Ph.D. degree in 1885. He was in 1887 a privat-docent at Munich, and since 1893 was professor of zoölogy at the University of Würzburg. For the year 1905-06 he was rector of the university. Boveri did important work on the excretory organs of *Amphioxus*; *Die Nierencanalchen des Amphioxus* (1892), but his most important researches were in the line of cytology where he did pioneer and epoch-making work. In his *Zellen Studien* (I-IV, 1887-1900) he gave in detail the maturation, fertilization, and cleavage of the egg of *Ascaris*, with especial reference to the behavior and fate of the chromatic material. Two later studies (1905, 1907) were devoted to the record of experiments on the egg of the sea urchin, especially as relating to normal and abnormal fertilization. In 1904 in his *Konstitution der chromatischen Substanz des Zellkerns*, he took a decided stand in favor of the theory of the individuality of the chromosomes. Many of the arguments in favor of the now widely held chromosome theory of heredity are based on these papers of Boveri's. Boveri was prominent as an educator, and in recent years many American students worked in his laboratory. He was an honorary M.D. of the University of Marburg, and a member of several learned societies.

BOWDOIN COLLEGE. An institution for higher education at Brunswick, Me., founded in 1794. The total enrollment in all departments in the autumn of 1915 was 457, and there were 89 members of the faculty. There were no notable changes in the membership of the faculty during the year, and no noteworthy benefactions were received. The productive funds at the close of the fiscal year amounted to \$2,264,034, and the income for the fiscal year was \$148,181. The library contained about 110,000 volumes.

BOWLES, SAMUEL. American editor, died March 14, 1915. He was born in 1851, and was educated at public and private schools, taking also a special course at Yale. He began work as reporter on the *Springfield Republican*, which had been established by his grandfather in 1826, soon becoming an editorial writer, and later (1855) manager. In 1858, on the death of his father, he took charge of the *Republican* as editor and publisher. During this time he held the paper in the front rank of American dailies. He received the degree of A.M. from Amherst, and L.H.D. from Olivet College.

BOWLING. The Americal Bowling Congress in 1915 passed legislation barring all teams east of Buffalo and Pittsburgh from competing in its tournament. As an offset to this action some of the Western bowlers took part in the annual tournament of the National Bowling Association held in New York City.

The winners of the various events in the American Bowling Congress tournament which took place in Peoria, Ill., follow: Individual—W. H. Pierce, Pueblo, Col., 711; two-men teams—Allen and Allen, Detroit, Mich., 1297; five-men teams—the Barry Kettlers, Chicago, Ill., 2907.

George Newman of New York City won the

individual title in the National Bowling Association tournament with a score of 675. The two-men team championship went to Walter and Smith of Rutherford, N. J., with 1232 points. The Aurania bowlers of New York City captured the five-men team honors with a total score of 2993.

BOXING. The great event of the year 1915 in the boxing world was the defeat of Jack Johnson by Jess Willard in a battle for the heavy-weight championship of the world. The bout was held near Havana, Cuba, on April 5th after a series of delays and postponements that bade fair at one time to result in the abandonment of the project. About 15,000 persons witnessed the fight which was waged in a ring on the Oriental Race Track, a few miles from the heart of Havana. The receipts were estimated at \$65,000.

Johnson entered the ring a pronounced favorite, as the record of Willard was not impressive and it was figured that the big Kansan would be utterly at sea when confronted by the speed and skill of the negro. For 16 rounds the predictions of the experts held true. Johnson landed blow after blow and at one time drove Willard to the ropes by the ferocity of his attack.

But the fact remained that Willard was still on his feet at the beginning of the 17th round and furthermore did not appear to have been bothered in the least by the shower of blows that had been rained on him. Johnson in truth was the tired man. He had realized that if he were to come out victorious he must use rushing tactics, for he was facing one who had two big advantages—youth and unusual stamina.

So the tide of battle turned and by the end of the 18th round the frenzied spectators were shouting for the knockout blow which they knew must come soon. It came after one minute and 26 seconds of fighting in the 26th round, when a left to the body was followed by a right to the jaw. The white race had regained its lost laurels.

No other boxing titles changed hands during the year, although Johnny Ertle claimed the bantamweight championship through his defeat of Kid Williams on a foul. A new boxer to spring into prominence was Les Darcy of Australia, a middleweight who knocked out Eddie McGoorty and outpointed Jimmy Clabby. Darcy arranged to visit the United States during 1916 and make a bid for the middleweight title of which Al McCoy is the claimant.

The bout of the year which attracted the most interest in New York City was that between Mike Gibbons and Packey McFarland at Brighton Beach. The men battled to a draw before a \$58,000 "gate."

The championships of the Amateur Athletic Union were decided at Boston on April 7th. The results of the final bouts were: 108-pound class—Howard Root of the Cleveland A. C. defeated Ben Bailey of the Adams A. A., Malden, Mass.; 115-pound class—Tony Vatlan, Brighton, Mass., defeated Julius Walters, Cleveland A. C.; 125-pound class—Arthur Strawhacker, Cleveland A. C., defeated John J. Emery, Cambridge, Mass.; 135-pound class—Mike Crowley, Malden, Mass., defeated C. Simonson, Union Settlement A. C., New York; 158-pound class—A. Kaufman, Trinity Club, Brooklyn, defeated Walter Wyss, Cleveland A. C.; 175-pound class—Edward C. Carr, Boston, defeated Charles W. Olsen, Boston;

heavyweight class—Arthur Sheridan, Trinity Club, New York, defeated James McDonald, Milton, Mass.

BOYCOTT. **DANBURY HATTERS' CASE.** This famous case which grew out of a strike in 1902 of the United Hatters of North America against Loewe and Company of Danbury, Conn., was advanced to its final stage by a decision of the United States Supreme Court, handed down Jan. 5, 1915. The case had been before numerous courts; in 1908 the United States Supreme Court declared the boycott illegal and authorized a suit for damages under the Sherman Act; and as long ago as October, 1909, damages under the Anti-Trust Law were assessed at \$232,240. Later appeals and judgments in 1912 and 1913 fixed the damages against the union at \$252,130, and authorized the assessment of these damages upon the individual members of the union, whether they had expressly assented to the boycott or not. It was this judgment which was affirmed by the United States Supreme Court on January 5th, thus making the total damages to be paid by the union members, including interest, nearly \$300,000. Probably no labor case of recent years has been of greater interest to lawyers, employers, labor leaders, publicists, and the general public. Since the union was not deemed sufficiently responsible financially, the suit for damages had been brought against individual members. Of the 243 original defendants only 186 survived when the final decision was rendered. Their bank accounts and real estate had been under attachment since the beginning of the suit. The union indemnified these members for their bank accounts, but refused to assume responsibility for the homes owned by 120 of them. The union did, however, at a meeting in May, 1915, vote to levy an assessment of 1 per cent per year on the earnings of all members to meet the expenses and damages of the suit. This was expected to realize between \$30,000 and \$40,000 a year. Meanwhile the officers of the Hatters' Union sought aid from the American Federation of Labor, but the Executive Council of the Federation on January 13th decided that the legal aid already given and the activities in behalf of the Clayton Act discharged all their obligations. However, at the annual meeting of the Federation in November, it was voted to request each member to set aside one hour's pay on Jan. 27, 1916, for the relief of the Danbury hatters. Finally the Danbury hatters petitioned Congress through Connecticut representatives in February to relieve them from the award of the court. This petition was based on the fact that the intent of the Sherman Law to exempt labor unions had not been made clear by the framers, and that in consequence the hatters had suffered an unjust hardship.

The decision of the court left the exact legal status of the trade unions somewhat indefinite. It was made clear that under the Sherman Law the members of trade unions could be held financially responsible for boycotts of the compound sort, when the trade boycotted is interstate, and this fixing of financial responsibility upon the union and its individual members was believed to be a serious blow to organized labor. But it was believed that section 20 of the Clayton Act of 1914, which prevents the issuance of injunctions against primary and secondary boycotts, would, until judicial interpretation of such section, permit unions to carry on peaceful persuading of

third parties to cease relations with a party to a trade dispute, such persuasion being unaccompanied by threats or coercion. Nevertheless, there were those who held that this provision of the Clayton Act would prove an insecure basis for boycotts when tested in the courts. See also **STRIKES AND LOCKOUTS.**

BOY-ED, CAPTAIN. See **UNITED STATES AND THE WAR.**

BOY SCOUTS OF AMERICA. An organization founded in 1908 for the purpose of drilling boys between the ages of 12 and 18 in self-reliance, manhood, and citizenship. It was the outgrowth of a similar movement in England, started by Gen. F. Baden-Powell. In the United States its founders were Ernest Thompson Seton and Daniel C. Beard, who combined two organizations of boys into one association. There were in 1910 over 10,000 scout masters in the United States, and over 300,000 members in the organization. During the latter part of 1915 a movement for an endowment of \$2,000,000 to carry on the expenses of the organization was begun. The honorary president is President Woodrow Wilson; honorary vice-presidents—William H. Taft and Theodore Roosevelt. The president is James E. West.

BRACKETT, CYRUS. American physicist and educator, died Jan. 29, 1915. He was born in Parsonfield, Me., in 1833, and graduated from Bowdoin College in 1859. In 1863 he was instructor in chemistry at Bowdoin College, and became professor there in 1864. Appointed professor of physics at Princeton University in 1873, he held that position until 1908, when he was made professor emeritus. Honorary degrees came to him from Lafayette and Bowdoin colleges, and from Princeton University.

BRADDON, MARY ELIZABETH. English novelist, died Feb. 4, 1915. She was born in London in 1837. Her father, who was a solicitor and a man of literary tastes, encouraged his daughter to develop a talent for writing poetry and fiction. At an early age she wrote serious and sentimental poems and sketches, and when she was 23 years old (1860) a publisher who had been attracted by her work offered her 50 dollars for a story which would combine the human interest of Dickens and the plot development of Wilkie Collins. To meet this offer she wrote *Three Times Dead*. It was not very successful, but two years later she published *Lady Audley's Secret*, which was one of the most widely read books of the day. The success of this novel established her fame and she was thenceforth greatly sought after by publishers. In quick succession followed *Aurora Floyd* (1862), *The Doctor's Wife* (1864), and from that time on for many years she was one of the most popular writers of England. Her later books, however, never reached the success of *Lady Audley's Secret*. Her novels dealt chiefly with English life. Her last book was *Miranda* (1913). She married John Maxwell, and her son, William Babbington Maxwell, was a well known writer of novels and stories.

BRAUN, LILY. See **GERMAN LITERATURE, Fiction.**

BRAZIL, UNITED STATES OF. A federal republic of South America. The capital is Rio de Janeiro.

AREA AND POPULATION. Neither the area nor the population is definitely known. Among the varying estimates of area, the one which for the present seems best to represent the extension of

the republic is 8,497,540 square kilometers (3,280,900 square miles). The 1890 census returned a population of 14,333,915, and the 1900 census, 17,318,556. Since the latter date it is generally believed that the population has rapidly increased, so that the number of inhabitants in 1913 was estimated at 24,308,000. This figure, however, is regarded by some authorities as excessive. The following table shows by states the estimated area and population (1913), and names the state capitals:

	<i>Sq. km.</i>	<i>Pop.</i>	<i>Capitals</i>
Amazonas . . .	1,894,724	500,000	Manáos
Pará	1,149,512	780,000	Belém
Maranhão . . .	459,884	600,000	São Luis
Plauhy	801,797	450,000	Therézina
Ceará	104,250	1,000,000	Fortaleza
Rio Grande do Norte	57,485	480,000	Natal
Parahyba	74,781	650,000	Parahyba
Pernambuco . . .	128,895	1,650,000	Recife
Alagoas	58,491	800,000	Maceió
Sergipe	89,090	500,000	Aracajú
Bahia	426,427	2,560,000	São Salvador
Espirito Santo . .	44,889	480,000	Victoria
Rio de Janeiro . .	68,982	1,250,000	Nichtheroy
São Paulo	290,876	8,200,000	São Paulo
Paraná	251,904	570,000	Curitiba
Santa Catharina .	48,585	510,000	Florianopolis
Rio Grande do Sul	286,553	1,750,000	Porto Alegre
Minas Geraes . . .	547,855	4,850,000	Bello Horizonte
Goyaz	747,811	803,000	Goyaz
Matto Grosso . . .	1,378,788	800,000	Cuyabá
Fed. District . . .	1,118	1,000,000	Rio de Janeiro
Acre Territory . . .	191,000	195,000	Rio Branco
Brazil	8,497,540	24,308,000	Rio de Janeiro

The population of cities is so variously estimated that until a census is taken little dependence can be placed upon published estimates. Rio de Janeiro (including the whole federal district) is supposed to have about 1,000,000 inhabitants; São Paulo, 400,000 to 450,000; São Salvador (Bahia), about 300,000.

The reported number of immigrants to Brazil from 1820 to the end of 1914 is 3,415,741. Immigrants in 1913 numbered 192,684; in 1914, 82,572. In 1913 and 1914 respectively, 78,208 and 33,918 arrived at Rio de Janeiro, and 110,976 and 47,570 at Santos. Immigration is chiefly to the southern states, where the climate is more healthful. In the period 1907-13, immigrants numbered 845,289; of these, there were 324,431 Portuguese, 164,332 Spaniards, 145,016 Italians, 46,195 Russians, 38,213 Syrians, etc., 30,431 Germans, 21,100 Austro-Hungarians, 11,868 Japanese, 7899 French, and 6033 British.

EDUCATION. As in most of Latin America, the greater part of the population is composed of illiterates. Considerable effort, however, has been made in recent years to further elementary education, which is free, secular, and in some states, nominally compulsory. Schools of all kinds number upwards of 13,000, with an estimated enrollment of nearly 750,000. Some provision is made for secondary education; in 1909 the reported number of secondary schools was 327, with 30,258 students. There are a number of normal, special, and technical schools. Brazil has no university, but in several of the large cities are faculties of law, medicine, and engineering.

PRODUCTION. Agriculture is the principal source of wealth, but vast areas of the country are unsettled and even unexplored. The crop of first commercial importance is coffee, grown chiefly in the state of São Paulo, but also in Rio

de Janeiro, Espirito Santo, and Minas Geraes. Coffee production in 1909-10, 11,501,023 metric quintals; in 1910-11, 7,610,131; in 1911-12, 7,473,600; in 1912-13, 6,300,000. The crop for 1914-15 was estimated at 10,500,000 quintals. Next to coffee in commercial importance is rubber, which grows wild in the Amazon region, and the cultivation of which is encouraged by the government. Implements and material for use in the culture, gathering, and refining of rubber are admitted to the country free of duty; demonstration farms are conducted to promote the culture, and bounties are granted to cultivators. Other important crops are sugar cane, produced chiefly in Pernambuco and other parts of the northeast; cotton, also largely grown in the northeast; maté (herve maté), chiefly in Paraná; cacao, especially in Bahia; tobacco, in Bahia and Rio Grande do Sul; besides these are large crops of corn, rice, bananas, and manioc, the last forming the staple food of the people. According to a 1913 enumeration, there were in Brazil, 7,289,690 horses, 30,705,400 cattle, 10,649,000 sheep, 10,000,000 goats, 3,207,940 mules and asses, and 18,500,000 swine. Parts of Brazil are rich in minerals, but mining is not greatly developed; gold, manganese, monazite sand, and gems are produced. Manufacturing has become of much importance in the federal district and shows a considerable development in the states São Paulo, Rio de Janeiro, Paraná, Rio Grande do Sul, Sergipe, Pernambuco, Ceará, and Bahia. The leading manufacture is cotton-piece goods.

COMMERCE. Imports and exports of merchandise, special trade, have been as follows, in thousands of milreis (paper):

	1902	1907	1910	1912	1913
Imports—					
471,114	644,938	713,868	951,870	1,007,495	
Exports—					
785,940	860,891	989,418	1,119,737	972,731	

With the paper milreis considered to be worth 32.4 cents, the imports and exports of merchandise in 1912 were equivalent in value to \$308,243,736 and \$362,794,846 respectively; in 1913, \$326,428,509 and \$315,164,687. The leading imports include machinery and other iron and steel manufactures, railway materials, cotton fabrics, coal, flour, codfish, wine, arms and ammunition, kerosene, paper, and jerked beef. In 1913 and 1914, respectively, the coffee export was 13,267,449 and 11,271,000 sacks (of 60 kilos each); rubber, 36,232 and 33,468 metric tons; tobacco, 29,388 and 26,980; maté, 65,415 and 59,354; sugar, 5367 and 31,860; cacao, 29,759 and 40,767; cotton, 37,424 and 30,434; hides, 35,075 and 31,442.

The following table compares the trade by countries with that of 1910, in thousands of dollars:

	<i>Imports</i>		<i>Exports</i>	
	1910	1913	1910	1913
United Kingdom	65,842	79,881	72,105	41,702
Germany	36,775	57,044	35,626	44,392
United States	29,704	51,290	110,144	102,568
France	21,863	31,940	25,642	38,686
Argentina	19,767	24,294	11,409	14,848
Belgium	10,461	16,679	5,510	8,093
Portugal	12,866	14,328	819	1,589
Italy	7,867	12,866	2,054	4,067
Uruguay	5,991	7,047	5,569	5,167
Total, including other	231,292	326,429	304,870	315,165

In 1913, there were entered at the ports, 27,782 vessels, of 29,170,179 tons, of which sailing vessels numbered 6295, of 606,286 tons. Brazilian vessels, 20,905, of 10,343,968 tons, of which sail 5743, of 251,195 tons. British tonnage entered, 9,866,817; German, 4,285,095; French, 1,306,102; Italian, 1,124,068. North American tonnage entered was only 24,240.

COMMUNICATIONS. As reported for Dec. 31, 1914, the length of railway in operation was 26,062 kilometers (16,194 miles). The reported length in operation Dec. 31, 1913, was 24,580 kilometers (15,273 miles); of this, lines belonging to and managed by the federal government comprised 3522 kilometers (2188 miles); lines belonging to the federal government and leased to companies, 9218 kilometers (5727 miles); lines conceded by the federal government, some with and some without interest guarantee, 5558 kilometers (3454 miles); lines operated by private companies under concessions of state governments, 6282 kilometers (3903 miles).

Telegraphs in 1912: offices, 2244, with 58,257 kilometers of line and 117,682 kilometers of wire. Radiotelegraph stations, 27; on board ships, 62. Post offices (1914), 3587.

FINANCE. The monetary unit is the gold milreis, equivalent to about 54.6 cents. The ordinary medium of exchange is the paper milreis. Its par value is 32.444 cents, but its actual value fluctuates, being in 1915 about 25 or 26 cents. The budget for 1913 showed estimated revenue of 106,382,884 milreis gold and 353,257,000 milreis paper, and estimated expenditure, 63,284,719 gold and 469,463,810 paper; for 1914, revenue, 130,219,000 gold and 367,511,000 paper; expenditure, 95,469,000 gold and 435,773,000 paper; estimated expenditure for 1915, 70,999,236 gold and 378,862,047 paper. Public debt, Dec. 31, 1913: foreign debt, £91,609,100 and 299,032,000 francs; floating foreign debt, £2,000,000; internal debt, 701,382,600 milreis; floating internal debt, 278,501,725 milreis. Paper money in circulation, 601,488,303 milreis.

ARMY. At the end of the year 1914, the new Brazil infantry regulations were published, and embodied the result of modern study, being practically identical to the Argentine regulations, and both being translated bodily from the German.

NAVY. The navy in 1915 included the following vessels: Two battleships (*Minas Geraes*, 1908; *São Paulo*, 1909), aggregating 38,500 tons; 2 armored coast guards (1898 and 1899), 6320 tons; 2 monitors (1905), 940 tons; 1 protected cruiser (1896), 3450 tons; 2 scout cruisers (*Bahia* and *Rio Grande*, 1909), 6200 tons; 3 torpedo cruisers (1896-98), 3090 tons; 10 torpedo-boat destroyers (1908-10), 6500 tons; river gunboats, transports, etc. The dreadnought *Rio de Janeiro* (27,500 tons) was completed at Elswick in 1914. Brazil sold the vessel to Turkey, and it was renamed *Sultan Osman I*. It did not join the Turkish fleet before the outbreak of the war, when it was taken over by the British government and received the name *Agincourt*.

GOVERNMENT. The chief executive is the President, who is elected for four years by direct vote and is not eligible for the succeeding term. He is assisted by a Cabinet of seven members appointed by and responsible to himself. The Congress consists of two houses, the

Senate and the Chamber of Deputies. Senators, 63 in number, are elected by direct vote for nine years. The deputies, numbering 212, are elected for three years. For the term ended Nov. 15, 1914, the President was Marshal Hermes da Fonseca. The Vice-President, Wenceslão Braz Pereira Gomes, was elected President for the ensuing term; Vice-President, Urbano dos Santos.

The states have elective governors and legislatures and enjoy a large degree of autonomy.

HISTORY. Economic Conditions. The opening of the year found the country just emerging from the financial and business crisis into which it had been plunged during the preceding year. The European war had deprived Brazil of its best customers, made it impossible to secure imports or money abroad (see *INTERNATIONAL YEAR BOOK*, 1914), and had even reduced the amount of credit with foreign banks on which Brazilian bankers had been accustomed to depend. The financial administration of the country was paralyzed, and, as a result of their inability to dispose of their products in the disorganized state of the market, many of the people suffered severely. Under the able administration, however, of President Wenceslão Braz, the country soon began to emerge from this crisis, which had seemed so threatening at the close of the previous year. In the north, particularly in the city of Pernambuco, the commercial centre of the district, trade began to revive, and by March was in a fairly prosperous condition. In the south, especially in the state of Rio Grande do Sul, business had been less affected by the abnormal conditions, and in March was nearly normal. American merchants were more encouraged and began to offer their goods with better results. Early in May the President recommended to Congress the amendment of the electoral law, the revision of the customs tariff, the acceptance of the remainder of the Civil Code, the voting of a budget, and the adoption of financial methods adequate to improve the condition of the country. In the following month the Chamber of Deputies approved an issue of 30,000 *contos* (\$191,100,000) with which to pay treasury debts contracted prior to 1915. The government likewise authorized the Bank of Brazil to act as a discount agency in the sale of coffee and other national products. Protective tariff measures were passed to aid in the establishment of a market for these products.

Relations With Other South American Countries. In an effort to bring about better diplomatic as well as industrial and economic relations with the other leading powers of South America, Dr. Lauro Muller, Premier of Brazil, left Rio de Janeiro in the last of April to visit several of the other nations of Latin America. In the last of May a treaty of peace was signed at Buenos Aires by Dr. Muller and the representatives of Argentina and Chile. A Brazilian newspaper in writing of this conference, said:

"The journeys of Lauro Muller both in the United States and in the Southern Continent were the consecration and crowning of our traditional political policy. All our diplomatic future will be developed along the line traced for more than four score years. All our international policy revolves still around those two great principles which the empire established—

harmony with the United States and peace with South America.

"The ABC alliance before its actual consecration was able to show itself a diplomatic force. It shunned conflicts between the powers of North and South America, and now this instrument of peace affirms that while working for the harmony of others it assures at the same time the unchangeableness of its own spirit of coöperation."

This treaty meant an actual alliance between these strong South American republics, an idea which had long been hoped for but which had never been consummated. It was stated unofficially that the United States might be asked to enter this alliance. In August, Brazil joined with the United States, Argentina, Chile, Guatemala, Uruguay, and Bolivia in an effort to bring about law and order in Mexico, and in October Brazil recognized Carranza as the provisional president of Mexico (see MEXICO).

Relations with the United States. The trouble in Europe made it possible for the United States to enter into closer economic relations with Brazil and American goods were in greater demand than ever before. In May it was reported unofficially that the Brazilian government was endeavoring to float a loan of \$15,000,000 in this country. The failure of London to become enthusiastic over the Argentine bonds and the rapidity with which these bonds were bought up in New York convinced the government that the United States was the best place to look for financial assistance. Brazil took a prominent part in the Pan-American financial conference held in Washington in May. This conference was called at the instance of President Wilson in an attempt to better financial conditions existing in North and South America. The Brazilian delegates to the conference recommended among other things:

"The establishment of a reliable means whereby merchants and manufacturers of each nation can determine with reasonable accuracy the financial responsibility of the purchaser of the other nations; it strongly recommends that there be established between the United States and Latin-American countries a system of direct exchange based on the dollar unit of the United States of America in order to facilitate the interchange of products adapted to the needs of American countries."

BREEDING. See STOCK RAISING AND MEAT PRODUCTION.

BRETHREN, CHURCH OF THE. A religious denomination known also as the Dunkers or Dunkards. There are three branches, the Conservative, the Progressives, and Old Order. Of these the Conservative is the largest. It included in 1915 about 97,000 communicants, 990 churches, and 3009 ministers. The next in importance is the Progressives, which has 2720 communicants, 212 churches, and 200 ministers. The Old Order has about 3500 communicants, 72 churches, and 218 ministers. There is also a small branch called the Seventh Day German Brethren. This has only about 275 communicants. The Conservative group maintains ten schools, one of which is the Bethany Bible School in Chicago, devoted entirely to study in the Bible. There is a large publishing house at Elgin, Ill., where a large number of papers and books are issued. Mission work is carried on in Denmark, Sweden, India, and China. The an-

nual convention was held at Hershey, Pa., in June, 1915. The Progressive branch maintains a publishing house at Ashland, Ohio.

BREWING. See LIQUORS.

BRIAND, ARISTIDE. See FRANCE, *History*.

BRICK. See CLAY-WORKING INDUSTRIES.

BRIDGES. During the year 1915 there was considerable construction of large bridges under way in America, but few new projects were undertaken. In Europe, on the Continent, demolitions and the construction or replacement of bridges purely for military purposes were far more to the front than civil engineering. In India the Hardinge Bridge over the Lower Ganges in Bengal, a long steel truss structure which had been under construction for nearly seven years, was opened on March 4, 1915. It is over a mile long, with 15 trusses, each of 345 feet span. The most important work of the year was the closing of the Hell Gate arch of the New York Connecting Railway, from Long Island to the mainland, while the Quebec Bridge construction maintained satisfactory progress and was substantially advanced. Progress was also to be noted on the large bridges crossing the Ohio River at Metropolis, Ill., Sciotoville, Ohio, and Pittsburgh, Pa., and over the Mississippi River at St. Paul, Minn., Keokuk, Iowa, and Memphis, Tenn. In the American bridge construction under way the use of high strength steels was notable, and five of the most important bridges building during the year were of special material in at least some of the parts. These structures, however, were only a small proportion of the tonnage actually fabricated at the great bridge shops, so that the use of high strength steels was to be considered special rather than general.

Within the last few years there has been a tendency in American bridge construction, particularly where reinforced concrete and masonry are employed, to demand more ornamental treatment and to secure the coöperation of architects. This was particularly true in the case of city railway bridges as well as for parks and boulevards. This tendency has been shown at Philadelphia and in the decoration of the Smithfield Bridge in Pittsburgh. A notable example was the Q Street Bridge across Rock Creek, Washington, D. C., which is a five arch span structure of reinforced concrete. The tone of this bridge is red, the main part of the spandrels being reddish concrete, bush-hammered for rough surfaces, and the quoins, coping, railing, and abutment faces of red sandstone, whose color is matched in the concrete by mixing with the cement a special red sand. There is also ornamental carving on the railing, and a carved head at the base of each cantilever, while four huge bronze buffaloes face each other on the pedestals at the approaches.

Important progress was made during the year on movable bridges, the vertical lift and bascule types were favored forms of construction, and some notable projects were carried out. A new type of swing bridge was designed by J. B. Strauss, to whom earlier was due the counterbalanced lever lift bridge familiarly known as the bascule bridge, which is now so widely used. The Strauss Cantilever Swing Bridge, as the design is familiarly known, has for its chief characteristics, first, the use of direct driven trucks running upon ordinary railroad rails to effect rotation; and second, the construction of

the central portion of the draw span as a cantilever projecting beyond the centre pier with the arms pin-connected at their ends so as to form simple spans from the ends of the cantilever to the abutments. In each arm the top chord is connected with the top chord of the central draw portion by a two-panel link, which is in turn connected to a pivoted vertical, while the pivot point of that vertical connects with an operating strut and a driving motor on the central draw portion, so that when the strut is drawn backward the four linked elements on each side of the centre act as a double toggle, raising the end of each arm off its bearings on the abutment until the span is free to turn. A series of trucks under the central draw at four points, the intersections of the four verticals of the central span with the chords, comprise the turning mechanism, the number of wheels on each truck varying and running on four concentric rails. When the bridge is in its closed position a wedge is automatically operated and the live load of the bridge is taken off the trucks and transmitted directly to the piers. With the lifting of the arms the wedges are automatically withdrawn and the bridge then moves with the trucks. The operating mechanism includes a driving mechanism on the trucks, consisting of electric motors which are geared to the driving wheels. The advantage claimed for the long Strauss bridge is that the trucks replace the drum, roller, and tread of one type of swing or the corresponding centre trailer wheels of the other, producing a saving both in steel and cost of fabrication, and eliminate the costly circular rack used in all types of swing bridges, while it makes possible the use of cantilever and simple span construction in the process in place of continuous girders, thus reducing the weight per foot as well as the total loads. By eliminating the spider and end lifts there is a lesser weight to move, and as the bridge is more simple in construction, its operation and maintenance cost less.

The most important bridge proposed during the year was a new Thames River Bridge to be built by the New York, New Haven and Hartford R. R., at New London, Conn., to take the place of the five span structure built in 1888-89. Although this is a two-track structure, the increased train weights made necessary in 1908 the limitation of its use to single track operation, and as the bridge is on the main line between New York, Providence, and Boston, the efficiency of transportation on the system was seriously interfered with. The new bridge is to be designed so as to carry four tracks with the heaviest known loading, the superstructure being arranged on this basis, but at first the superstructure will be built for two tracks only. There are to be three spans of 330 feet, one of 185 feet, and one of 212 feet. It also will be a five-span structure with an electrically operated bascule lift span. The bridge is to be 185 feet upstream from the old bridge, which is to be presented to the State of Connecticut for a highway bridge. Foundations for the four piers of the new bridge will range from 75 to 142 feet in depth, and the piers themselves will be made of concrete with masonry facing between high and low water. Three piers are to be constructed by open well dredging, but a pneumatic caisson will be used for the fourth. The extreme dimensions of the piers are 42 x 98 feet. About 48,000 cubic yards of concrete will be required. The

superstructure is to contain 5000 tons of steel, and while contracts had not been let towards the end of 1915, it was assumed that the work would be under way in 1917. Two bridge approaches of 1300 and 1600 feet will be required. The estimated cost was \$2,500,000.

The year 1915 was notable for the fact that two long steel arch bridges in process of erection were closed, one of which was the 977½-foot Hell Gate Bridge, where the closure of the arch was made on October 1st, four months after work on the main arch had begun. This is the longest steel arch span in the world, while the third longest was the bridge in Cleveland, Ohio, with a 591-foot arch span and double deck floor, which was closed on October 8th. In the construction of these arches it is interesting to note that the adjustment of the Hell Gate arch involved the use of hydraulic jacks and about 1¼ hours' work, while the closure of the Cleveland bridge was made by the use of screw toggles in about 1 hour and 50 minutes. Up to Oct. 1, 1915, when the Hell Gate arch was closed, 13,000 tons of steel had been placed, and at the end of the year practically all of the steel in the floor was in position, so that a record of some 19,000 tons in seven months was made. Progress was also made with the bridge spans, and one day—March 8th—a world's record of 1504 tons of steel placed was made. It was expected that the entire New York Connecting Railroad, of which the Hell Gate Bridge is the principal part, with its viaducts and other structures, would be completed within eighteen months after the time of closure of the main arches.

The working season on the Quebec Bridge, which contains the record length span of 1800 feet, closed on Nov. 9, 1915, and about 32,000 tons of steel were placed during the season in somewhat over six months. False work was erected on the south shore, the south 515-foot cantilever arm and main posts, part of the north anchor arm, and the 580-foot north cantilever arm, forming the main significant work of the year, involving the erection of 44,000 tons out of a total of 63,000 tons of steel going into the bridge. In a single day 670 tons of steel were placed by one traveler, as compared with the record of 410 tons under similar conditions in 1914. The entire erection of the Quebec Bridge demonstrated the accuracy of the shop work and efficient organization in the assembly yard and in the field. Flying false work and electrically operated travelers all contributed to the successful prosecution of the work.

At Sciotoville, Ohio, the piers were completed for the Chesapeake and Ohio Northern Railway Bridge, which is the longest long-span riveted continuous truss bridge in the United States, having two 750-foot spans. Progress was being made on the material and the erection of the superstructure was announced for the following year. The longest pin connected simple truss span of the kind in the world, namely 720 feet in length, was a feature of the bridge which was being built jointly by the Chicago, Burlington and Quincy Railroad, and the Paducah and Illinois Railroad, at Metropolis, Ill. The piers were practically completed, but the superstructure was not to be erected until the spring of 1916. Important new records were also made in railroad plate girder construction in the track elevation work on the "Nickel Plate" at Chicago, where girders were used for the 130-foot, 6¼-

inch simple span. Plate girders 239 feet in length and 13½ feet deep were used by the Canadian Pacific near Montreal for the double track draw span across the Lachine Canal at Caughnawaga.

In the construction of the Harahan Cantilever Bridge over the Mississippi River at Memphis, high water caused a delay of two months, and it was not until the end of the year that the superstructure was put in position. The fixed span was swung, as well as the anchor arm, and one cantilever arm and one-half of the suspended span of the Memphis end were erected. Accidents occurred on December 23rd, 25th, and 29th due to high water in the Mississippi River. The false work between Piers 3 and 4 was carried out, taking with it some of the lower chord members and floor stringers. As the adjacent 621-foot fixed span had been swung two days previously and was completed, it remained intact, as well as the false work on which it rested at some points. The entire bridge had been erected except the two 186-foot cantilever arms, the 418-foot semi-suspended span, and one-half of the 418-foot suspended span.

A million dollar structure connecting Portland (Me.) with South Portland, across an arm of the harbor, was being erected during the year. It was distinguished by a great variety of design, embracing reinforced concrete girder and cantilever spans and steel cantilever girders with rolling-lift draw span. The new bridge at St. Louis, to which reference has been made in earlier issues of the YEAR BOOK (1911 and 1912), was having its \$2,000,000 approach completed, an undertaking on a par with the original construction.

A notable modern viaduct of granite masonry with architectural effects is the Fontpedrouse structure over the Tet River in France. This is a two level structure where the masonry arches are carried on high piers, one of which is supported on the crown of a pointed arch below. The lower narrow ravine is spanned by a 98½-foot pointed arch on whose keystone a high intermediate pier of the main arch viaduct is supported. The upper viaduct, which is only 6 per cent grade, consists of four 56-foot main circular arches, with twelve approach spans, also circular arches, about 29½ feet clear between the piers, two on one side and ten on the other. This viaduct carries an electric railway and has walkways on either side.

The world's largest reinforced concrete bridge was the Tunkhannock viaduct, on the Delaware, Lackawanna and Western, 240 feet in height, which was completed and put into service Nov. 7, 1915.

A notable bridge failure of the year was the Division Street Bridge in Spokane, which on December 18th collapsed, dropping a street car into the river, killing 5 passengers and injuring 12. A commission of engineers appointed by the State engineer reported that "the failure was due to the simultaneous breaking of the bottom chord bars of the first panel of the north end of the east truss because of granulation. There was no excessive load on the bridge at the time it collapsed." The commission also stated that the steel work showed every evidence of good character and that there was no reason to suspect defects of any kind in its composition. The bridge was built in 1892, and was a through subdivided Pratt Truss bridge, 180 feet long, of

ten 18-foot panels, with a 40-foot roadway, and two sidewalks. The designer believed that the failure was probably caused by an earlier injury to the structure when it had been repaired without proper heat treatment of various bars that were replaced.

BRITISH COLUMBIA. A province of the Dominion of Canada, between Alberta and the Pacific Ocean. Capital, Victoria. Area, 355,855 square miles. The population, according to the census of 1911, was 392,480, the increase over 1901 being 119.7 per cent. Victoria had in 1911 31,660 inhabitants; Vancouver, 100,401; New Westminster, 13,199. The provincial government is under a lieutenant-governor, appointed by the governor-general of the Dominion. He acts through an executive council, or responsible ministry, of seven members. There is a unicameral legislative assembly of 42 members elected by direct vote for four years. Lieutenant-Governor in 1915, Frank S. Barnard, who was appointed to succeed Thomas W. Paterson, Dec. 5, 1914. Premier in 1914, Sir Richard McBride. See CANADA.

BRITISH EAST AFRICA. See EAST AFRICA PROTECTORATE; UGANDA; ZANZIBAR.

BRITISH GUIANA. A British colony on the northeast coast of South America. The area is stated at 90,277 square miles. The interior is almost unbroken forest. Returns of the 1911 census were as follows: 6901 aborigines, 126,517 East Indians, 114,780 negroes, 2622 Chinese, 706 Africans, 10,084 Portuguese, and 3937 other Europeans; total, 296,041 (153,717 males, 142,324 females). The unenumerated aborigines in the unfrequented parts of the country are estimated at about 10,000. Population (1911) of Georgetown, the capital, 54,318. The production of cotton and coffee, once important, has declined. Sugar production is now the chief industry. There are 43 sugar plantations, with a combined area of 162,139 acres (72,527 under sugar cane, 6448 under plantains, etc., and the remainder pasture or uncultivated). The export in 1913 was 87,414 tons of sugar, 3,260,986 gallons of rum, and 6860 tons of molasses. Rice is grown in the lowlands on about 42,000 acres (export in 1913, 17,269,504 pounds, valued at £106,155). Balata, timber, and charcoal are also exported.

Gold and diamond diggers number about 10,000; gold export (1913), 79,194 ounces, valued at £287,361; diamond export, 9078 carats, valued at £17,149. About half the trade is with the United Kingdom and a third with the United States. Railways are as follows: Georgetown to Rosignol, 60½ miles; Vreeden Hoop to Greenwich Park, 15; branch to gold diggings, 18½. There are telegraph, telephone, and cable systems. State-aided schools (1913-14), 277, with 36,820 pupils; grant-in-aid, £31,357. In the following table the commerce statistics are for calendar years 1910 to 1913, inclusive; financial figures are for fiscal years.

	1909-10	1910-11	1911-12	1912-13
	£	£	£	£
Imports	1,774,457	1,749,766	1,703,355	1,694,155
Exports	1,985,337	1,820,198	1,798,597	2,198,120
Revenue	540,269	563,100	580,446	608,633
Expend.	546,711	542,757	590,745	592,532
Shipping * ..	897,864	1,006,199	921,385	

* Tonnage entered and cleared.

Customs revenue (1912-13), £336,907. Public debt, March 31, 1914, £883,415. Governor in 1915, Sir Walter Egerton, appointed July 5, 1912.

BRITISH HONDURAS. A British colony on the east coast of Central America. Area, 8598 square miles; population (1911 census), 40,510; estimate of April 2, 1914, 41,543. Belize, the capital, had (1911) 10,478 inhabitants; Stann Creek, 2640; Corosal, 1789; Orange Walk, 856. Valuable forests are alternated with stretches of rich arable land on which oil-bearing nuts, vanilla, etc., grow wild in great profusion. Wood-cutting is the main occupation of the people; the exports in 1913 included 15,027,000 superficial feet of mahogany, 1,330,237 of cedar, and 2812 tons of logwood. The fruit export (1913) included 617,537 bunches of bananas, 3,300,450 plantains, and 6,352,630 coconuts; other products are sapodilla gum (3,163,129 pounds in 1913), rubber (12,496 pounds), and sponges and tortoise-shell. In the following table commercial figures are for calendar years 1910 to 1913, inclusive; financial figures are for fiscal years.

	1910-11	1911-12	1912-13	1913-14
	£	£	£	£
Imports . . .	2,819,217	2,886,677	3,496,908	3,185,368
Exports . . .	2,344,380	2,685,849	2,856,043	3,126,225
Revenue . . .	459,295	1,201,908	575,243	590,982
Expenditure .	542,810	532,123	611,131	609,441
Shipping * .	979,427	588,867	630,064	816,858

* Tonnage entered and cleared.

There are telegraph and telephone lines, and 25 miles of railway. Sir Wilfred Collet was appointed Governor in 1913.

BRITISH INDIA. See INDIA.

BRITISH NEW GUINEA. See PAPUA.

BRITISH NORTH BORNEO. The northern part of the island of Borneo, forming together with adjacent islands a British protectorate, under the jurisdiction of the British North Borneo Company. Area, 31,000 square miles. The 1911 census returned about 208,000 inhabitants, mainly Bruneis, Illanuns, Bajaus, and Sulus on the coast, engaging in fishing and trade; Dusuns, who are agriculturists; Muruts, etc., in the interior—peaceable in the main, but occasionally engaging in head-hunting expeditions. The Europeans number about 400, and the Chinese 30,000. The exports go almost entirely to Singapore and China, and consist of timber in considerable quantities, tobacco, rubber, coconuts, sago, coffee, pepper, cattle, cutch, etc. The chartered company does not engage in trade. Coal is worked and iron ore and petroleum have been discovered. British, Mexican, and other dollars having ceased to be legal tender, the Straits Settlements dollar (worth \$0.56776) is now the standard coin. Completed railway, 130 miles. Imports (1913), 5,438,897 S. S. dollars; exports, 7,398,128; shipping entered and cleared, 547,044 tons; revenue proper, including land sales, 1,810,259 dollars; expenditure, 990,388. The company administers the country through a resident Governor. Sandakan (administration headquarters), Jesselton, Lahad Datu, Tawas, and Kudat are the principal towns.

BRITISH SOMALILAND. See SOMALILAND PROTECTORATE.

BRITISH SOUTH AFRICA. See SOUTH AFRICA, UNION OF.

BRITISH WEST AFRICA. A collective

name for the following British colonies and protectorates in western Africa: NIGERIA, including colony and protectorate; GOLD COAST, including Ashanti and the Northern Territories; SIERRA LEONE, including colony and protectorate; and GAMBIA, including colony and protectorate. See these separate titles.

BROOKE, RUPERT. English poet and writer, died April 23, 1915. He was born at Rugby in 1877, and was educated at Rugby School and at Kings College, Cambridge. He lived for some years in Cambridge, or in the neighboring village of Grandchester, and there wrote a volume of poems which was published in 1911. He enlisted at the outbreak of the war in Europe, and died as a result of blood poisoning while on board a French hospital ship. A number of poems inspired by the war show remarkable power. A posthumous volume, *Poems of Rupert Brooke*, was published in 1915.

BROWN, THOMAS JEFFERSON. American jurist, died May 26, 1915. He was born in Jasper County, Ga., in 1836, and was educated in the common schools and at Baylor University. He was admitted to the Texas bar in 1857, and practiced law in different cities in that State. In 1888 and again in 1890 he was elected to the Texas Legislature. In 1892 he was appointed judge of the District Court of Texas, and in the year following was made associate justice of the Supreme Court of the State. He became chief justice in 1911, and held that position at the time of his death.

BROWN UNIVERSITY. An institution for higher education, founded in 1764 at Providence, R. I. The total enrollment in all departments in the autumn of 1915 was 765 undergraduates, 209 in the separate Women's College, and 140 graduate students. The faculty numbered 94, including instructors and assistants. Prof. F. H. Allinson was appointed head of the department of Greek literature and history, in the place of Professor Manatt, deceased. Kenall K. Smith was appointed assistant professor of Greek literature and history. The university received no special gifts during the year. The productive funds at the end of the fiscal year ending June 30, 1915, amounted to \$4,566,134. The library contained 230,000 volumes.

BRYAN, GEORGE JAMES. American publisher and writer, died Jan. 23, 1915. He was born at Fosterdale, N. Y., in 1852; for a time taught school and did newspaper work; then entered the book business in New York City. He organized the University Society, and for it directed the compilation of anthologies, dictionaries, and reference works. He also made sets of subscription books which were sold to other publishers, under whose imprints they appeared. Notable among these was the large set, *Irish Literature* (10 vols.).

BRYAN, WILLIAM J. See UNITED STATES, Cabinet.

BRUCE REPORT ON ALLEGED GERMAN OUTRAGES. See BELGIUM, *History, Bryce Report*.

BRYN MAWR COLLEGE. An institution for higher education of women, founded at Bryn Mawr, Pa., in 1885. The total enrollment in all departments in the autumn of 1915 was 453 students. The faculty numbered 61. The college received during the year from the estate of the late Elizabeth Swift Shippen of Philadelphia, \$10,000; from Alexander Simpson of Philadel-

phia, for the foundation of a scholarship, \$5000; and from present students, alumnae, and friends of the college, for a new athletic field, \$4000. The productive funds in 1915 amounted to \$2,002,300, and the annual income \$395,624. The library contained about 75,000 volumes.

BUCKNAM, RANSFORD B. American engineer, known for many years under the title, "Bucknam Pasha," admiral of the Turkish fleet, died May 27, 1915. He was born in Maine in 1860. At the age of four years he was left an orphan, and received a scanty schooling in his native town. When still a boy, he became a sailor on the Great Lakes, and afterwards was in the employ of a line of Australian packets. After many years of service at sea, he became marine superintendent for the Cramps of Philadelphia. In 1904, when Sultan Abdul Hamid bought an armored cruiser from the Cramps, Bucknam was selected to take the vessel to San Francisco. At the time the Sultan was desirous of forming a first-class navy, and at once engaged Bucknam to superintend its upbuilding. He soon became a conspicuous figure among Turkish officials. His ability and scrupulous honesty made him unique, and he was one of the few persons trusted by Abdul Hamid. He was successively made a bey and a pasha, and was given the title of Admiral of the Fleet. After the deposition of Abdul Hamid, Bucknam was not able to agree with the Young Turks, and he retired to civil life. With the outbreak of the Italian War, he assisted the Turkish government by successful expeditions in blocking the line to the Tripolitan coast.

BUCKWHEAT. Statistics or estimates on the world's buckwheat production are not available. In 1915 Canada produced 8,101,000 bushels on 343,800 acres, the average yield per acre being 23.56 bushels. The United States, in 1915, as reported by the United States Department of Agriculture, produced 15,769,000 bushels on an area of 806,000 acres, the average yield per acre being 19.6 bushels. While the area, as compared with the acreage the preceding year, was greater by 14,000 acres, the production was 1,112,000 bushels less. The production in 1915 was also smaller than the average yield for the five years 1909-13, the difference being 828,000 bushels. Yields were reported in 1915 from 24 States, the range being from Maine to North Carolina and Tennessee in the South, and to Nebraska and Kansas in the West. As shown by figures on the production during the 10-year period 1905-14, the highest average yields per acre are secured in northern New England, Maine leading with 29.7 bushels, being followed by New Hampshire with 25.6, and Vermont with 23.7 bushels per acre.

BUILDING. See ARCHITECTURE; and FINANCIAL REVIEW.

BUILDING OPERATIONS. At the end of the year 1915 the new Building Code for the city of New York was all but completed. This code was being prepared by Rudolph P. Miller, formerly superintendent of the Building Department of Manhattan, in consultation with various engineering, architectural, and real estate interests. It was designed to provide a reasonable and substantial basis for future building construction and inspection in the city of New York, in which proper construction, fire protection, sanitation, and the general interest of citizens of all classes could best be served. The

code was taken up in detail and passed, after hearings of those interested, section by section, through the year, by the Board of Aldermen, and contained a number of important sections as well as changes. It was provided that a certificate of occupancy should be issued by the Superintendent of Buildings previous to the occupation of any new building, or one that had been altered, so that it would be impossible to use a structure for other purposes than those for which it had been designed and constructed. A new scheme of classification was adopted, a change in the fireproof limits was made, new specifications for lighting and ventilation not only for tenements but for other buildings were adopted, provision was made for increased exit facilities, for fire protection for high buildings, for projections beyond the building line, for reinforced concrete construction, for greater use of hollow tile, for terra cotta construction, for providing flues and chimneys for a lower building where the owner of adjoining property builds above the height of an existing structure of his neighbor, the inspection and certification of elevator installation, and for the assessment of penalties, and to provide for immediate compliance with the orders of the Building Department.

In Philadelphia new regulations in regard to the construction of reinforced concrete buildings were formulated, and provided that plans and specifications filed should be accompanied by stress computations and descriptions in detail, including the dimensions and nature of all reinforcements, the quality, proportions, and method of the concrete, and the dead and live loads which each floor was designed to carry. No deviation in the construction was to be permitted except upon the written consent of the Chief of the Bureau of Building Inspection, and the construction of a reinforced concrete building was to be under the constant supervision of an inspector furnished by the owner or architect and acceptable to the Chief of the Bureau, who was empowered to stop improper inspection at any point. It was further provided that the plans on file should be marked to indicate the progress of the work and give the times and dates when the concrete was deposited.

During the year there was published the *Fourth Edition of the Building Code*, recommended by the National Board of Fire Underwriters, prepared by Ira W. Woolson, the consulting engineer of the board, and incorporating the most advanced requirements in fire protective building construction. This code goes into building problems in considerable detail, and contains many features that have been incorporated in local codes, giving requirements for materials and permissible methods of construction. This code provides for a certificate of occupancy for the building and classification of buildings, both for construction and occupancy, and increased limitations for the use of combustible materials. Where sprinklers are used the code allows an increase of allowable floor area between fire walls, but limits the area according to the number of frontages on streets. There is also a limit to heights, provision for speedy egress, methods of elevator construction, outside stairways, fire or smokeproof doors, and other details of construction, the entire code representing the latest and most reasonable requirements in this field. The code also takes up materials and

working stresses, giving the latest developments for iron and steel, timber, and other materials, based on official and other tests. This code, which consists of 328 pages, illustrated, is published by the National Board of Fire Underwriters, New York, from whom it may be procured.

An important step was taken by the Secretary of the Treasury in reference to the construction of post office and Federal buildings, by the issuing of an order to establish uniformity and business economy in such work. Accordingly, four different classes of buildings were formulated, depending upon the amount of business transacted, and a policy of standardization was determined on, as well as the use of plans for buildings hitherto constructed. The four classes were as follows:

Class A.—For post offices of the first class with annual receipts of \$800,000 or over: Marble or granite facing; fireproof throughout; metal frames, sash, and doors; interior finish to include the finer grades of marble, ornamental bronze work, mahogany, etc. Public spaces to have monumental treatment, mural decorations; special interior lighting fixtures.

Class B.—Post offices of the first class with receipts from \$60,000 to \$800,000: Limestone or sandstone facing; fireproof throughout; exterior frames and sash metal; interior frames, sash, and doors wood; interior finish to exclude the more expensive woods and marbles; ornamental metal to be used only where iron is suitable; restricted ornament in public places.

Class C.—For post offices of the second class with receipts of \$15,000 or over, and of the first class up to \$60,000: Brick facing with stone or terra cotta trimmings; fireproof floors; non-fireproof roof; frames, sash, and doors wood; interior finish to exclude the more expensive wood and marble; the latter used only where sanitary conditions demand; public spaces restricted to very simple forms of ornament.

Class D.—For post offices having annual receipts of less than \$15,000: Brick facing, little stone, or terra cotta used; only first floor fireproof; stock sash, frames, doors, etc., where advisable; ordinary class of building such as any business man would consider a reasonable investment in a small town.

During the year a testing machine for testing the strength of fire resistance of building columns was installed in the Underwriters' Laboratory at Chicago by a joint body formed of the Associated Factory Mutual Fire Insurance Companies, National Board of Fire Insurance Companies, and the United States Bureau of Standards. This machine was designed and built to test to destruction full sized building columns under end load and at temperatures equaling those of a general conflagration. Provision was made for a series of tests, and a preliminary circular was published in which criticism of the methods to be followed was asked, and suggestions for extension of the work requested. See also AGRICULTURAL EDUCATION; ARCHITECTURE; and FIRE PROTECTION.

Returns of building operations from 71 of the largest cities in the United States, compiled by the *Engineering News* (New York), indicated that in 1915 there was an increase of construction of about 6 per cent over the previous year. In the early part of the year conditions remained about the same as in 1914 and there

was general inactivity, but an improvement toward the end of the year denoted increased prosperity. The accompanying statistics indicate the trend of operations during the year. In the Eastern States there was a considerable increase, namely, from \$287,558,291 in 1914, to \$333,534,253 in 1915; in the Southern States a decline from \$48,518,674 in 1914, to \$42,897,814 in 1915; in the Central States an increase from \$257,628,670 in 1914, to \$290,902,907 in 1915; and in the Western States a decline from \$81,957,225 in 1914, to \$48,987,814.

BUILDING OPERATIONS IN THE U. S. 1914 AND 1915

BUKOWINA. See AUSTRIA-HUNGARY.

BULGARIA. One of the "Balkan States"; a constitutional monarchy of Europe; formerly a principality under the suzerainty of Turkey. Capital, Sofia.

AREA AND POPULATION. Area and population (Dec. 31, 1910) are shown below:

	Area		Pop.
	Sq. km.	Sq. m.	1910
Bulgaria, Northern.....	63,751.1	24,614	3,095,735
Eastern Rumelia	32,594.4	12,585	1,241,778
Total Bulgaria	96,345.5	37,199	4,337,513

The area acquired from Turkey in 1913 is stated at 26,100 square kilometers (10,077 square miles), with an estimated population of 709,600; area ceded to Rumania, 8340 square kilometers (3220 square miles), with 305,000 inhabitants. Thus the total area is about 114,000 square kilometers (44,000 square miles), with a population of about 4,742,000.

The ancient Bulgars were of Finnic stock; the modern Bulgarians are made up of Slavic, Teutonic, and Mongoloid elements, amalgamated with Mussulman and Greek. Their language belongs to the southern Slavic group and the Cyrillic alphabet is used.

The population in 1900 numbered 3,744,283, of whom 2,887,684 were Bulgarians, and 530,275 Turks. Of the total population in 1910, 3,497,794 were Bulgarians, 466,117 Turks, 121,435 Tziganes, 79,787 Rumanians, 43,273 Greeks, 40,118 Jews, 21,145 Pomacs, 18,050 Tartars, 12,914 Armenians, etc. Sofia had, in 1910, 102,812 inhabitants; Varna, 47,981 inhabitants; Ruschuk, 36,255; Slivno, 25,142; Shumla, 22,225; Plevna, 23,049; Philippopolis, the capital of Eastern Rumelia, 47,981. There were, in 1911, 41,868 marriages, 176,909 living births, and 74,860 deaths. Movement of population, 1909: 38,917 marriages, 172,583 living births, 1544 still-births, 113,304 deaths; surplus of births over deaths, 59,279.

RELIGION AND EDUCATION. The national religion is the Orthodox, the Bulgarian Church being a separate communion of the Eastern Church. In 1909-10 there were reported to be 3786 elementary schools with 8697 teachers and 430,011 pupils (262,394 boys and 167,717 girls); in 1910-11, 4674 elementary schools, with 8686 teachers and 453,592 pupils.

PRODUCTION. The following table shows main crops, area in hectares devoted to each; yields in quintals, and average yield per hectare in 1912-13:

	Hectares		Quintals		Qs.
	1911-12	1912-13	1911-12	1912-13	ha.
Wheat...	1,120,500	1,030,000	17,350,000	16,500,000	16.0
Rye...	215,000	185,000	3,150,000	2,750,000	14.9
Barley...	260,000	230,000	4,000,000	3,500,000	15.2
Oats...	180,000	170,000	1,750,000	2,000,000	11.8
Corn...	650,000	650,000	14,000,000	11,500,000	17.7
Rice...	8,000	8,000	80,000	35,000	17.7

Of the total area under cultivation (3,872,777 hectares in 1909), 2,394,252 hectares were planted to cereals, 523,371 to forage plants, 85,240 to vines, 60,259 to potatoes and other roots, 25,231 to melons, etc., 13,215 to industrial plants, 11,088 to legumes, 8277 to orchards and gardens, and 7621 to rosefields.

COMMERCE AND COMMUNICATIONS. In the table below will be found imports and exports in thousands of leva:

	1908	1909	1910	1911	1912
Imports	130,150	160,430	177,357	199,345	213,110
Exports	112,357	111,434	129,052	184,634	156,407

In thousands of leva the details of the 1910 trade are as follows: Imports—textiles, etc., 49,383; metals, etc., 23,299; machinery, etc., 19,777; colonial products, 10,348; skins, etc., 9188; timber, etc., 6993; chemical products, 5538; resins and oils, 5109; paper, etc., 3772. Exports—cereals, 80,811; animal products, 13,002; textiles, etc., 10,037; animals, 7324; perfumes, 5555; skins, 4238; colonial products, 2056; metals, etc., 1127; wooden-ware, 656; etc. In the order of their import importance the countries of origin and destination were Austria-Hungary, Germany, Great Britain, Turkey, France, Belgium, Italy, etc. Leading exports in 1912, in thousands of leva: cereals, 108,549; animal substances, 16,731; perfumes, 11,639; animals, 3989.

Total railway lines constructed and in operation in 1913, 2233 kilometers (1387 miles). Four lines of railway were under construction in Bulgaria previous to the outbreak of the Balkan War. The value of all lines is given (1909) as 225,530,645 leva; of rolling stock, 24,942,487. Net receipts (1909), 19,187,200; net expenditures, 13,873,687. For negotiations concerning the Dedeagatch Railway, see paragraph so entitled under *History*.

FINANCE. A table showing revenue and expenditure for three years in leva (1 leva = 19.3 cents) is given below (1912 budget):

	1910	1911	1912
Revenue	173,389,493	198,795,814	190,278,440
Expenditure	168,451,041	182,487,552	188,929,057

In 1911 the revenue from customs amounted to 63,230,000 leva; direct taxes, 39,949,000; transport, 30,420,000; domains, etc., 12,680,000; imports, 10,710,000; licenses, 9,450,000; fines, 1,031,000. Expenditure for public works, 30,382,000; instruction, 23,598,000; interior, 10,460,000; commerce and agriculture, 10,083,000; finance, 8,443,000; foreign affairs, 6,452,000; justice, 5,836,000. The budget for 1914 placed the revenue at 256,995,070 leva, and the expenditure at 254,787,677 leva, exclusive of 2,200,000 leva

extraordinary. The public debt at the end of 1914 amounted to 914,785,983 leva, including a floating debt of 302,401,607 leva.

ARMY. With the declaration of war by Bulgaria against Serbia, Oct. 9, 1915, and the previous state of war with Russia which began two days earlier, a new and well equipped army was put into the field. The rifles of the Bulgarian army were made after the Mannlicher and Mauser systems, the patterns of the latter having been captured from the Turks, so that both Austrian and Turkish cartridges could be used, and thousands of rounds for each type of rifle were on hand at the outbreak of hostilities. The victories of the Bulgarians over the Turks greatly augmented their artillery so that it was stated at the beginning of the war they had 750 light field guns, 300 75-millimeter Schneider cannon, and 150 rapid firers of the same calibre captured from the Turks, in addition to 250 Krupp guns, 87-millimeter; 150 Krupp guns, 75-millimeter; 40 Schneider rapid fire howitzers, 120-millimeter; 40 Krupp howitzers, of the same calibre; 25 150-millimeter Krupp guns; 30 rapid fire 75-millimeter mountain guns; 50 rapid fire Krupp guns of the same calibre.

NAVY. The navy includes 6 first-class torpedo boats (*Smely, Hrabry, Derzky, Choumny, Letiachty, and Stroggy*), of 100 tons each; 1 cruiser (*Nadejda*), of 735; 2 yachts, 5 transports, 2 second-class torpedo boats of 20 tons each, and some other small craft.

GOVERNMENT. The executive authority is vested in a King (since Oct. 5, 1908). Ferdinand I, King of the Bulgarians, was born at Vienna, Feb. 28, 1861, son of Prince Augustus of Saxe-Coburg and Gotha. Prince Boris (born Jan. 30, 1894) is the eldest son by the King's first marriage, in 1893, to Princess Marie Louise of Parma. His second wife (Feb. 28, 1908) is Eleonore of Reuss Köstritz.

By the constitution of 1879 (amended 1893 and 1911), the legislative authority was vested in a single chamber, the *Sobranje*, whose members are elected by universal manhood suffrage (one member to every 20,000 of the population). The King acts through a council of ministers nominated by himself.

On Oct. 9th, the minister of war, General Jekoff, resigned his position in the cabinet and assumed active command of the field army; he was succeeded as war minister by Major-General Naidenoff. At the same time the portfolio of the interior, which had hitherto been held by the premier, was given in charge of M. Christo Popoff.

HISTORY

NEUTRALITY AND NEGOTIATIONS. Although the Bulgarian government had publicly declared its determination to maintain a neutral position in the great war, and had reiterated its declarations of neutrality even after the entry of Turkey into the war, nevertheless the diplomats of the Triple Entente made every effort at the beginning of 1915 to bring Bulgaria into the war on the side of the Entente; and throughout the greater part of the year the most optimistic interpretation of Bulgaria's rather ambiguous attitude was cherished by the English press. The endeavor of English, French, and Russian diplomacy was to offer Bulgaria sufficient territorial compensations to ensure her friendship, to reconstruct the Balkan alliance

which had been so disastrously disrupted by jealousy in 1913, and to secure the intervention of Bulgaria in the war together with Rumania and Greece. The Serbian government, however, displayed the utmost reluctance, even when urged by the Entente, to yield to Bulgaria the full extent of her demands in Macedonia; as for Greece, while the premier, M. Venizelos, was willing to make concessions to Bulgaria, the King was obviously unfriendly to the project.

THE GERMAN LOAN. The probability of Bulgaria's joining the Allies was distinctly lessened when, at the beginning of February, Bulgaria effected a loan arrangement with a syndicate of German bankers, the *Disconto Gesellschaft*, whereby an advance of \$30,000,000 was to be made upon the \$100,000,000 loan negotiated by Bulgaria in the summer of 1914. About \$7,000,000 was to be applied to the service of the Bulgarian national debt, and of various other foreign obligations; about \$8,000,000 was to be placed at the disposal of the Bulgarian National Bank; and the balance of \$15,000,000 was to be paid in installments and applied to the budget. The strengthening of this financial bond between Bulgaria and Germany may account for the apparent distrust and diffidence with which Serbia, Greece, and Rumania regarded the negotiations for a reconstructed Balkan alliance affiliated to the Triple Entente. Still the Bulgarian premier emphatically declared that the loan had not involved any political obligations on the part of Bulgaria towards the Central Powers. "Bulgaria," said M. Radoslavoff, in a remarkable speech before the *Sobranje*, March 28th, "is not bound by engagements to any one, and, according to the view of the government, Bulgaria should not assume premature obligations, because in so doing, solely from sentimental reasons, the country might incur great danger. No one is looking to Bulgaria purely for Bulgaria's own sake. Each seeks Bulgarian co-operation in his own interests. Every Bulgarian government, therefore, must be on its guard against temptations, however attractive, whether they come from the West or from the East. . . . When the moment comes that our own interests are endangered, the people and the Government of Bulgaria will make the necessary decisions." In the light of subsequent events the premier's statement might be interpreted as evidence that even at that time the Bulgarian government had its ultimate alliance with the Teutonic Powers in view, and was prolonging negotiations with the Entente without the slightest intention of accepting the Entente's offers, "however attractive" they might be. At the time, however, the speech was regarded as an encouraging sign of Bulgaria's impartial readiness to bargain.

THE VALANDOVA INCIDENT. A Serbo-Bulgar frontier incident on April 2nd threatened so to inflame hostility between Serbia and Bulgaria as completely to destroy all possibility of an alliance. From the evidence published by the Serbian government it appeared that a force of Bulgarian *komitadjis*, some of them wearing the uniform of the Bulgarian army, and provided with small-arms and bombs of official Bulgarian and Turkish pattern, had crossed the frontier near Strumitza and attacked the Serbian frontier blockhouse at Valandova. Thirty Bulgars and 60 Serbs had been killed in the raid. The Bulgarian government disclaimed all responsibility for the affair, and furthermore alleged

that the trouble had been caused not by a Bulgarian invading party, but by insurgent Serbian citizens, probably Mohammedans, who had been driven to revolt by the notoriously harsh attitude of the Serbian government towards those of its newly acquired subjects in Macedonia, who were unwilling or unable to pose as loyal Serbs. The "Valandova Incident" was smoothed over, thanks to Russian diplomatic intervention.

THE DEDEAGATCH RAILWAY. Meanwhile Bulgaria was conducting negotiations with Turkey for the acquisition of the Dedegatch Railway. Bulgaria, it will be recalled (see YEAR BOOK, 1913), had been given one seaport, Dedegatch, on the Aegean, by the treaty of Bucharest; but the only railway connecting Dedegatch with the interior of Bulgaria passed through Turkish territory by way of Adrianople and the Maritsa valley. Bulgaria desired to obtain from Turkey the strip of territory lying west of the Maritsa and Tunja rivers, and including the railway station in a southeastern suburb of Adrianople (Karagatch) but not Adrianople itself; Turkey was decidedly reluctant to accede to this demand. Negotiations dragged on throughout the summer. On July 17th M. Panaretoff announced that a tentative arrangement had been agreed upon, whereby express trains might be run from Bulgaria to Dedegatch without stopping in Turkish territory. A more extensive agreement was unofficially reported, July 23rd. But as late as the third week in August rumors were current that Bulgaria was on the point of breaking off the negotiations in disgust and making war on Turkey.

NEGOTIATIONS WITH THE ENTENTE. The Entente during this time had been making earnest efforts to outbid the Turks. A joint note had been handed to the Bulgarian government by the representatives of the Entente at Sofia, May 29th. A little over a fortnight later Bulgaria replied, asking for more definite assurances of what she might expect in return for her support. The Entente, as it appeared, was unable to make such assurances convincing, for at the beginning of August, M. Radoslavoff gave out an interview avowing that he was conducting parallel negotiations with both sides, with the sole object of making the best possible bargain. In another interview, on August 9th, the Bulgarian premier made the significant statement that "Bulgaria is fully prepared and waiting to enter the war the moment she receives absolute guarantees that by so doing she will obtain that for which other nations already engaged are striving, namely, the realization of her national ideals. . . . The bulk of these aspirations lie in Serbian Macedonia, which with its 1,500,000 of Bulgarian inhabitants, was pledged and assigned to us at the close of the first Balkan War. It is still ours by right and principle of nationality. When the Triple Entente can assure us that this territory will be returned to Bulgaria and our minor claims in Greek Macedonia and elsewhere realized, the Allies will find us ready to fight with them. But these guarantees must be real and absolute. No mere paper ones can be accepted." At the time when this remarkable statement was made, Bulgaria had just concluded arrangements with the *Disconto Gesellschaft* syndicate of German bankers for an advance of \$50,000,000, of which about half was to be paid in cash and the remainder applied to outstanding obligations, and had given the Ger-

man syndicate a two years' option on an additional \$50,000,000 of Bulgarian 5 per cent government securities. Whether out of the suspicion which Bulgaria's German loan inevitably generated, or out of pure willingness to grant Bulgaria's request for more definite offers, the Entente Powers on August 10th delivered a joint communication at Sofia. The contents of the joint note were stated upon not altogether unimpeachable authority by the *Giornale d'Italia* to include the immediate cession to Bulgaria of that part of Serbian Macedonia which had been assigned to Bulgaria by the Serbo-Bulgarian treaty of 1912. Bulgaria was to renounce all claims to Saloniki, Vodina, and Uskub. Serbia was to be compensated with Seres and Kavala, which would be taken from Greece. In explanation of the failure of the Entente's diplomacy in Bulgaria, it may be pointed out that the Bulgarian government had good reason to believe that the offer of Macedonia, if made by the Entente, was not cordially concurred in by the parties most vitally concerned, Serbia and Greece; the prestige of French and British arms had been destroyed in the Dardanelles operations, and the prowess of Russia had just proved incapable of defending Warsaw; Turkey, moreover, was at last ready to cede the Dedegatch Railway.

AGREEMENT WITH TURKEY. Possibly the Bulgarian negotiations with the Entente were used by M. Radoslavoff to hasten Turkey's decision. At any rate, on August 23rd the conclusion of a Turco-Bulgarian treaty was announced, and the details of the agreement made public September 7th-8th. Bulgaria was to receive the corner of European Turkey marked off by the line of the Maritsa and Tunja rivers, including the railway station at Karagatch, but not including Adrianople. The treaty was finally ratified September 22nd, but a brief delay was to intervene before the territory was occupied by Bulgaria. Since considerable anxiety had been manifested with regard to the implications of this agreement with Turkey (the Entente Powers had presented a new note at Sofia, September 16th), M. Radoslavoff announced that Bulgaria had promised Turkey to maintain armed neutrality.

BULGARIA'S DECISION. The mobilization of the Bulgarian army, necessary for the maintenance of "armed neutrality," was announced September 21st by the Bulgarian minister in Washington. In spite of unfounded rumors of a cabinet split, which served to divert attention, the decision of Bulgaria to side with Turkey and the Central Powers could no longer be concealed. Sir Edward Grey, manifestly unconvinced by the official announcement of the Bulgarian government (September 26th) that mobilization was not preparatory to war, declared before the British House of Commons, September 28th, "If Bulgarian mobilization should result in Bulgaria assuming an aggressive attitude on the side of our enemies we are prepared to give our friends in the Balkans all the support in our power." Reports from London and Athens pointed to the existence of a secret treaty signed in July, 1915, between Bulgaria and the Central Powers, whereby Bulgaria was promised Saloniki, Kavala, Kastoria, Albania, and Macedonia, in return for intervention against Serbia. The growing anxiety of the Entente with regard to Bulgaria's intentions became still more manifest the first week in October, when Russia dispatched an ultimatum to Sofia. "The presence," affirmed

the ultimatum, "of German and Austrian officers at the Ministry of War and on the staff of the army, the concentration of troops in the zone bordering Serbia, and the extensive financial support accepted from our enemies by the Sofia cabinet, no longer leave any doubt as to the object of the military preparations of Bulgaria." The Bulgarian government was allowed 24 hours to dismiss the Teuton officers and "break with the enemies of the Slav cause and of Russia." The Bulgarian cabinet, however, was too confident to be swerved from its purpose by such means. M. Radoslavoff was quoted by the *Lokal Anzeiger* as saying, "Events coming in the near future promise more favorable results. Bulgaria will extend her frontiers toward the northwest and the south. Our relations with Rumania are cordial. The conflict between Rumania and the Central Powers already has been settled. Rumania will remain neutral during the whole of the offensive of the Central Powers against Serbia, even if new complications arise in the Balkans." With unfaltering confidence, therefore, not only in the strength of Bulgaria's army and in the prowess of her allies, but also in the security of her northern frontier, Premier Radoslavoff and King Ferdinand embarked on the great "national enterprise," and attacked Serbia on October 13th. War was declared against Serbia the next day. On October 14th Great Britain declared war on Bulgaria, and Sir Edward Grey admitted that the Central Powers had successfully outbid the Entente in their offers for Bulgarian support. Russia and Italy declared war against Bulgaria on October 19th. The details of Bulgaria's invasion of Serbia are given in the article on the WAR OF THE NATIONS (q.v.).

BULLEN, FRANK THOMAS. English author and lecturer, died March 1, 1915. He was born in Paddington in 1857. His education was limited to the public schools. He went to sea in 1869 and served in all parts of the world in various capacities, rising to be chief mate. In 1883 he became clerk in the Meteorological Office, continuing there until 1899. He began about that time to write sea stories, the first of them, *The Cruise of the Cachalot*, being a considerable success. This and his other writings show intimate knowledge of sea life, and remarkable descriptive power. His other books include *Idylls of the Sea*, *The Log of a Sea Waif*, *Our Heritage the Sea*, *The Call of the Deep*, *A Compleat Sea Cook*. He also contributed stories, articles, and essays to periodicals.

BUREAU OF CORPORATIONS. See TRUSTS.

BUREAU OF MINES. See UNITED STATES, section so entitled.

BUREAU OF SOCIAL HYGIENE. See PROSTITUTION.

BURG, FERDINAND. Formerly Archduke Ferdinand of Austria, died March 12, 1915. He was born in 1864, a nephew of the Emperor Francis Joseph, and brother of Archduke Francis Ferdinand, who was assassinated in Bosnia. On his marriage in 1911 to a daughter of Hofrat Czueber, a Swiss professor of engineering, all his privileges as a member of the Imperial family were renounced, and he assumed the name of Burg. Several years before the Emperor had declined to permit him to renounce his title and marry.

BURKE, ANDREW SHERIDAN. An American

soldier, died Jan. 12, 1915. He was born in Cincinnati in 1839. In 1861 he enlisted as a private in the Federal army, and served throughout the war, rising to the rank of captain. In 1866 he was appointed first lieutenant in the regular army. He became major in 1883; lieutenant-colonel in 1888; and colonel in 1892. In 1898 he was appointed brigadier-general of volunteers, and in 1902 brigadier-general in the regular army. In the same year he was retired at his own request. He received brevets for gallantry during the Civil War.

BURKE, THOMAS MARTIN ALOYSIUS. American bishop of the Roman Catholic Church, died Jan. 20, 1915. He was born in Ireland in 1840, but when still a child removed with his parents to Utica, N. Y. He studied at St. Michael's College in Toronto and at St. Charles's College in Maryland; he graduated from the latter institution in 1861, and in the same year entered St. Mary's Seminary, Baltimore, where he began the study of theology. At the end of three years he received the degrees of M.A. and D.D. and was ordained in 1864. He served as assistant in St. John's Church, Albany, and later became rector of St. Joseph's Church of the same city. He was appointed vicar-general of the diocese of Albany in 1877, and upon the death of Bishop McNierney was appointed administrator of the diocese. He was consecrated bishop of Albany in 1849. Bishop Burke was greatly interested in educational matters, and directed St. Joseph's School for Boys at Albany. Aside from his religious duties, he participated in civic affairs, and frequently acted as arbitrator in settling strike disputes in Albany and elsewhere. He was a Knight of the Holy Sepulchre, and Commander of the Holy Cross of Jerusalem.

BURNAM - EDDIN, MEHMED. Turkish prince, died March 11, 1915. He was born in 1886, the fourth son of Abdul Hamid, former Sultan. During the reign of his father he was the 14th in the line of successors to the throne according to the prescribed system of succession, but it was said that Abdul Hamid intended to make him his successor. In 1909, when the latter was dethroned, the prince was kept under guard in the palace for a time on the charge of being concerned in a conspiracy for the restoration of absolutism. He was assassinated, supposedly by political enemies.

BURR, JOSEPH ARTHUR. American jurist, died April 18, 1915. He was born in Brooklyn, N. Y., in 1850, and graduated from Yale College in 1871. He then studied law in Columbia Law School, graduating in 1873. In the following year he was admitted to the bar. In 1896 until the consolidation of Brooklyn with New York, he was the corporation counsel for the former city. In 1904 he was appointed justice of the Supreme Court of New York, and was a judge of the appellate division from 1909 until his death.

BUSSEY, CYRUS. American soldier, died March 6, 1915. He was born in Hubbard, Ohio, in 1833, received a common school education, and in his early years engaged in mercantile pursuits. In 1860 he was a member of the Iowa Senate as a Democrat, and was a delegate to the board of conventions which nominated Stephen A. Douglas for president. At the outbreak of the Civil War, he raised the third Iowa cavalry, and became its colonel. He was later promoted to be brigadier-general and brevet major-general.

At the battle of Pea Ridge he commanded a brigade; later was in command of the second cavalry division of the Army of the Tennessee; at the siege of Vicksburg was chief of cavalry of Grant's army; and he led the advance of Sherman's army against General Johnston at Jackson, Miss. He defeated General Johnston at Canton, on July 18, 1863. In the last year of the war he commanded the third division of the seventh army corps. After the war he became a commission merchant in St. Louis and New Orleans. He was for six years president of the New Orleans Chamber of Commerce, and in 1881 he removed to New York, which remained his home until his death. He was active in politics, and took part in campaigns from 1860 on. From 1889-93 he was Assistant Secretary of the Interior.

BUTTER. See DAIRYING.

CALIFORNIA. The population of the State, as estimated by the United States Bureau of the Census, on July 1, 1915, was 2,848,275.

AGRICULTURE. The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1914-15, were as follows:

	Acreage	Prod. Bu.	Value
Corn 1915	64,000	2,624,000	2,809,000
..... 1914	60,000	2,160,000	1,879,000
Wheat 1915	440,000	7,040,000	6,688,000
..... 1914	400,000	6,800,000	7,072,000
Oats 1915	211,000	6,968,000	8,482,000
..... 1914	220,000	7,700,000	4,081,000
Rye 1915	8,000	112,000	101,000
..... 1914	8,000	136,000	116,000
Barley 1915	1,360,000	39,440,000	24,453,000
..... 1914	1,402,000	42,060,000	24,815,000
Rice 1915	34,000	2,268,000	2,041,000
..... 1914	15,000	800,000	800,000
Potatoes ... 1915	78,000	10,140,000	7,605,000
..... 1914	75,000	10,350,000	7,245,000
Hay 1915	2,511,000	4,520,000	50,624,000
..... 1914	2,700,000	5,265,000	43,173,000
Cotton 1915	84,000	634,000	1,822,000
..... 1914	47,000	50,000	1,670,000

a Tons. b Bales of 500 pounds each.

MINERAL PRODUCTION. The gold production of the State in 1914 was \$20,653,296, compared with \$20,406,958 in 1913. The increased output was about equivalent to the great placer yield. The mined production of silver in 1914 was 1,471,851 fine ounces, compared with 1,378,399 ounces in 1913; 473,143 ounces came from copper ores. In 1914 California produced 29,784,173 pounds of copper, compared with 32,492,265 pounds in 1913. In the total output, the State ranked seventh in 1914. California is first among the States in the production of petroleum. There were produced in 1914, 99,775,227 barrels, compared with 97,788,525 barrels in 1913. In the value of the production the State ranks second, being surpassed by Oklahoma. The output of 1914 was valued at \$48,066,096, compared with a value of \$45,709,400 in 1913. A total of 512 wells were completed in 1914, of which 465 produced oil.

TRANSPORTATION. The total railway mileage in the State on Jan. 30, 1915, was 11,778. This includes 8177 miles of main track, and represents an increase of 316 miles over the mileage of 1914. Railways having the longest mileage are the Southern Pacific, 6229; Atchison, Topeka, and Santa Fe, 2249; Northwestern Pacific, 451; San Pedro, Los Angeles, and Salt Lake, 511; Western Pacific, 498.

EDUCATION. The school population of the State in 1914 was 513,319. This includes 7808 students at the universities. In the same year the total enrollment in all schools up to high schools was 501,021, with an average daily attendance of 373,478. The teachers numbered 13,250 men, and 2369 women. Men teachers received an average yearly salary of \$1018, and women \$745. In the high schools the average yearly salary was \$1570 for men, and \$1125 for women.

FINANCE. The report of the State Treasurer for the biennial period 1912-14 shows cash receipts during the period of \$60,947,876. The disbursements amounted to \$66,530,156, leaving cash in the treasury on June 30, 1914, of \$19,213,233. This included a balance of \$9,903,533 at the beginning of the period.

CHARITIES AND CORRECTIONS. The State institutions for charities and corrections include State prisons at San Quentin and Folsom, the Preston School of Industry, the Whittier State School, California School for Girls, State Hospitals at Stockton, Napa, Agnew, and Mendocino, the Southern California State Hospital, the New State Hospital, Sonoma State Home, the Folsom State Hospital, and the Industrial Home for Adult Blind. The total expenditures for these institutions in 1914 was \$2,561,833.

POLITICS AND GOVERNMENT. The Legislature was in session in 1915. A measure was passed abolishing political party distinction. By the terms of this the names of the candidates for political parties would no longer appear on party ballots, except in the election for Congressmen and for presidential electors. The measure was defeated by referendum on October 28th. The Legislature enacted a provision for the employment of convicts for the building of roads.

On January 23rd, Governor Johnson declared himself opposed to any amendment to the anti-alien land act, passed by the Legislature of 1913. A bill had been introduced to the Assembly eliminating the three-year leasing clause, and the Governor declared that he would veto this bill if it were passed. The measure failed in passage. The alien land law was held constitutional on August 4th, in a decision handed down by Judge Works of Los Angeles. In this decision the court held that an alien could hold a mortgage on land. The case was that of a mortgage given to a Japanese for a term of years. The attorneys for the mortgagee claimed that a Japanese could not hold a mortgage which might give him title to the property. Judge Works held that a mortgage was merely incidental to the commercial transaction, which an alien is permitted to make under the law and the American-Japanese treaty of 1911. The California law provides that any one unfitted to become a citizen in the United States shall not acquire land in California.

STATE OFFICERS. Governor, Hiram W. Johnson; Lieutenant-Governor, John M. Fahleman; Secretary of State, Frank C. Jordan; Controller, John S. Chambers; Treasurer, F. W. Richardson; Attorney-General, U. S. Webb; Surveyor-General, W. S. Kingsbury; Superintendent of Public Instruction, Edward Hyatt; Adjutant-General, C. W. Thomas, Jr.

JUDICIARY. Supreme Court: Chief Justice, Frank M. Angellotti; Associate Justices—F. W. Henshaw, William G. Lorigan, Henry A. Melvin, Lucien Shaw, William P. Lawler.

STATE LEGISLATURE:

	<i>Senate</i>	<i>House</i>	<i>Joint Ballot</i>
Republicans	20	33	53
Democrats	10	17	27
Progressives	9	28	37
Socialists	..	2	2
Republican majority ..	1	..	..

CALIFORNIA, UNIVERSITY OF. A State university for higher education at Berkeley, Cal., founded in 1868. The total attendance in all departments in the autumn of 1915 was 8736. There were 434 members of the faculty. Departments of the university include the college; colleges of law, medicine, and pharmacy; the university farm; and the San Francisco University of Art. The endowment amounts to about \$5,000,000, and the annual income to about \$2,000,000. The library contains about 300,000 volumes, and several thousand manuscripts. The president is Benjamin Ide Wheeler.

CALLENDER, GUY STEVENS. American educator and economist, died Aug. 9, 1915. He was born at Harts Grove, Ohio, in 1865, and graduated from Oberlin College in 1891. He took a post graduate course at Harvard, receiving the degree of Ph.D. in 1897. In 1895-6 he was instructor in political economy at Wellesley College, filling the same position at Harvard from 1897-1900, while from 1900-03 he was professor of political economy and sociology at Bowdoin College. From the latter year until his death he was professor of political economy in the Sheffield Scientific School. He was the author of *Selections from the Economic History of the United States, 1765-1860* (1909).

CAMBODIA. A kingdom of Farther India, constituting a French protectorate and forming part of French Indo-China. The capital is Pnom-Penh; its population, which is variously stated, is probably over 60,000. Much of the country is covered with forest. The natives cultivate rice, cotton, betel, tobacco, cardamoms, etc., and raise cattle and buffaloes. Most of the foreign trade passes through Saigon (Cochin-China). The name of the native king is Sisowath. See FRENCH INDO-CHINA.

CANADA, DOMINION OF. A British self-governing dependency north of the United States. Capital, Ottawa, in Ontario.

AREA AND POPULATION. Canada's nine provinces, with the Yukon Territory and Northwest Territories, have a combined area computed at 3,729,665 square miles. By provinces and territories, the land and water areas are stated as follows, in square miles:

	<i>Land</i>	<i>Water *</i>	<i>Total *</i>
Alberta	252,925	2,860	255,285
British Columbia	858,416	2,489	855,855
Manitoba	281,926	19,906	251,832
New Brunswick	27,911	74	27,985
Nova Scotia	21,068	360	21,428
Ontario	365,880	41,382	407,262
Prince Edward Island ..	2,184	..	2,184
Quebec	690,865	15,969	706,834
Saskatchewan	248,882	8,318	251,700
Yukon Territory	206,427	649	207,076
Northwest Terr.	1,207,926	34,298	1,242,224
The Dominion	3,608,910	125,755	3,729,665

* The water area is exclusive of Hudson Bay, Ungava Bay, the Gulf of St. Lawrence, and all other tidal waters excepting that portion of the St. Lawrence River which is between Pointe-des-Monts in Saguenay and the foot of Lake St. Peter.

In the foregoing table, the areas of Ontario, Quebec, Manitoba, and the Northwest Territories have been adjusted to conform to the Boundary Extension Acts of 1912, whereby these three provinces were enlarged by annexations from the Northwest Territories. The following table shows the area by provinces before the Boundary Extension Acts became operative, the population in 1891, the population according to the censuses of April 1, 1901, and June 1, 1911, and increase per cent of population between 1901 and 1911:

	<i>Sq. mi.</i>	<i>Pop. '91</i>	<i>Pop. '01</i>	<i>Pop. '11</i>	<i>Inc.</i>
Alta.	255,285	..	73,022	374,663	413.08
B. C.	355,855	98,173	178,657	892,480	119.68
Man.	73,732	152,506	255,211	455,614	78.52
N. B.	27,985	321,263	331,120	351,889	6.27
N. S.	21,428	450,396	459,574	492,338	7.13
Ont.	260,862	2,114,321	2,182,947	2,523,274	15.56
P. E. I.	2,184	109,078	103,259	93,728	*9.23
P. Q.	351,873	1,488,535	1,648,898	2,008,232	21.49
Sask.	251,700	..	91,279	492,482	439.48
Y. T.	207,076	..	27,219	8,512	*68.73
N. T.	1,921,685	98,967	20,129	18,481	*8.18
Can.	3,729,665	4,833,289	5,371,315	7,206,643	34.17

* Decrease per cent.

The increase of the area of Manitoba, Ontario, and Quebec, and the decrease of the area of the Northwest Territories, effected by the Boundary Extension Acts of 1912, are shown below, together with the present area and the population adjusted to the 1911 census:

	<i>Increase Sq. m.</i>	<i>Present area</i>	<i>Pop. '11</i>
Manitoba	178,100	251,832	461,630
Ontario	146,400	407,262	2,527,292
Quebec	354,961	706,834	2,005,779
Northwest Territories. *	679,461	1,242,224	5,900

* Decrease.

The average density of population in 1911, calculated upon the total of 3,729,665 square miles, was 1.93 per square mile. Density per square mile by provinces: Prince Edward Island, 42.91; Nova Scotia, 22.98; New Brunswick, 12.61; Ontario, 9.67; Manitoba, 6.18; Quebec, 5.69 (figures for the last three provinces are calculated on the area as before the changes of 1912); Saskatchewan, Alberta, and British Columbia, each less than 2 per square mile.

Division of the 1911 population into urban and rural gives 3,280,964 of the former (45.53 per cent) and 3,925,679 of the latter (54.47 per cent). It should be pointed out that the urban population includes the inhabitants of certain places which, in some classifications, would have been regarded as rural. The urban total includes 90,284 inhabitants of places with a population less than 500; 180,784 dwelling in towns with a population between 500 and 1000; 429,553 in towns between 1000 and 3000; and 226,212 in towns between 3000 and 5000. But of the total population in 1911, 2,354,131 persons, or 32.70 per cent, were dwelling in cities or towns with a population exceeding 5000. In the older parts of the Dominion there is a marked trend of population from country to town, and the urban increase is one of the most striking features revealed by the 1911 census. While during the decade 1901-11 the rural population increased by 576,163, or 17.20 per cent, the urban population increased by 1,259,165, or 62.28 per cent. In the Maritime Provinces and in Ontario the urban population increased at the expense of the

rural, for the latter actually declined, in Prince Edward Island by 10.81 per cent, in Nova Scotia by 7.26, in New Brunswick by 0.58, and in Ontario by 4.18. At the same time, the urban increase was 0.1 per cent in Prince Edward Island, 45.43 in Nova Scotia, 28.81 in New Brunswick, and 41.93 in Ontario. In 1911, Montreal had 14.34 per cent of the urban and 6.53 per cent of the total population of the Dominion; Toronto, 11.48 and 5.22; Winnipeg and Vancouver together, 7.21 and 3.28; Ottawa, Hamilton, and Quebec, 7.55 and 3.44. The 1911 census figures for the larger cities are as follows: Montreal, 470,480; Toronto, 376,538; Winnipeg, 136,035; Vancouver, 100,401; Ottawa, 87,062; Hamilton, 81,989; Quebec, 78,710; Halifax, 46,619; London, 46,300; Calgary, 43,704; St. John, 42,511; Victoria, 31,660; Regina, 30,213; Edmonton, 24,900; Brantford, 23,132; Kingston, 18,874; Maisonneuve, 18,684; Peterborough, 18,380.

Males in 1911 numbered 3,821,995, and females, 3,384,648, the number of females to each 1000 males being 886, as compared with 952 in 1901. The deficiency of females as compared with males is probably greater in Canada than in any other country. The number of females per 1000 males is 888 in Ceylon, 896 in New Zealand, 926 in Australia, 941 in the Union of South Africa, 943 in the United States, 953 in India, 1004 in Ireland, 1017 in Belgium, 1019 in Hungary, 1021 in Holland, 1026 in Germany, 1031 in Switzerland, 1033 in France (in 1901), 1036 in Austria, 1046 in Sweden, 1061 in Denmark, and 1063 in Scotland.

In 1911, unmarried males and unmarried females numbered 2,369,766 and 1,941,886 respectively; married, 1,331,853 and 1,251,468; widowed, 89,154 and 179,656; divorced, 839 and 691; legally separated, 1286 and 1584; not specified, 29,097 and 9363.

Of the total increase in population from 1901 to 1911, viz., 1,835,328, persons of English blood numbered 562,251 (30.63 per cent); Irish, 61,663 (3.36); Scotch, 197,726 (10.77); Welsh, 11,754 (0.06); French, 405,519 (22.09); German, 82,819 (4.51); Austro-Hungarian, 110,925 (6.05). Persons of British origin numbered 3,896,985, or 54.08 per cent of the total population in 1911. English blood made up 25.30 per cent; Irish, 14.58; Scottish, 13.85. Persons of French origin numbered 2,054,890, or 28.51 per cent of the total in 1911; German, 393,320 (5.46 per cent); Austro-Hungarian, 110,925 (1.79); Scandinavian, 107,535 (1.49); Indian, 105,492 (1.46); Jewish, 75,681 (1.05); Dutch, 54,986 (0.76); Italian, 45,411 (0.63).

Of the population in 1911, 5,619,682 (77.98 per cent) were born in Canada; 784,526 (10.89) in the British Isles; 29,188 (0.41) in British possessions other than Canada; and 19,708 persons (0.27 per cent) were of British birth but unknown birthplace. Foreign-born inhabitants numbered 404,941 (10.44 per cent), Europe being the birthplace of 5.62 per cent; Asia, 0.57; the United States, 4.21. Persons born in Austria-Hungary numbered 121,430 (1.68 per cent); Russia, 100,971 (1.40); Germany, 39,577 (0.55); Norway and Sweden, 49,194 (0.68); Italy, 34,739 (0.48); France, 17,619 (0.24); China, 27,083 (0.38); Japan, 8425 (0.12); the United States, 303,680 (4.21).

In 1911, males and females respectively under 5 years of age numbered 448,219 and 439,264; 5 to 14, 749,956 and 733,608; 15 to 24, 737,099

and 649,564; 25 to 44, 1,151,726 and 919,042; 45 to 64, 538,703 and 469,016; 65 and over, 169,605 and 164,158; age not given, 26,687 and 9996; total, 3,821,995 and 3,384,648; total population, 7,206,643. Total estimated population, March 31, 1914, 8,075,000.

Immigrants into Canada during the period 1901-15 numbered 3,050,811. In the year ended March 31, 1915, there were 144,789; in 1914, 384,878; in 1913, 402,432; in 1912, 354,237; in 1911, 311,084; in 1910, 208,794. Of the 384,878 immigrants in the year 1913-14, 66,502 were children, and of the remainder 224,348 were males and 94,028 were females; of the total number, 107,530 came from the United States. Immigrants whose destination was the Maritime Provinces in 1913-14 and 1914-15 respectively, 16,730 and 11,104; Quebec, 80,368 and 31,053; Ontario, 123,792 and 44,873; Manitoba, 41,640 and 13,196; Saskatchewan, 40,999 and 16,173; Alberta, 43,741 and 18,263; British Columbia, 37,608 and 10,127; total, 384,878 and 144,789.

RELIGION AND EDUCATION. Religions numbering 5000 or more adherents in 1911 were as follows:

Religions	Adherents		Increase per cent
	1901	1911	
Adventists	8,058	10,406	29.14
Anglicans	681,494	1,053,017	53.05
Baptists	318,005	382,666	20.33
Brethren	8,014	9,278	15.77
Buddhists	10,407	10,012	-3.80
Christian Scientists	2,619	5,073	93.70
Christians	6,900	16,773	143.09
Confucians	5,115	14,562	184.69
Congregationalists	28,293	34,054	20.36
Disciples	14,900	11,329	-23.96
Doukhobors	8,775	10,493	19.58
Evangelicals	10,193	10,595	3.94
Greek Church	15,630	88,507	466.26
Jews	16,401	74,564	354.63
Lutherans	92,524	229,864	148.43
Mennonites	31,797	44,611	40.30
Methodists	916,866	1,079,892	17.78
Mormons	6,891	15,971	131.77
No religion	4,810	26,027	441.10
Pagans	15,107	11,840	-21.63
Presbyterians	842,442	1,115,324	52.39
Protestants	11,612	30,265	160.64
Roman Catholics	2,229,600	2,833,041	27.06
Salvation Army	10,808	18,834	82.71
Unspecified	48,222	82,490	-24.88
Total of 5,000 and over	5,840,003	7,159,488	34.07

Of the population six years of age and over in 1911, viz., 6,154,511, the number returned as being unable to read was 521,842, or 8.48 per cent. The number of persons between the ages of 5 and 20 at the date of the 1911 census was 2,306,558; of this number, 1,147,838, or 49.76 per cent, attended school for some period during 1910. In general there are two fundamental systems of education in Canada, one that of the Protestant communities, free from the control of religious bodies, and the other that of the Roman Catholic French and Irish communities, in which education is united with the religious teaching of the Roman Catholic Church. In Ontario, Quebec, Saskatchewan, and Alberta, Roman Catholics have the right to form "separate schools" for elementary education, the local rates for the support of these schools being separately levied and applied. In the remaining provinces, there are separate schools for Roman Catholics in the larger cities and towns. In all the provinces, the cost of education is defrayed from the public revenues, provincial and local,

and public elementary education is free except for certain small fees payable in parts of Quebec. Excepting Quebec all the provinces have compulsory education laws. The following table shows, for 1914, number of schools, of teachers, and of pupils enrolled, the percentage of average attendance, and the expenditure for public education (year ended December 31 for Alberta, Ontario, Prince Edward Island, and Saskatchewan; July 31 for Nova Scotia; and June 30 for British Columbia, Manitoba, New Brunswick, and Quebec):

	Schools	Teachers	Enroll.	Av. at.	Expend.
Alta. ...	2,027	3,978	89,910	60.71	\$7,884,891
B. C. ...	682	1,733	58,950	78.97	4,634,877
Man. ...	2,688	2,864	93,954	63.60	6,079,720
N. B. ...	1,922	2,032	64,310	63.57	986,683
N. S. ...	2,724	2,892	106,351	62.60	1,510,079
Ont. ...	6,548	11,546	498,888	64.66	*12,325,907

P. Q. ...	5,827	7,895	234,260	75.82	7,623,856
Sask. ...	2,966	5,140	118,927		8,327,178

* For elementary schools.

AGRICULTURE. The area estimated as under field crops in 1914 was 35,102,175 acres, as compared with 35,375,430 acres in 1913; but owing to the drought the productive area in 1914 was reduced to 33,436,675 acres. Upon this area the total value of all field crops, including roots and fodder, computed at average local market prices, amounted to \$638,580,300, as compared with \$552,771,500 in 1913, the increase of \$85,808,800 being due chiefly to the enhancement of prices caused by the war. The average prices per bushel of the principal grain and fodder crops in 1913 and 1914 respectively were as follows: Wheat, 67 cents and \$1.22; barley, 42 and 60 cents; rye, 66 and 83 cents; oats, 32 and 48 cents; peas, \$1.11 and \$1.46; beans, \$1.88 and \$2.31; buckwheat, 64 and 72 cents; mixed grains, 55 and 66 cents; flaxseed, 97 cents and \$1.03; corn for husking, 64 and 71 cents. For hay and clover the average prices per ton in 1913 and 1914 were \$11.48 and \$14.23; fodder corn, \$4.78 and \$4.91; alfalfa, \$11.85 and \$14.17. Of wheat, the total estimated yield in 1914 was 161,280,000 bushels from a productive area of 10,293,900 acres, as compared with 231,717,000 bushels in 1913 from 11,015,000 acres, the average yield per acre in 1914 being 15.67 bushels, against 21 bushels in 1913. Fall wheat gave a total yield in 1914 of 20,837,000 bushels from 973,300 producing acres, as compared with 22,592,000 bushels from 973,300 producing acres in 1913; average per acre, 23.29 and 21.14 bushels. The yield of spring wheat in 1914 was 140,443,000 bushels, from 9,320,600 acres, the average per acre being 15.07 bushels. In 1913 the corresponding figures for spring wheat were 209,125,000 bushels, 10,045,000 acres, and 20.81 bushels per acre. In the table below are given the area in acres planted to principal crops in 1914, the yield in bushels or tons, and the value:

Crops	Acres	Bushels	Value
Wheat	10,293,900	161,280,000	\$196,418,000
Oats	10,061,500	318,078,000	151,811,000
Barley	1,495,600	86,201,000	21,557,000
Rye	111,280	2,016,800	1,679,800
Peas	205,550	3,362,500	4,895,000
Beans	48,830	797,500	1,844,800
Buckwheat ...	854,400	8,626,000	6,213,000
Mixed grains ...	463,800	16,382,500	10,759,400
Flaxseed	1,084,000	7,175,200	7,868,000
Corn *	256,000	13,924,000	9,808,000
Potatoes	473,900	85,672,000	41,598,000
Turnips, etc. .	175,000	69,003,000	18,934,000

Crops	Acres	Tons	Value
Hay and clover	7,997,000	10,259,000	145,999,000
Fodder corn ..	817,000	8,251,480	15,949,700
Sugar beets ..	12,100	108,600	651,000
Alfalfa	90,815	218,360	8,095,600

* For husking.

Total areas and values of field crops by provinces in 1913 and 1914:

	Acres		Value	
	1913	1914	1913	1914
Alta.	8,690,100	8,369,270	\$46,712,000	\$59,779,600
B. C.	238,700	280,640	11,069,000	11,463,000
Man.	4,965,500	4,671,790	64,557,000	65,528,400
N. B.	906,180	904,055	17,965,100	20,045,100
Ont.	9,200,000	8,973,700	167,835,000	196,220,000
P. E. I.	456,970	461,510	9,535,500	11,544,000
P. Q.	4,898,800	4,863,850	88,589,000	99,279,000
Sask.	10,307,600	9,238,000	129,376,000	152,751,500
TL.	85,375,430	83,486,675	\$552,771,500	\$638,580,300

In the table below are shown the producing area and the yield of wheat, oats, and barley in the Northwest Provinces in 1913 and 1914:

Manitoba:			
	Wheat	Oats	Barley
Acres ...	1913 2,804,000	1,398,000	496,000
	1914 2,616,000	1,381,000	468,000
Bushels .	1913 58,881,000	56,759,000	14,805,000
	1914 58,605,000	31,951,000	9,828,000
Saskatchewan:			
Acres ...	1913 5,720,000	2,755,000	882,000
	1914 5,348,800	2,520,000	290,000
Bushels .	1913 121,559,000	114,112,000	10,421,000
	1914 73,494,000	61,816,000	4,901,000
Alberta:			
Acres ...	1913 1,512,000	1,639,000	197,000
	1914 1,371,000	1,502,000	178,000
Bushels .	1913 84,372,000	71,542,000	6,384,000
	1914 28,859,000	57,076,000	4,806,000

In 1914 the producing area in the Northwest Provinces was reduced by drought to the figures given above by 723,100 acres planted to wheat, 753,000 acres oats, and 102,000 acres barley.

Estimated live stock on farms June 30, 1913, and June 30, 1914, respectively: Horses, 2,866,008 and 2,947,738; milch cows, 2,740,434 and 2,673,286; other cattle, 3,915,687 and 3,363,531; sheep, 2,128,531 and 2,058,045; swine, 3,448,326 and 3,434,261. The 1911 census returned 2,598,598 horses, 2,595,255 milch cows, 3,930,828 other cattle, 2,174,300 sheep, and 3,634,778 swine.

FISHERIES. The stated value of all kinds of fish, fish products, and marine animals taken in both sea and inland fisheries was \$33,389,464 in the year 1912-13, and \$33,207,748 in 1913-14. Value by provinces in 1913-14: Prince Edward Island, \$1,280,447; Nova Scotia, \$8,297,626; New Brunswick, \$4,308,707; Quebec, \$1,850,427; Ontario, \$2,674,685; Manitoba, \$606,272; Saskatchewan, \$148,602; Alberta, \$81,319; British Columbia, \$13,891,398; Yukon, \$68,265.

HOMESTEADS. In 1914 the total number of ordinary homestead entries for lands of the Dominion government was 25,623, as compared with 31,499 in 1913, 35,538 in 1912, and 38,909 in 1911. In 1914, 4205 entries were made in Manitoba (against 2998 in 1913), 9752 in Saskatchewan (against 14,524), 10,772 in Alberta (against 12,122), and 847 in British Columbia (against 1855). The number of preëmptions under the Dominion Lands Act was 3262 in 1914 (2417 in Saskatchewan and 1772 in Alberta). The number of purchased homesteads under the Act was 422 in 1914 (290 in Saskatchewan, 132 in Al-

berta), against 786 in 1913 (534 in Saskatchewan, 252 in Alberta).

MINING. The total value of the mineral production in 1914 was \$128,475,499 (preliminary report of the Dominion Department of Mines), as compared with the finally revised total of \$145,634,812 for 1913. The total value of the metallic production in 1914 was \$58,870,028, as against \$66,361,351 in 1913, the decrease being \$7,491,323, or 11 per cent. Non-metallic products were valued at \$69,605,471 in 1914, as against \$79,273,461 in 1913, the decrease being \$9,667,990, or 12.19 per cent. The decrease was most pronounced in the case of coal, asbestos, and gypsum, and of products generally classed as structural materials, such as cement, brick, sewer pipe, and lime.

Value of the mineral output by provinces, with percentage of totals:

	1913		1914	
	\$	P.c.	\$	P.c.
N. S.	19,376,183	13.30	17,514,786	13.68
N. B.	1,102,613	0.76	1,084,706	0.81
P. Q.	13,475,534	9.25	12,259,687	9.54
Ont.	59,167,749	40.68	52,147,978	40.59
Man.	2,214,496	1.52	2,428,902	1.89
Sask.	881,142	0.60	710,840	0.55
Alta.	15,054,046	10.34	12,778,669	9.94
B. C.	28,086,312	19.29	24,202,924	18.84
Yukon	6,276,787	4.81	5,402,062	4.21
Total	145,634,812	100.00	128,475,499	100.00

The decline in production in 1914 is ascribed in large measure to conditions resulting from the war. The cutting off of markets and the closing of metal exchanges, with the consequent cessation of market quotations, resulted in the closing down or restriction of operation at many properties.

The following table shows the quantities (in thousands) and the values (in thousands of dollars) of minerals produced in Canada in 1913 and 1914:

	Quantities (1000)		Dollars (1000)	
	1913	1914	1913	1914
Copper, lb.	76,977	75,738	11,754	10,302
Gold, oz.	803	770	16,599	15,925
Pig iron, tons	1,129	783	16,540	10,008
Lead, lb.	37,668	36,338	1,755	1,628
Nickel, lb.	49,677	45,518	14,908	13,655
Silver, oz.	31,845	27,544	19,041	15,097
Other metallic products			1,214	1,224
Total			81,905	67,784
Less pig iron from imported ores, tons 1,055	687	15,544	8,864

Imports of merchandise for consumption and exports of Canadian merchandise, in fiscal years:

	1910	1913	1914	1915
Imps.	369,815,427	670,089,066	618,457,144	455,446,312
Exps.	279,247,551	355,754,600	431,588,439	409,418,836

One of the consequences of the great war was the transfer to Canada, in trust for Great Britain, of gold from the United States. Imports of coin and bullion increased from \$15,235,305 in 1913-14 to \$131,992,992 in 1914-15. Exclusive of coin and bullion, the external trade of Canada in the fiscal year ended March 31, 1915, amounted to \$958,894,411, as compared with \$1,090,948,716 in 1913-14, the decrease being 12.1 per cent. Of the total value, exports amounted to \$461,442,509 in 1914-15, as compared with \$455,437,224 in 1913-14, and imports to \$497,451,902, as compared with \$635,511,492, the increase in the exports being 1.3 per cent, and the decrease in the imports, 21.7 per cent. It should be noted that values were affected by variation in prices due to the war, especially, in the case of exports, to the rise in the prices of grain and flour. It should also be noted that the decline in the value of imports began before the outbreak of the war. For every month of the year ended March 31, 1915, the imports were of less value than in the corresponding month of the previous year.

The principal imports for consumption, in the fiscal year 1914 and 1915 respectively, were as follows, in thousands of dollars: Live animals, 2515 and 1228; books, maps, pamphlets, periodicals, etc., 6754 and 5854; breadstuffs, 9426 and 13,982; carriages, automobiles, bicycles, etc., 20,098 and 8523; coal, coke, etc., 49,036 and 38,620; cotton and manufactures thereof, 37,601 and 27,399; drugs, dyes, chemicals, and medicines, 14,638 and 13,449; earthenware and china, 3131 and 1941; electrical apparatus, 8924 and 6036; fancy goods, 4879 and 3176; fish, 2173 and 1706; flax, hemp, jute, and manufactures thereof, 8963 and 6428; fruits, 17,233 and 15,469; glass and manufactures thereof, 5075 and 3524; rubber, gutta-percha, and manufactures thereof, 8994 and 7767; hats, caps, etc., 5452 and 3789; hides and skins other than fur, 8831 and 12,843; leather and manufactures thereof, 8454 and 7059; total metals, minerals, and manufactures thereof, 148,383 and 84,366; (iron and steel, and

manufactures thereof, 119,322 and 64,759; copper and manufactures thereof, 6581 and 3561; brass and manufactures thereof, 4415 and 2949; tin and manufactures thereof, 6358 and 4791; oils, 17,095 and 13,345; paints and colors, 2161 and 1572; paper and manufactures thereof, 8043 and 5764; provisions, 10,813 and 5935; seeds, 1671 and 2365; settlers' effects, 14,348 and 7864; silk and manufactures thereof, 9689 and 8139; spirits and wines, 7047 and 5331; sugar, molasses, etc., 17,949 and 19,033; tea, 6650 and 7364; tobacco, 6899 and 5801; vegetables, 3307 and 3039; wood and manufactures thereof, 24,676 and 14,506; wool and manufactures thereof, 31,438 and 24,839.

Exports of Canadian produce, in fiscal years, are shown below by great classes, values in dollars:

* Coin and bullion included was \$15,220,768 in 1913-14 and \$131,984,421 in 1914-15.

COMMUNICATIONS. The length of railway in operation June 30, 1914, was 30,795. The increase in mileage during the year then ended was 1491, as compared with 2577 in 1913, 1327 in 1912, and 669 in 1911. In the fiscal year 1914, aggregate railway earnings were \$243,083,539, showing a decrease of \$13,619,164, or 5.6 per cent, as compared with the previous year. Operating expenses in 1913-14 amounted to \$178,975,259, showing a decrease of \$3,036,431, or 1.7 per cent, from the total of the previous year. During 1913-14 the sum of \$276,990,069 was added to the capital liability of steam railways in operation, including stocks, \$97,794,137, funded debt, \$169,145,686, and consolidated debenture stock of the Canadian Pacific Railway, \$10,050,246. These additions bring the total capitalization of steam railways in operation to \$1,808,820,761 on June 30, 1914. If the capitalization of railways under construction be added to that of the operating railways, the total is increased to \$1,962,128,070, of which \$917,748,153 are stocks, \$173,307,470 are consolidated debenture stock, and \$871,072,447 are funded debt.

The following table shows the mileage of Canadian steam railways by provinces at the end of fiscal years:

	1909	1913	1913	1914
Ontario	8,229	8,546	9,000	9,255
Quebec	3,663	3,882	3,986	4,043

Total	24,014	26,727	29,804	30,795

The report of the Comptroller of Railways Statistics of the Dominion of Canada, issued in 1915, showed that the operating railway mileage on June 30, 1914, was 30,795 miles, which represented an increase of 1492 miles during the fiscal year of 1914, the greatest annual gain from 1908 to 1914 inclusive, barring 1913, when 2575 were added. Ontario led the provinces with 9255 miles of track; Saskatchewan was second, with 5089 miles, of which 438 were added in 1914. In addition to the lines under operation, 11,472 miles were surveyed throughout the Dominion in 1914. Under contract were 5521 miles, and 3417 were completed but not in operation. The bulk of this mileage was in the western provinces, where Alberta had 805 miles under contract, and 1189 miles completed but not in operation; British Columbia 1235 under contract, and 698 completed; Saskatchewan 340 miles under contract, and 555 miles completed; and Manitoba 108 miles under contract, and 134 miles completed. Ontario had 1841 miles under contract, and 836 completed but not in operation. The capital spent during the year was \$276,990,069, and the total capital expenditure was \$1,808,820,961. The ratio of operating expenses to gross earnings was 73.63 per cent. There

were 150,142 employees, to whom had been paid \$111,762,972 during the year.

During 1915, 718.7 miles of new first track was completed in the Dominion of Canada, and .84 miles of second track. This is a decrease over the record for 1914 and is due to the fact that the European war seriously interfered with all construction activities. The 718 miles of line completed was nearly all work which was far advanced. Thus the Pacific Coast extension of the Canadian Northern was placed in service during the year. On other lines the extension had taken place so rapidly in other years that there was no necessity for great extension, especially in Western Canada, as in many districts the railway facilities were in advance of the settlement of the country. The Canadian Pacific western lines, which reported a total of 574 miles built in 1914, reported only 23 miles opened in 1915.

On Nov. 22, 1915, the Canadian Northern Railway ran the first train on its Pacific Line from Edmonton to Vancouver, B. C., thus making the third Canadian transcontinental railway to be in operation. The Canadian Northern Railway follows the valley of the Athabasca and Miette rivers to the summit of the Yellowhead Pass, whence it runs westerly along Yellowhead Lake down the Fraser River and across the head of Cranberry Lake, beyond which it rises to the Albreda Summit at an elevation of 2861 feet. Thence it follows the Albreda River to the North Thompson, which it runs along with as far as Kamloops, and thence the Thompson River to Lytton, and the Fraser River to the coast. From Kamloops the new line parallels the Canadian Pacific Railway. The railway company has established a new city and port at Port Mann, but the line runs beyond this to Vancouver, whence a car ferry will transfer across to Patricia Bay on Vancouver Island, so that track connection can be maintained with Victoria, B. C., making this the terminal port for the Pacific steamers instead of Vancouver. The Pacific Coast section of the three Canadian transcontinental railways is as follows:

Railway	Winnipeg to	Miles	Max. Elev. Ft.	Max. Grade P.c.
Can. Northern	Vancouver	1,610	8,711	0.7
Grand Trunk Pac.	Prince Rupert	1,754	8,724	1.0
Canadian Pacific	Vancouver	1,484	5,321	2.2*

* Reduced from the original grade of 4.2 per cent.

FINANCE. The system of Canadian public finance includes a consolidated fund and miscellaneous accounts. To the consolidated fund are paid in the revenues, and out of it are paid the expenditures, properly relating to the fiscal year. The miscellaneous accounts comprehend loans, debt redemption, railway administration, capital expenditure on public works, etc. For fiscal years ended March 31st, the expenditure and the revenue of the Dominion government are shown in the following table. The several items are indicated as follows: *a* expenditure chargeable to consolidated fund; *b* expenditure chargeable to capital; *c* railway subsidies; *d* other charges; *e* total disbursements; *f* revenue on account of consolidated fund; *g* other revenues; *h* total revenue; *i* difference between receipts and disbursements; *j* sinking funds; *k* net difference between receipts and disbursements.

k	*12,388,267	†122,591	†26,617,885	*21,695,224

* Net excess of expenditure † Net excess of receipts.

Receipts from customs in 1912-13 and 1913-14 respectively, \$111,764,699 and \$104,691,238; from excise, \$21,447,445 and \$21,452,037. The interest on the public debt in 1912-13 was \$12,605,882, and in 1913-14, \$12,893,505. The public debt, March 31, 1914, was \$544,391,389; assets, \$208,394,519; net debt, \$335,996,850.

ARMY. The Ministry of Militia, under Gen. Sir Samuel Hughes, K. C. B., had been actively engaged since the outbreak of the war in recruiting, equipping, and sending forward the volunteer forces of the Dominion. The annual expenditure in 1915 in this respect was estimated at some \$175,000,000. The army service corps had transported 114,249 men of all ranks since the outbreak of the war, and 26,562 remounts had been purchased, of which 23,155 had been shipped to Europe. The Canadian Ordnance Corps had purchased 600,000 pairs of boots, 400,000 caps, 600,000 shirts, 600,000 suits of underclothing, 49 armored cars, 1800 transport wagons, 280 other transport vehicles, 6000 sets of harness, 350 motor trucks, 40 ambulances, 143 motor cycles, 1400 bicycles, 8700 binoculars, 3850 telescopes, 110,000 Ross rifles, 500,000 automatic pistols. The expenditures for horses had totaled \$4,163,000. Ocean transport of troops and supplies \$6,780,000. To the Shell Committee \$5,000,000 had gone for shells for the Canadian artillery, and other expenses had been in proportion. The Canadian Defence Ministry decided that the volunteer army of Canada in the field should be increased to a maximum of 500,000 men, which would require the enlistment of some 275,000 more men, and would doubtless involve an annual expenditure for military purposes alone of \$400,000,000.

The Canadian losses for the first contingent as reported were 1213 killed, 5230 wounded and 1565 missing. Up to October 16th the number of casualties totaled 667 officers and 14,510 enlisted men. The Canadian infantry regiments fighting in Belgium suffered severely, and of 12 infantry battalions engaged in the three days fighting around Ypres over 70 per cent were killed or wounded, so that replacements were necessary, which in the main came from promotion on account of the enlisted personnel. It was proposed to start an officers' training school at Niagara. It was reported early in the year that 30,000 of the Canadians were in Belgium, another 30,000 ready to sail, and a third contingent was making ready. Later in the year the Canadian Minister of Militia announced that an effort would be made to raise 27 additional regiments of infantry, and six batteries of artillery, or about 35,000 men, which would bring the Canadian forces to about 150,000.

Little difficulty was experienced in recruiting the volunteer organizations, and many unemployed and college students were anxious to enlist. The second contingent of volunteers was delayed on account of outbreaks of contagious diseases in the training camps, and criticism was heard of mismanagement and faulty supplies.

NAVY. The Naval Service Department was established in 1910, and subsequently programmes of construction were introduced but failed of enactment. The only ships of fighting value are the cruisers *Niobe* (11,000 tons) and *Rainbow* (3000), and two submarines. The submarines had been completed in 1914 for Chile, and soon after the outbreak of the war they were purchased by Canada and, together with the cruisers, placed at the disposal of the Imperial government. There are a number of small vessels for fishing protection duty, revenue and surveying services, etc.

GOVERNMENT. The executive authority is exercised in the name of the King of Great Britain and Ireland by an appointed Governor-General acting through a privy council, or responsible ministry. The legislative power is vested in a Parliament of two houses, the Senate and the House of Commons. Senators, nominated for life by the Governor-General, are 87 in number; in the next Parliament they will number 93. Members of the House of Commons—now 226 in number—are elected by popular vote and hold office for five years unless the Parliament is sooner dissolved; in the next Parliament they will number 234, apportioned as follows: Quebec, 65; Ontario, 82; Prince Edward Island, 3; Nova Scotia, 16; New Brunswick, 11; Manitoba, 15; Saskatchewan, 16; Alberta, 12; British Columbia, 13; Yukon Territory, 1. The Governor-General in 1915 was Prince Arthur, Duke of Connaught (brother of Edward VII), who assumed office Oct. 31, 1911. The Conservative ministry of Sir Robert Laird Borden, which succeeded the Liberal ministry of Sir Wilfrid Laurier Oct. 10, 1911, was composed as follows in 1915: Premier and president of the council, Sir Robert Laird Borden; minister of trade and commerce, Sir George Eulas Foster; public works, Robert Rogers; railways and canals, Francis Cochrane; finance, William Thomas White; marine and fisheries, John Douglas Hazen (also minister of the naval service); justice, Charles Joseph Doherty; militia and defense, Sir Samuel Hughes; interior, William James Roche; labor, Thomas Wilson Crothers; customs, Dr. John Dowsley Reid; agriculture, Martin Burrell; mines, Pierre Edouard Blondin; inland revenue, Esioff Léon Patenaude; ministers without portfolios, Sir George Halsey Perley, Albert Edward Kemp, and James Alexander Loughheed; postmaster-general, Thomas Chase Casgrain; solicitor-general (not in the Cabinet), Arthur Meighen.

Each of the provinces has an elected Legislature, and an executive (Lieutenant-Governor) appointed by the Governor-General and acting through a responsible ministry.

HISTORY

RELATIONS WITH THE UNITED STATES. Relations between the United States and Canada remained friendly throughout the year, notwithstanding the fact that on several occasions com-

plications of a serious nature arose. The most serious of these questions was the "Niagara Fisheries" case. On Dec. 28, 1914, two American citizens, Walter Smith and Charles Dorsch, both of Buffalo, N. Y., rowed across the Niagara River at Buffalo and began to fish in Canadian waters at Fort Erie. Provincial Constable T. W. Delaney demanded that the young men come ashore and surrender and when they began to row in the opposite direction he called upon Corp. Archie Kay and Privates Kinsman and McIntosh for assistance. An order was given to fire in the air in the direction of the boat, but two shots went true, killing Smith and seriously wounding Dorsch. The coroner's jury rendered a verdict of accidental shooting, but the families of the two men appealed to the American government for redress. On January 7th Canada voluntarily accepted blame for the shooting. This action was taken on the initiative of the Ottawa government before the American government had time to enter a protest. On January 22nd, at the same time that the Ontario provincial government made preparations to prosecute the soldiers, the Dominion government announced that it would defend them on the advice of the war department. Under an agreement reached at Washington on February 1st Canada paid \$10,000 to the family of Smith and \$5000 to the family of Dorsch and expressed regrets for the incident. At the same time the Dominion government held that such action on her part was entirely voluntary and that it in no way admitted responsibility for the incident. On March 2nd the grand jury at Welland, Ont., returned no bill against the constable and soldiers who were being tried in connection with the Fort Erie case. This ended the matter which for a time caused great excitement along the Canadian and American frontiers.

VAN HORN CASE. Another complication of international importance was the Van Horn case. On February 2nd Werner Van Horn, a German reservist officer, endeavored to blow up the Canadian Pacific Railway Bridge crossing the St. Croix River at Vanceboro, Me. Early in the morning Van Horn crossed to the Canadian side of the bridge and planted a charge of dynamite. The explosion of the charge did little damage to the bridge, but wrecked windows in all the buildings in Vanceboro. Van Horn was arrested, and Canadian authorities put in an application for his extradition to Canada. The prisoner resisted the demand for extradition on the ground that he was a German army officer, had committed an act of warfare against Canada, and was, therefore, a political prisoner and not subject to extradition. The American authorities were inclined to believe that Van Horn could be extradited by means of a clause in its treaties with Canada which provides for extradition of persons who attempt to destroy railroad bridges, or that if this course failed he could be tried on the charge of violating American neutrality. Awaiting a decision on these matters, Van Horn was sentenced to 30 days in jail for breaking windows in Vanceboro by means of his dynamite charge under the bridge. On February 4th the German Embassy took notice of the proceedings, the counselor of the Embassy calling at the State Department in Washington for details of the charges against Van Horn. Late in the month the Federal Grand Jury in Boston took up the case to see if it

would be possible to charge Van Horn with having carried explosives illegally from one State into another. On March 2nd he was indicted by the Grand Jury on three charges of this nature. In the meantime Captain Boy-Ed, German naval attaché, was accused of instigating Van Horn in his attempt to destroy the railway bridge. Captain Boy-Ed claimed the rumor to be without foundation. The prisoner was transferred to Federal jurisdiction on March 7th and taken to Boston to stand trial on the charges named in the indictment. Van Horn contested his removal, but a Federal commission decided against him. Counsel for the prisoner also tried to obtain a writ of habeas corpus, but this was denied by two Federal judges. Several postponements of the case finally brought it to the September session of the Federal courts. On August 17th an Eastern newspaper printed the story of an alleged confession of Van Horn. This confession implicated leading German officials. Van Horn denied its authenticity, but the newspaper insisted that the original of the confession was in the hands of the Department of Justice in Washington. On September 28th Van Horn took appeal from the Federal decision charging illegal transportation of explosives from State to State. Van Horn questioned the regularity of the extradition proceedings and the refusal of the court to permit him to invoke the law of nations, or present his commission as an officer in the German army, while he also claimed a general error on the part of all the judges and magistrates who had been connected with the case.

The Canadian government decided to await the result of the United States' action against Van Horn before pushing the Canadian claims for his extradition.

TRADE RELATIONS WITH THE UNITED STATES. A rumor circulated late in January charged Canada with boycotting American goods. This rumor was indignantly denied by the Canadian government, although it was generally admitted that Canadians were offended because the United States had taken no action in the case of Belgium or the *Lusitania*. On September 23rd Canada issued an unusual order when she threw open Canadian ports on the Great Lakes to ships of American or other registry. Previously Canada had compelled all ships in the carrying trade to bear Canadian registry. The necessity of removing the grain, however, from the Superior region to the Atlantic coastline and the shortage of Canadian ships, due to the number which were being used in transporting munitions to Europe, made it necessary for the Dominion government to let down the barriers which previously had kept American ships out of this lucrative trade.

ECONOMIC CONDITIONS IN CANADA. The European war had a far-reaching effect on the internal conditions of the Dominion. Its greatest effect was on the finances of the country. Early in January the city of Montreal found it necessary to issue bonds for nearly \$7,000,000, part of which were bought by New York financial houses. In the middle of January the Province of Alberta listed \$5,000,000 of 4½ per cent ten-year debentures on the New York Stock Exchange. This was the first time in the history of the relations between the United States and Canada that Dominion bonds had been listed on the exchange. Early in February a New York

financial firm purchased \$5,475,000 in 5 per cent bonds of Manitoba. On March 29th announcement was made in London of a Canadian loan of £5,000,000, secured by five- and ten-year bonds. On July 22nd the Dominion government sold \$45,000,000 of 5 per cent notes to a New York syndicate. Of this amount \$25,000,000 was to run for one year, and the rest for two years. It was the first time that the Canadian Dominion government ever had made a loan in the United States. That the people of the United States had faith in their Canadian neighbors was shown by the fact that within three days the loan was three times oversubscribed. In the middle of September the National City Bank of New York loaned \$2,500,000 in a private transaction to the city of Toronto. In November the Dominion government floated a war loan of \$50,000,000, which was oversubscribed by \$60,000,000. The Canadian banks were in a much stronger position by September than they had been the year previous, and were able to offer better credit accommodation to grain and other brokers. By the Canadian Finance Act of 1914 (see YEAR BOOK, 1914) the banks were able to create additional liquid capital by issuing Dominion notes against grain bills, warehouse receipts, and other paper securities. A proposal in January to increase Canadian freight rates in comparison with an increase on American roads met with objections on the part of the government. In the last of March the Dominion government took over the operation of a railroad line running from Moncton, N. B., to Winnipeg, Man., a distance of 1800 miles. This road was built by the government for the Grand Trunk Pacific, which later declined to take over the lease. The decision on the part of the government to operate the road itself delayed a crisis which for a time appeared inevitable in Canadian railroad affairs. It appeared probable, however, that eventually the government would be compelled to take over several of the unprofitable roads which were constructed through barren parts of the country at a time when the financiers had a craze for railroad construction.

The Canadian government on November 27th commandeered all of the wheat in the district between Fort William on Lake Superior and the Canadian coast, a total amount of approximately 25,000,000 bushels. This was commandeered for government purposes, and to prevent it from getting into the hands of the enemies of Canada. Three days later, in response to the complaints of many dealers who had large contracts which could not be filled if all the wheat in the east was held up, part of the wheat was released for 60 days on condition that the dealers return it when requisitioned.

PARLIAMENT. Unusual methods were taken in February to protect the Duke of Connaught, Governor-General of Canada, at the opening of Parliament. At the first meeting on February 8th the Opposition announced that it would not object to the passage of war funds but that it would insist upon a strict accountance for the expenditures already made. On February 11th the government announced a drastic war taxation measure, affecting bank circulation, business of loan and fire insurance companies, business and banking transactions, railway and steamship tickets, telegraph and cable messages, and patent medicines. An increase in tariff duties was laid on all imports, although British

products were given a preferential rate. This increase in rates was expected to produce an extra \$30,000,000 of revenue which would partially offset the deficit of \$100,000,000 brought about by the war. The War Revenue Act was signed on April 8th and went into effect on April 15th. Parliament was prorogued on the same day. The Duke of Connaught, in closing the session, said:

"There is no abatement in the intense determination of the Canadian people to unite their efforts with those of all other British domains for the maintenance of the empire's integrity and for the preservation of its institutions and liberties. The response to the call for men has fully equaled all our anticipations. I have been proud to learn that the Canadian soldiers have shown conspicuous bravery and efficiency on the field of battle."

CANADA'S SHARE IN THE WAR. The first contingent of troops which Canada had sent to England was called to the firing line in France, January 30th, while the second contingent was already prepared in Canada, awaiting orders to embark for Great Britain. The first contingent received its baptism of fire the day after it reached the front, January 31st, when Princess Patricia's Light Infantry regiment helped the British defend the trenches near La Bassée. In March the second contingent sailed from Canada, to undergo a brief period of training in England and then to be sent to France. The Canadian troops distinguished themselves by their gallantry in the battle of Ypres (see *WAR OF THE NATIONS, Battle of Ypres*); for conspicuous acts of bravery at Ypres the Victoria Cross was presented to three Canadians—Captain Francis Sorringer of the Army Medical Service, Color Sergeant Fred Hall of the 8th Canadian battalion, and Corporal Fred Fisher of the 13th Canadian battalion. In May, the White Star liner *Megantic* carried a third division of soldiers to Europe. The Strathcona Horse and the Royal Canadian Dragoons were dismounted early in May and sent to France in conjunction with an English cavalry company as unmounted cavalry. More than 6000 Canadian troops had been killed, wounded, or captured at the battle of Ypres in May; by June this number had been increased to 8000; and by August the total casualties were well over 10,000. By October, Canada had in actual service over 100,000 troops, with 75,000 more in Canadian training camps waiting to be called to the front. The maximum of 150,000, which had been placed upon the number of Canada's overseas forces, was raised to 200,000 by the authority of the Dominion government, October 29th. The entire country responded to the appeals for more men to aid the cause of the Allies. In a majority of Canadian cities buildings and vehicles were placarded with patriotic posters demanding that Canada do her share of the fighting. McGill and other universities undertook to train student recruits and send them to the front. Volunteers who could not yet enlist for active service were given a preliminary military training in the summer camps which were established at Aldershot (N. B.), Sussex (N. B.), Valcartier (Que.), Barriefield, Niagara, and London (Ont.), Sewell (Man.), and Vernon (B. C.). Furthermore, a Canadian firm at Montreal, in January, began to construct submersibles for the Allies, and in July was able to send ten of these craft across

the Atlantic under the escort of two auxiliary cruisers.

GERMAN PLOTS IN CANADA. Numerous conspiracies on the part of Germans and Austrians in Canada were discovered and frustrated. Carl Mackensen, nephew of the famous German general of the same name, was arrested in Vancouver, B. C., January 14th, by order of the Canadian military authorities, who suspected him of treasonable activities. Mackensen and a German lawyer of Vancouver were lodged in jail pending the decision of their case. Later, in January, nine German prisoners of war escaped from the Halifax Citadel; four were recaptured, but the others eluded pursuit. As a precaution against German attempts to blow up Canadian shipping, the Dominion government issued orders to ships not to enter the port of Halifax or Quebec in case the warning signal of three red balls or lights in a vertical line was displayed. At the same time the government ordered all lights out in the Parliament buildings, Rideau Hall, the home of the Governor-General, and the Royal Mint, for fear of a night attack by aeroplanes, several of which had been seen to leave the American shore of Lake Ontario. The Dominion government also ordered a double watch at the Canadian end of the international bridge at Niagara Falls. In April an unofficial warning reached Canadians that the Atlantic coast was to be attacked by a German fleet. To meet this rumored attack it was reported that 44 British and French ships were dispatched to patrol the Atlantic coast of Canada as well as the Island of Newfoundland. It also was feared that the Germans might attempt to establish a submarine base on the Canadian coast to prey on British commerce in the Atlantic. Mobs in Victoria, in May, wrecked several German-owned buildings in avenging the destruction of the *Lusitania* and compelled the government to place the city under martial law before order could be restored. An attempt of 10 Austrians to blow up the Canadian Pacific Railway Bridge at Smiths Falls, Ont., on May 25th, was frustrated by soldiers, and the Austrians were taken into military custody. On the same day Vancouver interned 115 Austrians and Germans who had been employed for a year as strike-breakers in the Cumberland, Southfield, and Nanaimo mines. (See also the paragraph in this article on the *Van Horn Case, supra*.)

Regarding the exposure of corrupt political practices in Manitoba Province, see separate article on MANITOBA.

CANALS. At the end of 1915 it was authoritatively stated that one more season would finish the Champlain Canal of the New York State Barge Canal system, and also a channel from the Hudson River to Lake Ontario, via the Erie and Oswego branches. On each of these units there was a single unfinished and unawarded contract. The ratification at the November, 1915, election of the \$27,000,000 bond issue for the completion of the whole improvement made it possible to push the work on these remaining two contracts, together with that on the few others not quite completed, provided the Legislature took steps for the immediate issuing of the bonds. At the end of 1915 the Erie Canal west of the Oswego junction contained several uncompleted parts. Legal complications were largely responsible for the unfinished condition. On this section there were numerous railroad

crossings, causing delays both in coming to agreements with the railroads and in performing the work so as not to interrupt traffic. Taking into consideration the amount of work remaining and especially the number of crossings, Mr. Williams, the State engineer, expressed the opinion that two seasons would be required to complete the western half of the Barge Canal.

With the approach of completion of the canal proper much attention was being paid to the matter of terminals. A large number of contracts had been awarded for the various terminals, and on many of these work was in progress. About the city of New York the terminals selected were on the east side of the East River just north of the Queensboro Bridge, on the east side of the Harlem River just north of the Fourth Avenue Railroad Bridge, and at the foot of Camelia Street, Hallett's Cove in the East River, and on the south side of Flushing Bay in the Borough of Queens. A terminal was also in progress of construction at Gowanus Bay in Brooklyn, and plans were developed for one at Newtown Creek or Greenpoint. The canal authorities were also proceeding with the acquirements on Manhattan Island of piers in the East River, and a canal basin at 52nd Street and the North River. Throughout the State progress was being made on the various local terminals.

CAPE COD CANAL. Since the opening of traffic on the Cape Cod Canal, Aug. 1, 1914, to Dec. 31, 1915, there passed through the canal 9000 vessels. Up to Oct. 1, 1915, the canal was unavailable for vessels drawing more than 18 feet, but since that date the large heavy tows, most of which are used in the transportation of coal, steamers drawing 20 feet, and some 90 per cent of the schooners engaged in the coast coal and lumber trade were using the canal. A large number of government vessels, mainly gunboats, destroyers, and submarines, also passed through the canal during the year.

CANALS AT SAULT STE. MARIE. The season of 1915, for the United States canal, opened April 17th and closed December 20th, and that for the Canadian canal, opened on April 13th and closed December 16th. In this time 21,233 vessels of a registered net tonnage of 56,399,147 passed through both canals, 16,910 using the American canal, and 4323 using the Canadian, the registered tonnage being 47,918,847 for the American, and 8,480,300 for the Canadian. This was an increase of 2516 vessels, or 13 per cent over the total traffic for 1914, when 18,717 vessels passed through the canals, with a total tonnage of 41,986,339. The total freight in 1915 was 71,290,304 short tons, as compared with 55,369,934 in 1914. The most important item of cargo east-bound in 1915, as usual, was iron ore, of which 45,212,104 short tons passed through the canals, and 255,481,558 bushels of wheat.

During the year progress was made on the new work at the United States canal, Sault Ste. Marie, Mich., and at Lock No. 4 the excavation was completed, and work commenced by the contractors for the masonry. The new lock is parallel with and a duplicate of Lock No. 3. It is 1350 x 80 feet, with from 24½ to 25 feet of water on the sills. The filling culverts extend under the floor of the lock for its full length, and the emptying culverts extend from its lower end to discharge beyond the lower gates. These culverts were to have butterfly valves operated by hydraulic cylinders. The steel lock gates

of this canal are to be operated by electric winding engines.

LAKE WASHINGTON CANAL. During the year, Lake Washington Canal, at Seattle, Wash., was virtually completed. This canal extends from Puget Sound to Lake Washington, a lock being located about a mile inland from the main waters of the Sound. Salmon Bay, immediately above the lock, has a basin about a mile in length, and Lake Union begins about 2½ miles above the lock, the two being connected by a canal nearly 1½ miles long. The tidal range at this point is approximately 17 feet, and at Salmon Bay a basin or lock is formed about 16½ feet above mean tide, or only 8 feet above high tide, with its bottom from 24 feet to 32 feet below high tide. At this point there is a lock 80 x 825 feet, with one lift, so that Salmon Bay affords a non-tidal basin of approximately the same area as the Royal Victoria and Albert docks of London, on the shores of which various industrial establishments are to be located.

THE DALLES-CELILO CANAL, which opens the Columbia River to light draft vessels as far up stream as Priest Rapids on the main river above Pasco, and to Lewiston, on the Snake River (Idaho), was completed in the spring of 1915, and a formal opening was held May 3rd to 8th, a fleet of river boats passing down from Lewiston to Astoria, touching at intermediate points, and participating in the numerous celebrations which marked the dedication and formal opening. The canal is about 8½ miles in length, and overcomes a fall varying from about 82 feet at low water, to 45 feet at high water. The cost of the work was about \$5,000,000.

NEW ILLINOIS CANAL. The Illinois Legislature during 1915 passed the Illinois Waterway Bill providing for the expenditure of \$5,000,000 for the 65-mile, 8-foot waterway from Joliet to Utica. This canal will start at the end of the Sanitary District Canal and will follow the route of the old Illinois and Michigan Canal for a distance of 15 miles to Dresden Heights. At Dresden Heights an alternative plan is provided of following the Des Plaines River instead of the canal, in case litigation involving a privately owned dam site is decided in favor of the State. From Dresden Heights to Utica the Illinois River will be followed, except for a distance of 3 miles at Marseilles, where a new channel will be dug in order to get around the privately owned dam at that point. From Utica south to the Mississippi the Illinois River now is navigable. The proposed canal will in general follow the Illinois River and will have seven locks. Surveys were in progress during the year and it was estimated that two years would be required to complete the work.

OHIO RIVER IMPROVEMENTS. The Federal project for providing 9-foot slack water navigation for the Ohio River involves the construction of 53 locks and dams at a total cost of \$47,000,000. Up to 1915, 31 of these locks and dams had been completed or were under construction, and the construction of the remainder will be begun within two years. The extensive improvements to the Louisville and Portland Canal were nearing completion, so that the canal by the "Falls of the Ohio" would be in operation some time during the following year. The improvement consisted principally in widening the canal from 86½ feet to 200 feet, in building a new lock 600 feet in length and 110 feet in width, alongside

of the old locks, and in the renewal of the two existing swing bridges, one being replaced by a swing bridge 275 feet in length, and the other at 18th Street over the canal proper at Louisville by a Strauss direct lift bridge spanning the entire width of the canal. The new lock is of Standard Ohio River plan dimensions, 110 x 600 feet, and permits passage between the two pools which the river here forms. The difference in level varies from 27 feet, depending upon the height of water. The new lock has a lift at low water, above and below, of 27 feet; with the present dam up, a lift of 27 feet; and with the proposed new dam up, of 40 feet. It represents the most massive concrete construction, and possesses the practical advantage of permitting the coal barges to pass through in groups of three in line and four abreast.

NEW JERSEY SHIP CANAL. The ship-canal route across New Jersey, surveyed by the Federal government a few years previously, was to be permanently marked by the New Jersey Board of Commerce and Navigation. A survey party was engaged in placing monuments along the centre line. The canal is to extend from Bordentown, on the Delaware River, to Morgan, on Raritan Bay—about 33 miles, the route from Bordentown to Jamesburg having been previously surveyed. The State is to purchase the right of way for the canal, according to a resolution of the New Jersey Legislature in 1911. The type of canal recommended by a special board of United States army engineers, in its investigation of inland waterways, was a sea-level canal of 25 feet depth and 125 feet bottom width. The estimate of cost was \$45,000,000.

PITTSBURGH-LAKE ERIE CANAL. During 1915 Governor Brumbaugh of Pennsylvania appointed a new Lake Erie and Ohio River Canal Board to replace the old board which went out of existence in May after preparing a report on the prospects and design of a canal to connect the Pittsburgh district with Lake Erie. The new board was to complete the estimates of cost made by its predecessors. It was proposed that at the spring elections the issue of bonds to provide for the construction should be passed on by the people of the State, so that if the expenditure was authorized the canal board could start the actual construction of the canal in 1916-17. The waterway, it was asserted, could be built in five or six years, making allowances for legal holidays, though the actual work would consume only four years. The canal could be in operation in 1921 or 1922, and by that time the Ohio River would be deepened to Cairo, and, with the Erie Canal open in New York, Pittsburgh and Western Pennsylvania could reach 27 States and Canada by water transportation.

WELLAND CANAL. With the completion of the Panama Canal the most important waterway for ships under construction was the enlarged Welland Ship Canal in Canada upon which the Dominion government was expecting to spend some \$50,000,000. The canal so far as its length is concerned will not be notable, but its lock system will be unique in that it will have a higher lift than any ship canal so far constructed. The locks are to have a clear inside dimension of 80 x 800 feet, with 30 feet of water on the sills, while each of them will have the great lift of 46½ feet. At Thorold a flight will be constructed rivaling that at Gatun, for, though the locks themselves will not accommo-

date as big a vessel, the lift will be greater. There will be three locks in the flight, each with a lift 46½ feet, or a total lift of 139½ feet. This flight of locks will be double, one side for upbound and the other for downbound vessels. One of the unusual features of the construction will be the use of swinging single-leaf gates. The new harbor at the Lake Ontario entrance was well under way at the end of the year with the entrance piers and embankments, while much had been done toward widening and deepening the existing canal.

EUROPEAN CANALS. A canal between the Vistula and the Oder, large enough for 450 ton barges of 4 feet 8 inches draft, was opened for traffic in April, 1915. It is 182 miles in length and extends up the Warthe and the Netze rivers. The summit level for 16.8 miles is in an old and smaller canal whence the new waterway descends the Brahe to the Vistula. The total lift on the east side is 157½ feet and on the west side 92 feet.

It was proposed during 1915 that an investigation be made of a proposed waterway between Sweden and Norway, through the Strom water-course and the Kvarnsberg lakes. This would make possible the shipment of Swedish exports via a Norwegian Atlantic port, and at the same time it would facilitate the transport of products from West Norway to North Sweden. The important ore deposits which have recently been found on the Norwegian frontier, and not far from the Kvarnsberg lakes and also on the Swedish side, cannot be exploited unless improved means of transport are provided; and the proposed canal system would present an adequate solution.

One of the projects suggested by the great European war was the establishment of a waterway between the North Sea and the Indian Ocean via the Black Sea. A waterway for large vessels between the Rhine-Main on the one side and the Danube on the other for years had been urged as an industrial and commercial necessity not only for Bavaria but for the whole of Germany, which has devoted much attention to its internal waterways. The canalization of the Main as far as Aschaffenburg had been undertaken, and the extension of this canalization as far as Hamburg was under contemplation before the war, but no time had been determined upon for taking up the work. The Bavarian Canal Union, on October 25th, laid the matter before the Chancellor, asking that special interest might be devoted to the completion of the Main-Danube waterway. The proposed canal was important both as a commercial and a military measure, as it would provide an outlet for German manufactures that could not be stopped by the British navy.

CANARY ISLANDS. A group of islands off the northwest coast of Africa, constituting a province of Spain. Area, 7273 square kilometers (2808 square miles). The census of Dec. 31, 1910, returned a population of 444,016; estimate of Dec. 31, 1913, 469,768. The capital, Santa Cruz de Tenerife, had 63,004 inhabitants in 1910; Las Palmas, the most important town, had 60,338. Potatoes, bananas, onions, tomatoes, and nuts are exported.

CANCER. Some remarkable studies on the heredity of mouse cancer were published by Maud Slye in 1914 and 1915. The work of this investigator seems to show that cancer is trans-

missible from generation to generation, strictly in line with the laws of heredity, and it can be bred in and out of mice at will. The stock of ten thousand mice, representing ten generations, now under observation, shows almost constant development of spontaneous cancer. The immense amount of evidence accumulated warrants the belief that the tendency to develop cancer is transmissible. The lesson drawn by Miss Slye is that, since cancer is not transmitted itself, but is likely to arise (probably as a result of local irritation) in individuals with a marked heredity tendency, such individuals should be careful to avoid overirritation of tissue in which cancer is likely to develop. The eugenic control of marriages in which a pronounced cancer history is present on both sides, would do much to decrease the frequency of this scourge. The drug treatment of cancer—chemotherapy—has not realized the hopes which the work of Ehrlich, Wassermann, and others seemed at first to justify. It is a rare year which does not witness the exploitation of at least one cancer cure. The treatment which attracted most attention during 1915, and which was exploited in the newspapers, is known as the Horowitz-Beebe treatment. The specific is called autolysin and originated with an Austrian biologist and chemist named Horowitz. Although the exact composition of the serum was not disclosed, it was said to be a mixture of the following plants: *menyanthes trifoliata* (commonly known as buckbean); *melilotus officinalis* (the common yellow sweet clover); *mentha crispa* (a European variety of mint); *brassica alba* (white mustard); *anemone* (a common spring flower sometimes called liver leaf); *viola tricolor* (pansy); *anthemis* (Roman camomile); *fructus colocynthidis* (colocynth); *lignum quassia* (quassia); *urtica dioica* (nettle); rhubarb root; and hedge hyssop. The medicine was used both as a poultice and an injection. The "cure" was short lived. See also AUTOLYSYN.

The Public Health *Bulletin* of the Massachusetts Department of Health says that statistics give a higher mortality from cancer for New England than for any other group of States, and each separate State has a higher mortality than the general rate of 78.9 per hundred thousand in the entire registration area of the United States. In Maine the mortality is 107.5; New Hampshire, 104.4; Vermont, 111.7; Massachusetts, 101.4; Rhode Island, 93.3; and Connecticut, 85.1 per 100,000. The census of 1913 is the basis for these figures, and they show that 6817 persons died of cancer in New England during that year. English statistics for the same year indicate that cancer is increasing in Great Britain. The death rate among males was 947 per million, among females 1155 per million. The conspicuous facts in the registrar-general's report are first, the constantly increasing mortality in the European population, particularly among males; second, that the excessive female mortality is greater among individuals from 25 to 55.

In the United States Beitler has made a study of the cancer mortality in the registration area during the decade from 1904 to 1913, and finds that the number has increased from 23,295 in 1904 to 49,928 in 1913, an increase in the rate from 70 to 79 per 100,000. This increase applies not only to the number of deaths, but to the death rate, which is 12.5 per cent less

in the first than in the last decade. Beitler believes that cancer mortality is increasing in the United States and that the question of more refined diagnosis and changes in the composition of the population are negligible factors.

CANFIELD, DOROTHY. See LITERATURE, ENGLISH AND AMERICAN, *Fiction*.

CAPE COD CANAL. See CANALS.

CAPE COLONY. See CAPE OF GOOD HOPE PROVINCE.

CAPE OF GOOD HOPE PROVINCE. One of the four original provinces of the Union of South Africa. Population according to the census of 1904, 2,409,804, of whom 579,741 were whites; census of 1911, 2,564,965, of whom 582,377 were whites. In 1911 Capetown, the capital, had, with suburbs, 161,579 (85,442 whites); Capetown municipality had 67,159 (29,863 whites). Kimberley and Beaconsfield, 44,433 (17,507 whites); Kimberley municipality, 29,525 (13,598); Beaconsfield municipality, 14,294 (3404); Kenilworth, 614. Port Elizabeth, 30,688; with suburbs, 37,063 (20,007 whites). East London, 20,867; with suburbs, 24,606 (14,899 whites). Grahamstown, 13,830; Paarl, 11,018; Simonstown, 4751; Vryburg, 2461; Mafeking, 2296. Of the total population, Europeans form about one-quarter and the colored races three-quarters; one-fifth of the population is urban. Christians numbered 1,437,688, most of whom were Protestants; Roman Catholics, 35,934; Mohammedans, 24,189; Jews, 16,744. Returned as of no religion were 1,077,998, of whom 1,047,233 were natives. Of the total population, 1,735,491 (859,716 males) were unable to read or write. For area, population, production, and trade, see SOUTH AFRICA, UNION OF.

CAPE VERDE ISLANDS. A group of Portuguese West African islands, having a total area of 1516 square miles. Population (1912), 143,929. Imports and exports (1913), 1,860,240 and 306,684 escudos respectively. The budget for 1913-14 balanced at 474,135 escudos. Capital, Praia.

CARBIDE. See CHEMISTRY, INDUSTRIAL.

CARDEN, SIR LIONEL EDWARD GRESLEY. British diplomat, died Oct. 15, 1915. He was born in 1851, and educated at Eton College. In 1877 he was appointed vice-consul at Havana, and from 1885-89 was British Commissioner on the Mexican Mixed Claims Commission, subsequently filling consular and diplomatic posts in Mexico, Cuba, and Central America. He was British minister to Mexico from 1905-13. In the spring of 1914 he was appointed minister to Brazil, but instead of proceeding to that country, at the request of Sir Edward Grey he returned to Mexico where a struggle for rival candidates for presidency had reduced the country to a state of anarchy. He was convinced that the best chance for a stable government and for the safe interests of the Mexican people, lay in the success of General Huerta. This conviction emphatically expressed created friction between him and the United States government, and he was eventually recalled to London. On his arrival, he was informed that his appointment to Brazil had been revoked.

CARINTHIA. See AUSTRIA-HUNGARY.

CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING. See UNIVERSITIES AND COLLEGES.

CARNEGIE GEOPHYSICAL LABORATORY. See GEOLOGY; and MINERALOGY.

CARNEGIE INSTITUTE OF TECHNOLOGY. An institution for technical education founded by Andrew Carnegie at Pittsburgh, in 1909. The total enrollment in all departments in the autumn of 1915 was 3432. The faculty numbered 211. The institution includes four separate schools, each with its own faculty, buildings, and student body. These are the School of Applied Science, the School of Applied Design, the School of Applied Industries, and the Margaret Morrison School for Women. There were no noteworthy changes in the membership of the faculty during the year. An additional \$1,000,000 for the Endowment Fund was received from Andrew Carnegie. The total endowment at the end of the fiscal year 1915 amounted to about \$9,000,000, and the income from 1914-15 to \$603,320. There were 350,000 volumes in the adjacent Carnegie Library.

CARNEGIE INSTITUTION OF WASHINGTON. The annual official report for 1915 differs from preceding reports on account of the European war. Instead of summaries of the important work done in the several departments of the institution, it deals mainly with the salient events of the year, the characteristics of the institution, its financial records, and its publications.

With the progress of the war it became increasingly clear that there must be a suspension of the institution's activities in the belligerent countries. Therefore all research associates of American citizenship were withdrawn from war zones. The result was many changes in plans, especially in the departments of historical research and terrestrial magnetism, and delay in research work because of exclusion of the workers from necessary sources of information. Except for this, however, the direct effects of the war upon the activities of the institution have not been serious. The unparalleled destruction of life and property now going on in Europe will probably have closely related though quite different results in neutral countries; and it is not inconceivable that sound methods of research may undergo a temporary eclipse as a consequence of the pending struggle.

The institute's participation in the Panama-Pacific International Exposition called for a very restricted choice of illustrations of methods and results of research, in order to make a successful appeal to a wide range of popular interests. Photographs, models, pamphlets explaining the plan and development of the institution, and a classified list of its publications, were freely distributed. The aim was to get an objective popular estimate of the institution's functions in contemporary society. The results showed (1) that inappropriate ancestral prepossessions still clouded popular views of scientific research, and (2) that there was a tendency, noticeable even in the public press, to exaggerate and to attribute to occultism the most manifest products of forethought, diligence, and the application of well-known principles. Nevertheless it was evident that the scientific method is gaining wider recognition even among unreflective minds, and this is seen in nearly every field of current activity. New research institutions have sprung up in the last few years, and these have been benefited by the influence of, and by their relation with, the Carnegie Institution. More rational notions of the meaning and objects of research, and especially of its cost

and the economies to be gained by it, are being disseminated. Along with the rise of new research organizations the scientific method is rapidly gaining control in the management of commercial and industrial enterprises. The necessity of science in successful business is thus aiding in the diffusion of sound learning among the masses. The so-called laborer now has to know more than he knew before; many manufacturing plants now provide instruction for operatives; and, what is more important, there is a general recognition of research as an essential preliminary to progress.

With regard to the costs of research, the Carnegie Institution has found it necessary to endeavor to correct popular misapprehensions. With this in view it lays down the following elementary truths, which have been generally ignored: (1) Sound research is expensive in proportion to its comprehensiveness and thoroughness; (2) the objects of research are now too great in number to be adequately financed; (3) each research organization must therefore choose its field and restrict itself to it. In this connection the relatively narrow limitations of the Carnegie Institution may be illustrated by the fact that the United States government spends, for work which may be properly called research, twenty times the income of the institution. Municipalities and industrial organizations are likewise active. No endowed institution can be reasonably expected to supplant governmental functions or to supplement governmental resources in research, and our understanding of this truth is necessary to correct fallacious popular beliefs that the Carnegie Institution should undertake enterprises for which it cannot be financially responsible. Its activities are strictly limited by its income, more especially since the purchasing capacity of monetary standards, which has fallen by more than 30 per cent during the last two decades, is apparently still diminishing.

The report for 1915 contains the first official statement yet made as to the theories of procedure in the institution and of the objects to be attained. This has been possible only after a decade of patient observation. While it is easier to say what the institution is not rather than what it is, nevertheless it may be positively defined as an establishment for the conduct and promotion of original research, whose results are freely given to the world without restrictions of letters-patent and without privileges derived from copyrights. In answer to innumerable inquiries as to what it can undertake, or as to the scope of its activity, the attitude of the institution may be said to be liberal in its recognition of all branches of demonstrable knowledge and critical in respect to all unverified and unverifiable representations. While no attempt has been made to limit recognition to mathematico-physical science, it needs to be said that complete equality in application of the institution's income has not been attained and is unattainable.

Its departments of research are the most striking characteristic of the institution, and absorb the bulk of its income. For their work long periods of time are required and the true value of the results cannot be estimated adequately in terms of an interval shorter than a decade. With respect to these departmental aims, needs, and attainable ideals the report

for 1915 omits the brief summaries hitherto annually given and is restricted to general observations. In doing so it protests against any narrow interpretation of the word "practical," affirms that, in general, results justify the cost, and that, as regards completion of the work of any department, it is unwise to expect from sudden discoveries results at all comparable to those obtained from steady increments of knowledge. These remarks hold true not only concerning the work of the departments, but of the activities of research associates.

A noteworthy feature of the institution is the Division of Publications established in 1909. The problem of book distribution is solved by sale at nominal prices, to cover the cost of book-making and transportation to purchasers.

In the fiscal year ending Oct. 31, 1915, the total appropriations amounted to \$1,274,017; the total receipts for the year were \$1,215,046. The total of appropriations in 1912-15 was \$11,228,577; the total receipts, \$11,656,532. During the year the following amounts were allotted: Botanical research, \$40,615; experimental evolution, \$48,919; geophysical laboratory, \$89,164; historical research, \$31,400; Marine biology, \$19,150; meridian astrometry, \$26,380; solar observatory, \$220,130; terrestrial magnetism, \$141,310; embryology, \$32,180; nutrition laboratory, \$45,064; Division of Publications, \$10,000.

The annual meeting of the Board of Trustees was held in December. Two distinguished research associates died during the year: Alfred Thayer Mahan, Rear Admiral, United States navy (retired); and Charles Sedgwick Minot, professor of comparative anatomy in the medical school of Harvard University. The president of the institution is Robert S. Woodward.

CAROLINE ISLANDS. Formerly a German possession lying north of New Guinea and forming a dependency of German New Guinea (q.v.). Area (Caroline, Palau, and Mariana or Ladrone Islands, excepting Guam), 307 square miles; population, about 55,000; white population (1913), 264 (of whom 154 Germans). Capitals, Pohnaé and Yap. The principal export is copra. British troops took it in 1914.

CARR, LUCIEN. American archaeologist and art curator, died Jan. 27, 1915. He was born in Lincoln County, Mo., in 1829; graduated from St. Louis University in 1846; and from 1877 to 1894 was assistant curator at the Peabody Museum of American Archaeology and Ethnology. He wrote several books on archaeology, including: *The Mounds of the Mississippi Valley*; *Prehistoric Remains of Kentucky* (with Prof. N. S. Shaler); and *Missouri* (a brief history).

CATHOLIC UNIVERSITY OF AMERICA.

A Roman Catholic institution for higher education, founded at Washington, D. C., in 1887. The total enrollment in all departments in the autumn of 1915 was 680. The faculty numbered

85. The Very Rev. John A. Ryan, D.D., and Rev. John O'Grady were made members of the faculty during the year. No noteworthy benefactions were received in 1915. The productive funds of the university at the end of the fiscal year amounted to \$3,736,144. The library contains about 80,000 volumes.

CEMENT. The most notable feature of the cement industry in 1914 was the fact that the first recorded decrease in the annual production of Portland cement took place in that year. This was due to the large increase in production and stock in 1913, which resulted in a necessary curtailment of the output in 1914. Natural cement showed an increase, but it was not sufficient to carry the total for all hydraulic cements beyond the record production of 1913. The price of Portland cement decreased 7.8 per cent a barrel in 1914. The total quantity of Portland, natural, and puzzolan cement marketed or shipped from the mills in 1914 was 87,257,552 barrels, valued at \$80,533,203, compared with 89,541,348 barrels valued at \$89,550,527 in 1913. The quantity of Portland cement marketed in 1914 was 86,437,956 barrels, valued at \$80,118,275. The total quantity of Portland cement produced in 1914 was 88,230,170 barrels, valued at \$81,789,368. Pennsylvania is the most important producer of Portland cement, with Indiana second, and New York third. In 1913 the output of California exceeded that of New York and Illinois, but in 1914 this State dropped from third to fifth place. Other States producing large quantities are Missouri, Michigan, Iowa, New Jersey, Kansas, Texas, and Washington. The exports of cement from the United States in 1914 amounted to 2,552,656 barrels, valued at \$3,760,920. The imports of foreign cement amounted to 120,196 barrels.

The production of natural cement in the United States in 1914 was 751,285 barrels, valued at \$351,370, compared with the output of 744,685 barrels, valued at \$345,880 in 1914. The chief producers of natural cement are New York, Pennsylvania, Illinois, Indiana, Ohio, Georgia, Minnesota, and Kansas. The output of puzzolan cement in 1914 was 68,311 barrels, valued at \$63,358. Practically the entire quantity was produced in Alabama, Ohio, and Pennsylvania.

See *CHEMISTRY, INDUSTRIAL, Cement from Beets*.

CENTRAL AMERICA. See *Central American countries*; and *PEABODY MUSEUM*.

CEPHAELINE. An alkaloid obtained from the ipecacuanha plant. Its chemical formula is $C_{14}H_{20}O_4N$, and it occurs in snow-white needles, which readily turn yellow. Its action and uses are the same as those of the plant from which it is derived, but it is more emetic than ipecac and causes more irritation of the kidneys; on the other hand it is less nauseant and less depressing to the heart.

CEYLON. An island in the Indian Ocean, south of India; a British crown colony. The

capital is Colombo. Area, 25,332 square miles; population, according to the census of March 10, 1911, 4,110,367. There were 8524 Europeans, 26,673 Burghers and Eurasians, 2,715,686 Singhalese, 1,060,167 Tamils, 267,054 Moors, 12,992 Malays, 19,271 various. More than half the people (2,474,393) are Buddhists; Hindus, 939,701; Christians, 410,525; Mohammedans, 284,482; various, 1266. The city of Colombo had 213,396 inhabitants; Negombo, 13,152; Moratuwa, 27,253; Kalutara, 13,006; Kandy, 30,148; Jaffna, 40,539; Galle, 40,187; Matara, 13,851; Batticaloa, 10,715; Trincomalee, 9086.

Plantation laborers number about 510,000 (in large part Indian coolies). Acreage under coconuts, 942,621; rice, 680,574; other grains, 101,708; tea, 580,845; rubber, 215,000; cinnamon, 47,292; cacao, 43,358; tobacco, 16,241; coffee, 1512; cinchona, 263. There are 1986 gem quarries, and pearl banks leased to an English company; the plumbago mines and pits (381) yielded (1913) about 570,807 cwts., valued (estimate) at Rs. 9,047,290.

Commercial and financial statistics appear below, in rupees (total trade and trade with the United Kingdom; total shipping and British shipping):

	1910	1912	1913
Imports	164,864,708	181,999,991	199,640,797
Imports, U. K. . . .	42,874,524	50,999,044	58,199,628
Exports	178,717,722	198,954,902	234,863,554
Exports, U. K. . . .	80,063,196	97,756,191	105,612,748

* Tonnage entered and cleared.

A large part of the trade is with British colonies. Public debt, Dec. 31, 1913, Rs. 91,505,020. The railways are all owned and operated by the government; total mileage, 604½. The line from Madawachchi to Talai Manaar (about 65½ miles) at the northwestern end of Manaar Island, will be connected with the Indian railways by steamers landing at Dhanuskodi, the terminus of the Indian line. Governor (1915), Sir Robert Chalmers.

Tributary to the Ceylon government is the Maldivé Archipelago (a group of 17 islands, with a population estimated at 72,237); the Laccadive Islands belong to British India.

A serious rebellion in Ceylon was reported in September by German dispatches. The entire island was asserted to have been in revolt since June; rioting and sanguinary street-fighting had occurred at Colombo; thousands of persons had been killed and other thousands arrested. The English press was inclined to regard the disturbances in Ceylon as unimportant local outbreaks, devoid of political significance.

CHAMPLIN, JOHN DENISON. American author, and editor of reference books, died Jan. 8, 1915. He was born in Stonington, Conn., in 1834; graduated from Yale in 1856; studied law; and in 1859 was admitted to the bar. He practiced but a short time, however, becoming a newspaper editor. From 1869 until his death, practically all his time was devoted to writing and compiling. He was the author or editor of: *Young Folks' Cyclopædia of Common Things* (1879); *Young Folks' Cyclopædia of Persons and Places* (1880); *Young Folks' Cyclopædia of Natural History* (1905); *Cyclopædia of Painters*

and *Paintings* (1886-88); *Cyclopædia of Music and Musicians* (1888-90); *The Tragedy of Anne Hutchinson* (1911); and *One Hundred Families of the Seventeenth Century in England and New England* (1912). He was one of the editors of the *American Cyclopædia* and the *Standard Dictionary*; contributed, also, to the *Encyclopædia Britannica* and the *Memorial History of New York*; and wrote many articles for magazines and newspapers.

CHANDLER, JOHN GORHAM. American soldier, died June 21, 1915. He was born in 1830 at Lexington, Mass., and graduated from the United States Military Academy in 1853. At the outbreak of the Civil War he was captain and assistant quartermaster. He served throughout the war, and in 1867 was appointed major and quartermaster. After advancing to the rank of brigadier-general in 1904 he was retired. He received two brevets for gallant service during the Civil War.

CHARCOAL, ANIMAL. See CHEMISTRY, INDUSTRIAL, *Bone Black and Charcoal*.

CHARITIES. As in the immediately preceding years, so in 1915, there was a continued expansion of the scope, purpose, and financial resources of charitable and philanthropic undertakings in the United States, if not throughout the world. There were no large new foundations, but there were numerous benefactions (see GIFTS), and the total expenditures in all lines of charity and philanthropy were not less than a half billion dollars. The work undertaken by the Rockefeller Foundation (q.v.), the American Red Cross, and numerous other societies in 1914 for the relief of Belgium was continued and new undertakings for the relief of Poland, of Serbia, and of the Jewish population of devastated areas were begun on a large scale. (See RED CROSS, and RELIEF FOR WAR VICTIMS.) At the opening of the year American cities were struggling with a very acute problem of relief for unemployment; the development of business made this particular problem less difficult in the winter of 1915-16. (See UNEMPLOYMENT.) Matter of interest in connection with this topic will be found under the following articles: CHILD LABOR; JUVENILE COURTS; LABOR; MINIMUM WAGE; OCCUPATIONAL DISEASES; OLD-AGE PENSIONS; PENSIONS FOR MOTHERS; PENOLOGY; PROSTITUTION; WOMEN IN INDUSTRY; and WORKMEN'S COMPENSATION. These articles are of interest primarily through the fact that they show various organized movements for the prevention of destitution which is everywhere recognized now as immensely more rational than temporary relief, however necessary the latter may still be. Scientific inquiry into the causes of dependency and delinquency is necessarily followed by an extension of public supervision, the control of haphazard charitable activities, and constructive modifications of the industrial and social system so as to secure greater justice and self-sufficiency.

NATIONAL CONFERENCE OF CHARITIES AND CORRECTION. The 42nd annual meeting of this conference was held in Baltimore in May. With 2400 registered delegates, it was the largest meeting in the history of the conference. Indianapolis was chosen as the place for the 1916 meeting. Rev. Father Francis H. Gaviak of Indianapolis was elected president, and W. T. Cross was reelected secretary. The conference

changed its organization by reducing the number of ex-presidents on its executive committee from 22 to 3. This was believed to make the organization more democratic in that the control of the organization was placed in the hands of the members. There was presented a rounded community programme in children's work, which dealt with public, private, indoor, and outdoor work to secure fair treatment, health, and education for children. The family was discussed by Dr. Crothers and Prof. James H. Tufts of the University of Chicago. Dr. Tufts, analyzing and reviewing the old and the new in his paper on the "Ethical Basis of the Family," came to the conclusion that the family will remain about as it is without shifting toward free love and freer divorce than we have now. It will be wiser, he believed, to promote right marriages than to inveigh against divorce, and within a generation society will find some better method of dealing with illegitimacy than to inflict punishment upon the children for the sins of their fathers. He thought that, if we could improve morals, we should change social conditions by raising the standard of living, providing fairer wages and more recreation. Abraham Flexner argued against including social work among the professions, saying the professions have specific ends, while social work seemed to him not so much a definite field as an aspect of work in many fields, as medicine, law, education, and architecture. The need, he thought, is for well-informed, well-balanced, resourceful people rather than for any definite kinds of technical skill. Porter R. Lee took the opposite view, maintaining that case-workers and social investigators, who make up social workers, have developed technical skill to a point which may be considered professional. The one group is of social diagnosticians, while the other is of social investigators who provide the information on which sweeping changes through social legislation are based. Miss Vaile, supervisor of outdoor relief in Denver, gave a paper on public outdoor relief, emphasizing the success of turning such a public office into a charity organization, and the need for removing the old time relief official. Mr. Jeffrey R. Brackett of Boston pointed out that growth of the widows' pension movement tremendously increasing the cost of outdoor relief work makes it more necessary than ever that public funds be safeguarded from abuse. The public must take an intelligent interest in the care of the poor, for the protection of the public as well as for the protection of the poor, and it must gradually secure a better administration of relief, just such as it has of schools and fire departments. The relation of public to private charity was also discussed. A community plan in children's work was described by its author, C. C. Carstens, of the Massachusetts Society for the Prevention of Cruelty to Children.

The following committees for 1916 and their chairmen were named: Children, Julia C. Lathrop, Washington; corrections, Katharine B. Davis, New York; public and private charities, H. H. Shirer, Columbus; family and community, Ada E. Sheffield, Cambridge; feeble-mindedness, E. R. Johnstone, Vineland, N. J.; promotion of social programmes, Edward T. Devine, New York; health, Prof. Irving Fisher, New Haven; inebriety, Bailey B. Burritt, New York; and unemployment, Prof. Charles E. Merriam, Chicago.

OTHER BALTIMORE MEETINGS. In conjunction with the foregoing met The American Association of Officials of Charity and Correction. The programmes dealt with treatment of the insane and mentally defective; home relief; correctional programmes and administration of institutions. The annual conference of the National Probation Association considered the securing of effective adult probation laws in the many States now having none; extension of probation work in rural communities; development and application of standards in juvenile court work. The American Association of Societies for Organizing Charity gave special attention to a constructive programme on the basis of the case-work method. In the discussion on "Maintaining Standards in Times of Stress" it was revealed that progress had been made since the hard times of 1907 in the intelligent handling of depressions and that greater confidence on the part of the public was manifested. It was stated that correspondence had been conducted with 289 towns and cities on all conceivable points regarding organization and the adaptations of policy to new situations. Other Baltimore conferences included: the National Federation of Settlements; National Conference on the Education of Dependent, Backward, Truant and Delinquent Children; National Federation of Remedial Loan Associations (see LOAN SHARKS); National Probation Association; and National Association of Jewish Social Workers.

STATE CONFERENCES. The nation-wide interest in organized and scientific charitable activities is reflected in the numerous State conferences held annually in all parts of the Union. Only a few of these may be referred to here. The 7th California Conference of Charities and Corrections met in February. Unemployment and the municipalizing of charity work were the foremost topics. The name of the conference was changed to California Conference of Social Agencies. The 12th State Conference of Charities and Corrections of Virginia met in February. The unique feature was the share taken by the colored delegates, whites and negroes being present in about equal numbers. The 14th annual meeting of the New Jersey State Conference of Charities and Corrections was held in April. The growing conviction of the responsibilities of the State and municipalities rather than private organizations for philanthropic undertakings was made clear. Points emphasized were: the tendency toward a broadening of public relief; agents should be trained social workers; the close connection of education with social problems; and prevention is fundamentally more important than cure. "The outstanding features of the 6th New York City Conference of Charities and Correction were the discussions of health programmes, medical social service, and the relations of occupations and diseases; the radical change created by recent legislation in placing the New York City Department of Correction upon a semi-reformatory basis through the introduction of the indeterminate sentence and parole system for the penitentiary and the workhouse as well as for the New York City Reformatory for Misdemeanants; the discussion of a city plan for Greater New York; and unemployment as a social problem."* A resolution to form a State board of charities and corrections was an out-

* *The Survey*, June 12, 1915, p. 258.

come of the 3rd Alabama Sociological Congress held in May. Problems of legislation, of community health, and of improvements needed in rural conditions were also discussed.

"At its meeting in October, the Pennsylvania Conference of Charities and Correction was rechristened the Pennsylvania Conference on Social Welfare. The limited time of a two-day conference was so divided that half a dozen important subjects were treated in general meetings: prisons, infant mortality, mothers' assistance or pensions, juvenile courts and probation, public health, and charity organization work in small cities and in rural communities."* At luncheons were considered a large number of other topics, including: work for neglected and dependent children, public health nursing, community organization for social work, reformatory work for girls in small cities, federation for financial purposes, girls' clubs, hospital social service, social hygiene, social research, and special work for boys. The 41st annual convention of the Pennsylvania Association of Directors of the Poor and Charities and Correction was held in October. "The topics discussed included methods and principles of giving outdoor relief, qualifications and selection of employees for county institutions, prevention of feeble-mindedness, care of dependent children, the functions and administration of the almshouse, and the relations of county and State in the care of various classes of insane. The question of bringing about a union with the Pennsylvania Conference on Social Welfare was discussed, but no definite action was taken."* A resolution was presented to the Legislature by the Public Charities Association of Pennsylvania requiring the State board to devise and present to the next Legislature a plan whereby the State can assume full care and control of all dependent insane. The methods of financing and administering Pennsylvania charitable institutions have long been unsatisfactory to many students of such matters. The State is giving money to 300 institutions, most of them local in scope, private in management, sectarian and denominational in control. This fosters the development of unnecessary agencies, many of them inefficient, and has thrown the philanthropies into the game of unscrupulous partisan politics.

At the Massachusetts State Conference of Charities held in October fundamental plans rather than emergency relief methods for handling unemployment were discussed. Neighborhood recreation, mothers' aid, correctional institutions, and feeble-mindedness were also considered. The Illinois Conference of Charities and Correction celebrated its 20th anniversary at a meeting in October. Papers were read on "A Plea for the Under-average Child in the Public School," and "The Limit of Social Service Work by a Municipality." Mental and physical efficiency was discussed from the standpoints of public schools, the health commissioner, sociology, and business efficiency. Medico-social service, rural social service, the family and children, probation, and prevention of crime were considered.

CONFERENCES ON BLINDNESS AND TUBERCULOSIS. The first meeting of the National Committee for the Prevention of Blindness was held in New York in November. With an enlarged staff and an extended field it continues the work carried on for six years by the New York

Committee for the Prevention of Blindness. Illustrated lectures prepared in simple language for foreigners were suggested as an educational method. Compulsory notification of blindness at birth was emphasized as the most effective method yet at hand for reducing preventable blindness. Ophthalmia neonatorum, trachoma, toxic blindness, infectious and constitutional diseases, occupational disease and accidents were discussed as causes of blindness. It was urged that this committee remedy those conditions which spoil eye efficiency, such as poor illumination in schools, factories, stores, and elsewhere.

The National Anti-Tuberculosis Association met in four sectional conferences during October and November in different parts of the country. The Mississippi Valley Conference met at Indianapolis, the Southern at Columbia, S. C., the New England at Springfield, and the North Atlantic at Albany, jointly with the New York State Conference. The points especially emphasized at these four conferences were: standardization of methods; educational, nursing, dispensary, and institutional measures; the enlistment of the general medical practitioner in the movement; early diagnosis; tuberculosis as an industrial problem; the tuberculous negro with his racial and hereditary factors as well as environmental, housing, and work conditions; problems of childhood; open-air schools. Each conference appointed a continuation committee to arrange meetings and serve as a centre for appeals for legislative and general community support.

JEWISH CHARITIES. The National Association of Jewish Social Workers met at Baltimore in May. Consideration was given to general problems as well as to those peculiar to the charitable work among Hebrews on account of their dietary laws and special customs. The problem of tuberculosis and especially of transportation of afflicted persons was discussed. In connection with family desertion the activities of the National Desertion Bureau which had been previously organized were analyzed. The establishment of a school for Jewish social workers with courses in Jewish history, language, and literature was considered; favor was expressed for a national field secretary to organize Jewish communities, and \$1500 was pledged to this end. Other subjects considered were the naturalization of Jewish immigrants, the problems of the Jewish settlement, and especially its relation to other relief agencies.

In New York City the Jewish Community established a placement clearing house at 360 Second Avenue. Six departments were established to analyze the problems peculiar to Jewish people in industry, in philanthropy, in religious affairs, in education, in social work, and in social morals. The Free Synagogue undertook an interesting experiment in the relief of unemployment (see UNEMPLOYMENT). The Jewish Aid Society of Chicago similarly entered upon the plan of establishing men in business who had become dependent through sickness or insufficient earnings. Plans for the Federation of Jewish Charities and Philanthropies in New York City made substantial progress.

CHAUTAUQUA INSTITUTION. During 1915 the attendance was not equal to that of 1914, and this was attributed to the war. Nevertheless, the attendance was second to that of the record year, and the home reading course showed an increase of 5 per cent over 1914, owing to the fact that this was the year of American topics in that course. At the summer assembly and school in 1915 there were about 3500 students in 200 different classes, and with a teaching faculty of 85. The programme was for eight weeks. Since *The Chautauquan* was merged in *The Independent*, the latter periodical, which now supplies for Chautauqua readers a current events element, has been the official organ of the home reading circle. The Chautauqua Institution in 1915 started a monthly bulletin of helps and hints called *The Round Table*, which is sent to each of its members. The New York office is at 119 West 40th Street.

CHEMICAL INDUSTRIES, NATIONAL EXPOSITION OF. See **CHEMISTRY, INDUSTRIAL**, section so entitled.

CHEMICAL INDUSTRY. See **CHEMISTRY, INDUSTRIAL.**

CHEMICAL SOCIETIES. See **CHEMISTRY, INDUSTRIAL.**

CHEMISTRY, GENERAL PROGRESS OF. It has been said that "Science moves but slowly, creeping on from point to point." This is not always true. The history of science presents its course rather as an irregular succession of rapid advances and slow ploddings. The discovery of a single phenomenon may suddenly open to view long vistas, the careful exploration of which will require many and laborious years. The phenomena of radio-activity, the characteristics of electrical discharges in vacuo, the X-ray spectra of metals and their reflection from crystal surfaces, the more careful study of spectrum lines and the influence of magnetic and electrical fields upon them, the very recent investigations on the behavior of substances at temperatures near the absolute zero or at pressures compared with which that at the bottom of the sea is insignificant, have furnished unexpected insight into the constitution of matter and placed theoretical chemistry upon an eminent vantage ground. The advances in 1915 have not fallen short of expectation. In a fragmentary account like the present only a few of the more salient investigations can be discussed.

Particularly persistent have been the researches on the so-called isotopic elements; that is, elements of identical chemical properties, which occupy the same space in the periodic table, but which have different atomic weights. The possibility of the existence of such elements was indicated by Mosley's work on the X-ray spectra, and in a radio-active disintegration series some of the elements have been shown to be isotopic. According to theory, isotopic elements are those which have the same positive charge on the nucleus of the atom, and it is this electrical charge, not the mass of the atom, that determines the chemical character of the element. During the past year a large number of determinations of atomic weight of the lead

contained in different radio-active minerals have been carried out. For lead from the mineral thorite Soddy and Hyman found the atomic weight 208.4. Honigschmidt and Morawitz found for lead from a crystallized specimen of uranite from Morogoro in German East Africa, the value 206.04. Others, working with lead from other radio-active sources, have found values between these two extremes. According to the latest determinations by Baxter and Thorvaldsen, the atomic weight of ordinary lead is 207.19. If we take into consideration that the end product of the radio-active disintegration of uranium is calculated to have an atomic weight of 206.0, and the end product of thorium an atomic weight of 208.4, we are led to the belief that ordinary lead is a mixture of at least two isotopic elements,—the end disintegration products of these two series.

How many of our chemical elements are mixtures of isotopes, we cannot say. Two forms of neon, with identical spectra, but having respectively the atomic weights 20 and 22, have been discovered by Aston working with J. J. Thomson.

In addition to lead, atomic weight determinations of the year 1915 include carbon, sulphur, iodine, copper, nickel, cadmium, mercury, tin, tantalum, praseodymium, ytterbium, and uranium. With respect to a sentiment favoring conservatism in the adoption of new atomic weights, no changes have appeared (until 1915) in the annual lists of the international committee on atomic weights since 1912. This year the following changes seemed warranted and have been made:

	Previously Accepted At. Wt.	At. Wt. According to International List of 1913
C	12.00	12.005
S	32.07	32.06
He	3.99	4.00
Su	119.0	118.7
Pb	207.10	207.20
Ra	226.4	226.0
U	238.5	238.2
Yt	89.0	88.7
Pr	140.6	140.9
Yb	172.0	173.5
Lu	174.0	175.0

In the field of high pressures Bridgman has continued his determination of melting point curves up to the very extreme pressures which he has been able to obtain, and has fixed the transition point curves of solids which exist in different forms over a range of 200 degrees Centigrade and up to 12,000 atmospheres (about 180,000 pounds per square inch). His work at these pressures, carried out by means of a chrom-vanadium steel bomb with a compressing piston fitted with a novel and practically un-leakable packing device, has broken a new trail into a far and fascinating field. All of the considerable number of melting point curves traced by him show a continuous rise or a continuous fall in melting temperature with the pressure. Judging from the results of his latest paper, the same rule usually holds for transformations of solid forms into other solid forms. But that this is not an absolutely general rule, is shown by the curve which gives the temperature of transformation of the red into the yellow form of mercuric iodide at different pressures. The temperature of transition at atmospheric pressure is 127°C; with increase in

pressure the transition temperature increases; at 5000 atmospheres it reaches a maximum of 181.2°C. Further increase in pressure causes a fall in the transition temperature, and at 10,000 atmospheres the equilibrium temperature is only 79.4°C. According to thermodynamics, at the maximum of the melting point or transition curve the specific gravity of the two forms should be the same, and this is experimentally found by Bridgman to be the case.

The determination of the compressibility of 38 elements in the solid state by Richards and his students has been completed. The earlier values were referred to that of mercury. Recent determinations of the compressibility of mercury, however, by Bridgman, E. P. Bartlett, J. H. Hodges, and Richards, have fixed the absolute value for the compressibility of this substance within narrow limits, and a recalculation of the compressibility of the other elements to this standard has accordingly been made.

A comparison of the compressibilities of the elements with their atomic weights brings out clearly that this quantity, like the atomic volumes, coefficients of expansion, reciprocals of absolute melting points, etc., is a periodic function of the atomic weights. Particularly striking is the close parallelism between the curves of atomic volumes and of compressibility. Tungsten has the smallest compressibility of all the elements studied.

Turning to investigations at very low pressures, the researches of Langmuir on chemical reactions in the presence of electrically heated filaments attract attention. It appears that when a wire of tungsten, platinum, or palladium is heated in an atmosphere of hydrogen under reduced pressure, part of the gas is dissociated into atoms. This atomic hydrogen has remarkable properties; it readily condenses on glass surfaces, reduces metallic oxides, and reacts with oxygen and phosphorus at room temperature. Langmuir has calculated that the percentage dissociation of hydrogen under a pressure of 760 millimeters of mercury is 0.33 per cent at 2000°K, and 30.0 per cent at 3500°K, and that the heat of formation of ordinary from atomic hydrogen is 76,000 calories per gram mol, that is, appreciably greater than the heat of combustion (67,500 calories), of the same quantity of molecular (ordinary) hydrogen.

Of the work published in 1915, that of F. Haber and his co-workers on the thermal and chemical behavior of ammonia stands out prominently as a thorough and accurate scientific study of a problem of high technical importance. The results of these researches which have occupied some four years, appear in a series of articles in the *Zeitschrift für Elektrochemie*. As is well known, the amount of ammonia produced in the reaction $N_2 + 3H_2 = 2NH_3$ from a given amount of hydrogen and nitrogen, if all three are allowed to remain in contact until equilibrium is reached, is dependent upon the pressure and the temperature (see article AMMONIA in the NEW INTERNATIONAL ENCYCLOPEDIA, 2nd Edition). Two of the papers in this series deal with the equilibrium constant characteristic of the reaction in question at 1 atmosphere and at 30 atmospheres from 580° to 1100°C. The method consisted briefly in allowing a mixture of hydrogen and nitrogen to pass under constant pres-

sure through an electrically heated quartz tube containing the osmium catalyzer. The temperature of the tube was kept constant. The volume of mixed gases passing into the reaction tube was measured by means of a gas meter. The gases passing out were allowed to flow through wash-bottles, which removed the ammonia, and then through a second gas meter, readings on which recorded the amount of nitrogen plus hydrogen remaining uncombined. Two other papers of the series deal with the heat of formation of ammonia at 0°C and from 466°C to 659°C. Still another paper discusses the efficiency of uranium nitride as a catalyzer and also the dependence of the amount of ammonia formed in the reaction on the rate of flow of the gases through the catalyzing chamber. It is shown that although the percentage of ammonia in gases which have passed over the heated contact substance decreases with increase in the velocity of flow, the total amount of ammonia formed increases with the velocity.

Ernst Cohen has continued his long series of researches on the allotropy of the metals. To summarize the results, he has found that most of the metallic elements exist in allotropic forms and that as ordinarily known the elements are really mixtures of different forms in metastable equilibrium, the proportions of these forms present in any given specimen of the element depending upon the immediate thermal history of the specimens. Methods have been found for preparing the different allotropic forms in pure condition, and some of their physical properties have been measured. The importance of these discoveries is evident. The heat of fusion, heat of reaction, and in general all the physical and chemical properties of an element will differ for the different allotropic modifications. The determinations of these quantities carried out by previous investigators were, not upon individuals, as supposed, but upon mixtures of indefinite composition. As a matter of fact, the values for the heat of fusion of sodium found in the literature show differences of 80 per cent and those for lead of 20 per cent. The most recent work by Cohen, and by Cohen and Heldermaun includes studies of the allotropic forms of lead, bismuth, zinc, antimony, potassium, and cadmium.

H. Kamerlingh Onnes, who succeeded in liquefying helium, has continued his work at low temperatures. His latest researches include determinations of the vapor pressure of hydrogen from the boiling point to the triple point, and of carbon dioxide from -160°C to -183°C, of the critical points of oxygen and nitrogen, and of the specific heat and thermal conductivity of mercury at temperatures obtainable with liquid helium. Most sensational are the extraordinary electrical conductivities of metals at temperatures in the neighborhood of the absolute zero. The conductivity of lead, for example, at 1.8° absolute, is 200,000,000 times as great as at ordinary temperature. With such a "superconductor" Onnes was able to imitate a permanent magnet. A closed coil of lead wire having a resistance of 736 ohms was placed in a cryostat containing liquid helium, and a current of 0.8 amperes was induced in the coil by withdrawing a magnet from its vicinity. After one hour the current flowing through the coil had not appreciably decreased.

The lead coil with its continuously encircling and but slowly decaying current has, of course, the properties of a magnet. With regard to the theoretical bearings of Onnes's experiments on "superconductors," it may be noted that they strike a death blow at the electron theory of electrical conduction. Neither the number of electrons in the conductor, nor their velocity can possibly be conceived to increase with lowering of temperature.

Radium preparations have been tried to such an extent in medicine that it is not surprising to learn that experiments on their effect on plant growth have been made. But the results are somewhat startling. Stoklasa and Zdobrisky treated various plants with water in which radium emanation had been dissolved. Lentils, peas, and wheat registered gains of 62, 116, and 164 per cent respectively over the control plants which had not been so treated. Rusby used radium ore tailings to enrich several acres of land. Of the 27 kinds of vegetables that were planted, only three failed to show a gain under enrichment with radium. The average increase was 30 per cent. Using a method which he has developed for determining the radio-active content in a fifty-pound sample of soil, Sanderson analyzed thirteen typical Minnesota soils for radium and thorium. Without exception the soils comparatively rich in radio-active content were fertile, and vice versa.

ORGANIC CHEMISTRY. When one views the ponderous volumes of Beilstein's great reference work on organic chemistry, one might almost think that that science would present a poor field for further research. But when one considers that, as Holeman calculated in 1915, of the 5000 possible benzol derivatives containing two and three common substituents only about 7 per cent have actually been prepared, it becomes evident that organic chemistry still offers alluring opportunities.

A doubting attitude toward the value of preparing new compounds and new classes of compounds, is almost as unreasonable to-day as it would have been a quarter of a century ago. Without knowledge of amino acids, nothing could have been accomplished toward protein analysis; sugars led to glucosides; purines to nucleic acids; butadienes to rubber synthesis—the list might be continued indefinitely.

For several years organic chemistry has more and more concerned itself with substances of biological origin. Emil Fischer's researches on sugars, purines, proteins, polypeptides, peptides, and glucosides, which comprehend volumes, are all of great importance biologically. Wallaech has devoted much of his time to the terpenes—another class of biochemical substances. Wilstätter, Piloty, Hans Fischer, and others are steadily progressing toward knowledge of the structure of chlorophyll and hæmoglobin. Cellulose, starch, cholesterol, and the still unexplained alkaloids show signs of yielding to the efforts of skilled workers.

During the year, in addition to his chlorophyll contributions, Wilstätter investigated the red, blue, and violet coloring matter of flowers and fruits. These substances, known as anthocyanins, are usually present in small quantities, although the dry petals from the dark-red dahlia may contain as much as 20 per cent of pigment. The anthocyanins are glucosides or

galactosides having one or two six-carbon sugar molecules combined with the pigment proper. They contain no nitrogen, but are basic in properties. In their preparation a large quantity of dry petal meal was extracted with glacial acetic acid or acidified alcohol and an impure anthocyan oil precipitated with ether. Recrystallization of the picrates gave nicely crystalline pure products. The anthocyanins have been named, from their sources: pelargonin, cyanin, delphinin, pæonin, and so forth. Hydrolysis of these anthocyanins with strong hydrochloric acid gives the sugar and the chlorides of the anthocyanidin pigments of pelargonidin, cyanidin, delphinidin, or pæonidin. Of these, cyanidin and pelargonidin have been synthesized by Wilstätter, and the structure of nearly all has been determined. They all contain trihydroxy-benzol, and a mono-, di-, or trihydroxy-benzoic acid or its methoxyl derivative. Anthocyanins occur in nature in various colors. The acid salts are red, the alkali salts blue, while the neutral bases are violet. The blue corn flower contains the potassium salt of cyanin. Anthocyan solutions are decolorized by isomerization in neutral solution, but the color is restored by addition of acid. Wilstätter has suggested that vari-colored petals are so, not because of heterogeneous distribution of oxidases, but because of differential hydrogen ion concentration.

Osborne and Mendel's *feeding experiments* with isolated proteins have now yielded sufficient data to justify some discussion of their biochemical aspects. All previous experiments of this nature had been limited to more or less empirical food mixtures. Now, however, that chemistry is in possession of a number of comparatively pure vegetable proteins and of a knowledge of their hydrolysis products, a really scientific study of nutrition has become possible. Albino rats were chosen for the experiments in question for several reasons: their food requirements are small, and they are easily cared for; their growth rate has been exhaustively investigated by the Wistar Institute, and the life period was found to be only about three years, so that a short period is comparable with several years in man. It has for years been recognized that gelatin lacks one or more constituents necessary to the maintenance of life. Osborne and Mendel have found that zein from corn, hordein from barley, and possibly other proteins are inadequate to sustain life, although fully digested. But the addition of the amino-acids, known as tryptophane and lysine, renders the above proteins fully adequate to sustain life and promote normal growth. Some few amino-acids are apparently incapable of synthesis by the body; but disproportionate amounts of the various amino-acids in the ingested protein, or even the absence of some of them does not seem to affect nutrition. Rats have been bred through three or four generations upon a diet containing glycocholate-free casein as the sole protein. A female rat fed on sugar, starch, fat, and a mixture of inorganic salts simulating bone-ash, produced a litter of three young and nourished them to normal growth rate. These facts suggest some startling questions. It seems extremely improbable that these peculiarly fed rats differed from normally fed ones in body composition. But then, are we to con-

clude that from a protein of such peculiar constitution as gliadin, from carbohydrates, and a mixture of inorganic salts, the female has synthesized her own complex body constituents and also secreted a perfectly normal milk? Fats, too, are not essential, as rats were grown at normal rates on food completely free from fat.

The question whether growth may be deferred until old age was also taken up with very interesting results. Since gliadin is incapable of promoting growth, although furnishing body maintenance, young rats were kept on such food until long after the period at which normal growth would have ceased. But when now a mixed diet was introduced, the animals grew to adult size at a normal rate. Is there stored in each animal a substance capable of promoting growth under proper nutritive conditions, but remaining quiescent and itself unchanged as long as the nutritive conditions are abnormal?

Among items of interest is the isolation, by Scherndal, of "azulene," the blue hydrocarbon occurring in very small quantity in terpene oils. Scherndal ascribes to it the formula $C_{10}H_8$, and believes it to be highly unsaturated. The substance was isolated by its solubility in concentrated H_2SO_4 .

Fischer, having already prepared theophylline-glucoside and methyl-glucoside, has gone a step further in the synthesis of nucleic acids by combining the above glucosides with phosphoric acid. At the present stage, the purine-glucoside-phosphoric acids appear to bear to nucleic acids somewhat the same relation as polypeptides bear to the proteins.

Although negative in result, the attempt of Padoa to dissolve graphite from various sources in decaacylene is interesting. The general rule that "like dissolves like," coupled with the hypothesis that graphite is made up of cyclic carbon molecules, pointed to the desirability of such an experiment.

Japan lac has been shown by Majima to consist in large part of 1-pentadecyl 2,3 dihydroxy-benzol. The substances urushiol and hydro-urushiol were isolated and shown to give palmitic acid on oxidation. By a very nice synthesis, using 2,3 dimethoxy-phenyl-propionic acid chloride and the sodium salt of decylacetylene and subsequent reduction, Majima obtained a substance identical with the methyl ether of hydro-urushiol. Hydro-urushiol is of interest inasmuch as naturally occurring analogs lead one to suppose that the substance would be 1-pentadecyl 3,4 dihydroxy-benzol, but the synthesis of this compound eliminated this hypothesis.

An organic review would be incomplete without mention of Abderhalden. Toward the close of the year he published his synthesis of optically active fats. Naturally glycerides are known which exhibit optical activity, but these are composed of optically active acids and inactive glycerol. In this new class of substances the middle glycerol carbon atom is asymmetric. These new fats are prepared from 1- or d-epihydrin alcohol or active amino-glycerol and exhibit rotations of .5-2.6. No optically active fats occur in nature, and it seems probable that no enzyme exists which might resolve racemic fat mixtures (if such exist) into their components.

CHEMISTRY, INDUSTRIAL. (See also

CHEMISTRY, GENERAL PROGRESS OF.) The great war in Europe had a potent influence on industrial chemistry. The sending of men engaged on researches either in laboratories or universities to the front of course prevented the usual amount of chemical investigations. Curiously enough also the impossibility of sending finished products from Germany and others of the Central Powers to the usual markets compelled the undertaking of measures to produce articles never before made outside of Germany in order to fill the demand for current work. This was conspicuously the case in the United States, where extraordinary efforts were made, notably in the case of dyestuffs, aided by the efforts of the Bureau of Foreign and Domestic Commerce, to bring about the manufacture of materials in America to replace those that formerly came from Europe.

ORGANIZATIONS. The Ninth International Congress of Applied Chemistry was to have been held in Petrograd, Russia, during Aug. 1-14, 1915, under the presidency of P. I. Walden, but was postponed owing to the war in Europe. The previous congress was held in Washington, D. C., during Sept. 4-13, 1912. The American Chemical Society held its spring meeting in New Orleans, La., during April 1-3, 1915, and its summer meeting in Seattle, Wash., during Aug. 31-Sept. 3, 1915. The total membership had reached the large number of 7400. The president during the year was Charles H. Herty of the University of North Carolina.

The Society of Chemical Industry held its thirty-fourth annual meeting in the Municipal School of Technology in Manchester, England, during July 14-18, 1915, under the presidency of Prof. George G. Henderson. The membership was reported as 4017, as compared with 4142 last year. The formation of local sections in Edinburgh and the east of Scotland was announced. Dr. Charles C. Carpenter, of the South Metropolitan Gas Co., London, was chosen president, and for the next meeting Edinburgh, Scotland, was selected.

NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES. During the week of Sept. 20-25, 1915, there was held in the New Grand Central Palace in New York City a National Exposition of Chemical Industries at which exhibits and demonstrations of products, processes, machinery, and apparatus applied in the chemical industries were made by leading manufacturers from all over the United States. The most important of these were those that demonstrated the efforts made by chemists to free the United States from foreign domination in the matter of chemicals and coal tar colors. It was in consequence of this fact, therefore, that the various bases used in making explosives as well as dyestuffs, including the anilines made by processes of Thomas A. Edison, attracted conspicuous attention. A study of the full line of exhibits demonstrated that resources existing in the United States, unheard of until the war began, have been used in the campaign for industrial independence, and the daily output of both chemicals and colors was steadily increasing. Motion pictures and lectures by chemical experts added to the value of the exhibits. A similar exhibition was projected for the year 1916 under the direction of a committee including among its members many of the leading chemists of the United States.

RELATIONS OF CHEMISTRY TO GOVERNMENTS. The members of both the Society of Chemical Industry and the Chemical Society of London, through their respective councils, proffered their services to the British government, and in consequence their membership was classified so that it was possible to furnish at a short notice a reliable and complete statement as to the sources of supply of particular chemical products, also to keep the government informed from the manufacturer's point of view of difficulties arising from time to time as respects labor, materials, transport, etc., which may be interfering with the output of essential chemical products.

Also an Advisory Council of scientific men was organized in Great Britain whose duties were to report to a committee of the Privy Council on (1) proposals for instituting specific researches; (2) proposals for establishing or developing special institutions or departments of existing institutions for the scientific study of problems affecting particular industries and trades; and (3) the establishment and award of research studentships and fellowships.

A Navy Invention Board was created in England, the duties of which are to coördinate and encourage scientific work in relation to requirements of the navy. Among the chemists appointed to the board are Herbert B. Baker, George T. Beilby, Percy F. Frankland, William J. Pope, and Sir William Crookes.

The French government, by a presidential decree, has created a special bureau in the Department of Commerce, for the duration of the war, charged with matters touching the production and supply in France of chemical and pharmaceutical products. The duties of this bureau are to determine the amount of existing stocks of chemical and pharmaceutical products, to estimate the present volume of production, and to secure production and distribution for the future.

In the United States the Secretary of the Navy announced the appointment on September 12th of a Naval Advisory Board of Inventions, consisting of 23 members with Thomas A. Edison as chairman. The representatives selected from the American Chemical Society are William R. Whitney of Schenectady, N. Y., and Leo H. Baekeland of Yonkers, N. Y.

MEDALS. On January 22nd the W. H. Perkin medal was awarded to Edward Weston for his work in connection with the development of the industries connected with the electro-deposition of metals, the electrolytic refining of copper, the construction of electric generators and motors, the electric illumination by arc and by incandescent light, and the manufacture of electrical measuring instruments. The Willard Gibbs medal of the Chicago Section of the American Chemical Society was, on April 17th, presented to Arthur Amos Noyes of the Massachusetts Institute of Technology for his investigations in industrial chemistry.

METALS. Aluminum. One of the results of the war in Europe was the transfer to American interests of the large aluminum plant in Stanley Co., N. C., by the foreign owners. There was a growing importance in the American production of this metal as shown by the value of its exports, which were \$1,101,920 for the year ending June 30, 1914, and a year later had increased to \$3,245,799. *Tungsten*, now so

largely used in the manufacture of high speed and other special steels, as well as in steel used for armament, was formerly obtained solely from Germany, but in order to meet the demand in England, a plant was established in Lancashire during the year. *Thorium and Mesothorium.* The salts of these rare metals are derived from the mineral monazite which is imported from Brazil, but the increasing use of thorium nitrate for incandescent gas mantles has agitated the possible utilization of the domestic supply. Monazite is found in North and South Carolina, Idaho, and on the Pacific Slope.

Radium. The demand for this valuable substance is also increasing. The Bureau of Mines reported a new and cheaper process for producing radium that differs from former methods not only in detail but in apparatus used. The time of operation is much shorter than in any other plant now producing radium, and the commercial recovery is much greater. Moreover, the cost of production is less. The market price of radium has been from \$120,000 to \$160,000 a gram, but the Bureau of Mines, with the plant under its supervision, is now able to produce it for \$37,000 a gram. The application of radium in the treatment of cancer and other malignant growths had made rapid progress during the years 1914 and 1915. Hospitals that have worked with as much as half a gram of radium reported cures in larger numbers. The extent and variety of cures reported and the helpful effects of the gamma rays at depth are almost in direct proportion to the quantity of radium that can be applied at one time to the patient. *Uranium and Vanadium.* In connection with radium there is reported a growing demand for the salts of these metals. The production of their compounds was greater during the year than ever before in this country. (See *The Rare Earth Industry* by S. J. Johnston, London, 1915.)

IRON AND STEEL. In October the Ford Motor Company of Detroit, Mich., announced that they had succeeded in making gray iron and malleable iron direct from the initial heat of the blast furnace. The elements while still in a molten state are changed, and refined, and finally finished, and poured direct into molds for gray iron or malleable castings, as the case may be. This new process not only effects a great economy in the cost of manufacturing, but also produces gray and malleable iron of much greater strength and durability. In January word came from Sheffield, England, that Thomas Firth and Sons had produced a stainless steel, which is nonrusting, unstainable, and untarnishable. This steel is especially adapted for table cutlery, as the original polish is maintained after use, even when brought in contact with the most acid foods, and it only requires ordinary washing to cleanse. It is said that it retains a keen edge like that of the best double-shear steel, and, as the properties are inherent in the steel and are not due to any treatment, knives can readily be sharpened on a "steel" or by using the ordinary cleaning machine or knifeboard. Later the same results were claimed by the Krupp Plant in Essen, Germany, by the announcement that they had developed a process for making steel that was absolutely immune against rust and even against the action of nitric acid.

POTASSIUM SALTS. With the cessation of the customary importation of potash salts from Germany and the danger of the interruption being continued indefinitely, there was a renewed interest in the possibility of securing a supply of these much needed compounds from domestic sources. Attention has been called in previous volumes of this YEAR BOOK to the work of the Department of Agriculture in searching the United States for sources of potassium salts to be used in the manufacture of fertilizers in place of those imported. Several sources were developed during the year. The first of these was the kelp which occurs in such vast quantities on the Pacific Coast where three varieties of seaweeds and rockweeds are found that contain large amounts of potassium salts. It was claimed that in the shallow waters of the Pacific Coast there was produced each year without cultivation a crop which, if simply collected and dried, possesses, as a fertilizer, at the market prices of potash and nitrogen before the war, a value of \$150,000,000. If used as a source of commercial potassium chloride, the product would have a value of \$90,000,000. The total cost of production was estimated at \$3.83 a ton, distributed as follows: cutting and collecting, \$1.83; drying, grinding, hauling, loading, etc., \$1; and general expenses, interest, etc., \$1. The total value of the ton based upon potash (\$9.07), nitrogen (\$5.93), and phosphoric acid (\$0.75) is \$15.75. Thus the margin for the refining of the crude material is nearly \$12 a ton, which, with the potassium chloride selling as high as \$2.05 a ton, seemed to offer a possible profit. In March a sale of 10,000 tons was reported in New York from this source at a price similar to that paid for the imported article. During the year ending June 30, 1914, 1,060,000 long tons of potash salts were imported from Germany for fertilizers which sold at about \$38 a ton. In October it was reported from the United States Geological Survey that a deposit of alunite in Utah was being worked, with the result that 200 tons of the mineral had been milled, yielding two tons of a product containing 99 per cent of potash. It was claimed that from this source alone adequate supplies of potassium salts for agricultural purposes could be obtained without any further importation from abroad.

An economical method of decomposing feldspar, of which there are large deposits in the United States, resulting in the salvage of potassium carbonate and of aluminum, was announced during the year. From the potassium carbonate thus recovered almost any of the salts of potassium could be obtained. The process consists of heating the feldspar with limestone and iron oxide at a temperature of about 2200 degrees F., which produces a partly fused mass that is easily decomposed by a weak acid. From this product the potash salts can readily be extracted for further purification. A practical tryout for another method of obtaining potash fertilizer was announced at a New Orleans distillery where molasses was used in large quantities. It is a fact that 106 tons of potash are wasted daily by the 25 or more distilleries where molasses is subjected to process of fermentation. The sugar beet waste in the United States, it is said, could be made to yield enough potash to supply the entire present de-

mand of the chemical manufacturers. About a third as much is lost annually in scouring the country's raw wool clip, and much of this could be recovered. Still another source is the salt incrustated valley floor commonly known as Searles Lake, in southeastern California, where a deposit of 4,000,000 tons of water soluble potash salts is available.

Other sources mentioned include the seaweed from the Sargasso Sea in the central Atlantic Ocean which, however, does not yield as much potash or nitrogen as the Pacific kelp. The ash of seaweed collected on the shores of Manila Bay gave 15 per cent of potash, an unusually large amount. Deposits of potassium salts in Spain are also known, notably from the province of Cataluña, but their commercial development has never been successful. The production of potassium salts in the United States from the different sources mentioned is chemically feasible in each instance, but the high cost of railroad transportation is the factor that has thus far prevented their commercial success.

SYNTHETIC AMMONIA. The *London Journal of Gas Lighting* published a process which allows of gas producers being utilized to manufacture ammonia by synthesis that has been devised by Adolph Bambach. By its aid atmospheric nitrogen can be fixed in the form of metallic compounds, both carbureted and nitrogenous (cyanides, cyanamides, etc.), or metallic nitrogen compounds (nitrides), and these substances decomposed, either with saturated and superheated steam or with water, to extract the ammonia.

NEW METHOD OF MAKING SULPHURIC ACID. The new feature of the method was that the gases employed are drawn downward through a spiral flue in place of being drawn through lead chambers or intermediate towers. It was asserted that the resistance of gases to the downward pull and the constant change in their course through the spiral tend to mix them very intimately. The fact that the gases constantly impinge on the walls of the spiral flue, which can be cooled either by air or water, makes it practicable to maintain the gases at a temperature most favorable for the efficient yield of sulphuric acid. In laboratory tests in which the spiral was used practically all the sulphur dioxide was oxidized to sulphuric acid, only traces being lost through escape or in the system. The lead spiral, however, was not intended to replace the Glover tower, nor to do away with the Gay-Lussac tower. It was believed that while the lead spiral would take considerable lead, the great reduction it would effect in the chamber space would make it possible to construct a plant with considerably less lead than is required in the ordinary chamber system.

BONE BLACK AND CHARCOAL. Waste bone black formerly discarded by refiners of sugar, petroleum, and glucose, and by other decolorizing institutions was the subject of serious study in Germany. The method of refining largely determined what disposition would be made of the waste material, and in large sugar refineries filtration processes are essential. If the waste bone black is used as an absorbent during the filtration it cannot be sold for other industrial purposes without being revived and again purified. Recently filter presses were so

improved that they largely could be used instead of bone black. Various German patents treat of processes to purify bone black after it has been used as an absorbent. One of these patents covered a process to purify bone black, using a gaseous sulphurous acid instead of diluted hydrochloric acid.

German chemists were making progress in the use of animal charcoal for medical purposes. It was discovered by experiments on animals that different kinds of poisonous substances, such as morphine, strychnine, and carbolic acid, lose partly or entirely their effect when given with animal charcoal. Not only can directly administered poisons be neutralized in their effect upon the organism by animal charcoal, but also poisonous substances which arise in the intestinal canal, as in the case of cholera. The action of animal charcoal extends to the bacteria themselves, which it mechanically absorbs, destroying their destructive influence. The labors of Freundlich, Lichtwitz, Glassner, and Suida show that the absorbing quality of animal charcoal is promoted by the presence of the phosphates, sulphates, and nitrates of calcium, sodium, and potassium. The rapidity of the absorption increases with the temperature, so that the heat of the animal body aids the therapeutic effect of the animal charcoal.

UTILIZATION OF PEAT. Late in the year a new process for the distillation of peat was patented in Great Britain and other countries by which coke, fuel oil, tuluol, ammonia, paraffin wax, and acetone are obtained in valuable quantities. The process is in practical operation and promises to revolutionize the peat industry and to furnish sources of fuel oil to the British navy which may make it independent of foreign oils. Peat, as taken from the peat beds, contains from 80 to 90 per cent of water and is of a fibrous cellular structure, so that by hydraulic pressure it is possible to lower the water content only slightly. An important part of the new process is a macerator that breaks up the fibrous cellular tissue and thus allows a more complete separation of the water. After passing through the macerator the broken peat is compressed into briquets, which are dried until they contain not more than 25 per cent of moisture, and then fed into a hopper from which they pass into the retort.

Irish agriculturists were greatly interested in the discovery by W. B. Bottomley of a method of converting ordinary peat into a highly concentrated fertilizer by a simple and inexpensive bacterial treatment. Professor Bottomley's principle is that bacteria facilitate the chemical processes connected with plant growth, and the peat bacterial culture immensely facilitates food absorption by vegetables and other farm crops. He has exhibited specimens of mature potatoes grown in seven weeks by the use of the peat fertilizer, and says that an acre of land treated with one ton of the peat manure has produced 41 per cent more potatoes than an acre treated with 80 tons of ordinary farm manure.

The Swedish experts commissioned to examine Laval's method of carbonizing peat reported the processes employed were as follows: The peat is diluted with a large quantity of water, the resulting pap is then heated to a temperature of 150° to 250°C. The chemical changes

thus produced leave a dry mass of an increased heat value, though reduced in volume, the physical constitution of the material being altered in such a way that water can be removed in a much larger proportion than would have been possible with the original peat. After the water has been partially removed by pressure or suction a product is left containing 50 to 70 per cent of water. By artificial drying peat powder is then easily prepared, to be used in the manufacture of briquets.

According to a Friesland newspaper, the municipal gas works at Akkrum, Holland, was extracting gas from peat mixed with coal. It was stated that if peat alone were used, the retorts would become too hot, because of the steam created by the moisture always found in peat. Accordingly the retorts are filled with two parts in weight of coal to one part of peat. The peat—as well as the coal—produces about 30 cubic meters of gas per 100 kilos (220.46 pounds). The gas produced from this mixture was declared to be of excellent quality. The peat is entirely consumed in the process, and therefore yields no by-products, as coal does in tar and coke.

CEMENT FROM BEETS. Excellent cement was being made in France from a by-product in the process of making beet sugar. The scum that forms when beets are boiled, and which has been thrown away, consists largely of calcium carbonate and water; and from 70,000 tons of beets treated, 4000 tons of calcium carbonate is obtained; to this 1100 tons of clay is added, the resulting product being 3162 tons of excellent cement. The scum is pumped into large tanks, where it is allowed to dry partially; finely divided clay is then mixed with it; the mixture is thoroughly amalgamated by beaters for an hour and burned in a rotary kiln, in the same way as Portland cement. The clinker is then removed and pulverized into cement.

CARBIDE SLIME AS BUILDING MATERIAL. In the manufacture of acetylene gas (from calcium carbide and water), considerable quantities of so-called carbide slime are left in the apparatus. In view of the large increase in the consumption of acetylene since the outbreak of the war, a report of R. Schumann on the utilization of carbide slime was of interest. The material could not be used as fertilizer, phosphorous salts being absent, but might be used as water purifier when of a certain composition. Experiments with the employment of carbide slime as building material yielded the best results. When mixed with 40 per cent of building sand, the carbide slime formed a usable mortar which set well and bound the bricks firmly. This new building material was to be thoroughly tested by further experiments.

A NEW ALLOY. The United States government was experimenting in the Brooklyn Navy Yard with a new alloy of aluminum and copper invented by L. C. Smith, intended for use in army and navy projectiles. It had the appearance of gold and was said to have the wearing qualities of Egyptian bronze that was manufactured some 6000 years ago, but which has never been reproduced since. There were about 10 alloys of aluminum and copper on the market which had been used as substitutes for copper and bronze. The chief difficulty in getting a composition of durability is to get the aluminum and copper to fuse. Tests were

also being made on battleships, where the alloy is being made to make fittings water tight. Other experiments are being made at the United States mint in Philadelphia with a view of substituting the alloy for the copper in one-cent pieces.

EXPLOSIVES. From Sweden a new explosive was announced that was very powerful, and one of the principal ingredients is ammonium perchloride prepared in a special way. "Kausolit," as it was called, has great explosive power and seems especially adapted for shells. An important discovery was reported by the Du Pont Powder Company whereby the time required to manufacture smokeless powder was greatly reduced. Under a new method adopted, the drying process took only 5 days instead of 60 days as heretofore. Only 21 days were required to turn out the finished product.

PAPER MAKING. Among the various materials advocated during the year as sources for making paper was the long leaf pine in the United States, while from Mexico came reports of excellent results from the use of henequen stalks and waste. Wrapping paper and strawboard were made in Venezuela from an aquatic plant that grows in large quantities on the margins of Lake Tacangua. A commercial paper pulp was made from the fibres of the Neuquen and Misiones pines in Argentina, and it was said that the fibres from these two varieties of pine trees when heated with bisulphite yielded a pulp surpassing in whiteness that of paper materials imported from Europe. From the searches made for raw materials to supply the demand for paper in Great Britain reports were received from the Union of South Africa, suggesting the use of papyrus and the tambookie grass, while from India the use of *Hedychium coronarium* was recommended. Experiments in Brunswick, Germany, showed that willow tree bark and broom fibres failed to yield satisfactory results, but from the fibre of hop vines an especially long fibre was available from which paper could be made.

A curious experience growing out of the war has been the shortage of filter paper used in analytical and technical chemistry owing to the inability of obtaining stocks of this material from Germany. To meet this condition the firm of W. and R. Balston of Maidstone, England, makers of the Whatman drawing paper, began to produce for the first time in England a filter paper that would compete with the German article. Reports showed that their paper had been used with universal approval. In the United States the problem came before the Bureau of Standards and was being studied by the experts of that bureau from the point of view that the present time was opportune for starting this new branch of an important industry.

SOAP FROM SUGAR. The discovery is announced from Hamburg of a method of manufacture of soap from sugar, of which Germany has plenty, instead of from oil, which is scarce. In the past it had been possible to use sugar only in soaps that had little value. By the new method, it is claimed, the soap produced is not only fine and delicate, but it acts as efficiently in salt water as in fresh, a fact that may make the soap valuable for the navy.

NEW METHOD OF EXTRACTING LEMON OIL. A new chemical process invented by Professor Li-

otta of Catania, Italy, may revolutionize the lemon oil industry. All previous chemical processes caused changes in the properties and smell of the essence, but the new method does not affect the oil in any way. The new process is as follows: The lemons are mashed in a large receptacle, and an acid, the nature of which is secret, is added. This acid causes the essential oil to separate and rise to the surface, from which it is drawn off. A chemical reagent is then added to the acid mixture that liberates the acid and permits its recovery. The residue, consisting of lemon juice, pulp, and peel, and foreign matter, is then sold to citrate manufacturers. The new process, it was claimed, would save about 2½ per cent more oil than the old hand process. The cost of extraction is 2.3 cents for 1000 lemons, and the process requires 22 minutes.

RUBBER. The advent of the war led to new uses, as there was rubber so treated as to make vessels unsinkable; there was the buffer of rubber that, when collisions occur at sea, gives only a slight tap; there was the sheathing of rubber for battleships, from which the enemy's shot and shell will rebound; and there were the rubber-studded blocks for fixing steel rails in chairs.

Successful attempts were made to manufacture a substitute for rubber tubing out of masses of solidified glue. These tubes, whose trade name is "Sonjatin," are better than those of rubber for certain purposes, since they are more impervious to gases and more resistant to heat. It was also claimed that they do not grow rotten so quickly as rubber and that when encased in a suitable envelope they will withstand high pressure. The inventor, J. Traube, stated that they were also peculiarly suited for conductors of petroleum and gasoline.

A valuable discovery, it was claimed, had been made in Ceylon in the use of coconut water as a rubber coagulant. This method, if as successful as experiments would indicate, should prove a great boon to the rubber industry. Millions of gallons of coconut water, which now runs to waste on estates in copra drying and desiccation mills, can be utilized as a profitable by-product, besides producing a superior coagulant in making rubber.

NEW PROCESSES FOR COAL AND PETROLEUM PRODUCTS. There had been in recent years a growing demand for gasoline owing to its increasing use for motor vehicles. Also for many years the United States had imported from Germany the special products of the distillation of coal, such as benzol and toluol, used in the manufacture of coal tar dyestuffs. In March the Bureau of Mines announced that Dr. Walter F. Rittman, a member of its staff, who had been working in the chemical laboratories of Columbia University, had found that by treating vapor of petroleum instead of the liquid itself he could get greater pressure than by use of the still. In the still, pressures of 100 pounds are high, and an undue increase of heat after that pressure is reached is usually dangerous. Gas, however, is compressible to a much greater degree than 100 pounds without danger of explosion in apparatus of the type used, and, in his experiments, Rittman has succeeded in working with a pressure greater than 500 pounds. With such pressures and with a degree of heat perfectly controllable by the

means used, the Rittman process not only delivers gasoline to the amount of from 50 to 75 per cent, but permits him to obtain benzol and tuluol at will. By this invention, it was claimed, 200 per cent more gasoline could be obtained from a given quantity of petroleum than had been possible in the past. Rittman's process was patented "for the general use of the public."

A still further application of the "cracking" principle was the discovery by Dr. Walter O. Snelling of the conversion of natural hydrocarbons of all kinds, such as vaseline, red wax, fuel oil, etc., into "crude oil" capable of yielding gasoline. To bring about this change, the oil or wax is heated in a tight vessel, but it is apparently necessary that the ratio of the volume occupied by the substance to the empty space above it should not vary above or below certain limits. Not less than one-tenth of the vessel nor more than one-half must be occupied by the oil, otherwise the change does not take place. The reason for this remains yet undiscovered, but the advantages of being able to obtain gasoline from a great variety of substances instead of from only one is obvious.

W. A. Hall, an American inventor, has patented in England a process which he described as follows: "I take a cheap hydrocarbon, such as gas oil, and I subject this to a temperature of about 650°C., under a pressure of about 70 pounds to the square inch in a suitable coil of pipe, whereby the oil is cracked and a considerable portion gasified. From this coil of pipe, called a 'converter' the mixture of oil vapor and gas produced is passed through suitable coolers whereby the temperature of the mixture is lowered to about 200°C., and the mixture fractionally condensed in a suitable separator with or without reduction of pressure. Those portions of the mixture nonvolatile at about 200°C. are thus extracted in the liquid state. The gas and the remaining fractions of liquid, volatile at the approximate temperature of 200°C., may, if the pressure has not been reduced, be conducted directly through a cooler and condensed under the pressure of the converter, or, if the pressure has been reduced in the separator, may be recompressed by means of any suitable mechanical compressor, and then condensed under pressure in the cooler." A plant yielding about 6000 gallons daily of this "motor spirit" was erected in England and the product taken over by the British government.

By the discovery of these processes the United States thus became independent of foreign manufacturers; for by their use not only was cheaper gasoline possible, but the crude materials, notably benzol and tuluol, used in the manufacture of explosives, coal tar dyestuffs, synthetic drugs, etc., are now readily available. See *The Chemistry of Petroleum and Its Substitutes*, by C. K. Tinker and F. Challenger (London, 1915).

NEW DYESTUFFS AND PROCESSES. The establishment of new plants in the United States and the allied countries led to the publication of improved processes and of new dyestuffs. The most important in the United States was the formation of the Pearsite Company with a capital of \$2,000,000, and with the equipment of a large plant in Cannel City, Ky. For this corporation the announcement was made that their operations were based on a new process

dependent upon the use of oxidized cannel coal. In September they began the delivery of the following colors: a sky blue, a direct black, a benzol red, a wool black, and a direct green. The output at first was 5000 pounds of colors a week, but the expectation was of reaching 40,000 pounds a day when the plant was in complete running order. H. A. Frasch, a New York chemist, revived his discovery of "petracin," a compound made from the sludge acid of petroleum refining and from which he had been successful in making a series of colors and dyestuffs. From England came the announcement early in the year of the successful employment of sulphur dyes for dyeing wools and fabrics other than cotton (for which sulphur dyes have been hitherto exclusively applied). It had been discovered that these sulphur dyes might be used with success for wool, silk, artificial silk, hemp, and other fibres, which can be dyed either separately or in combination. As sulphur dyes are cheap and will, as opposed to aniline dyes, add to the properties of milled cloth, the new process is a valuable one. During the year it was announced that the chemical department at Leeds University in England has succeeded in manufacturing a cheap dyestuff for use in dyeing khaki for soldiers' uniforms. Formerly England was compelled to use dyestuffs of German manufacture on all khaki cloth. See *Dyestuffs and Coal Tar Products*, by Thomas Beacall and others (London, 1915).

DYESTUFF SITUATION IN THE UNITED STATES. In August, 1914, in consequence of the war in Europe the importation of dyestuffs practically ceased. At that time the consumption of artificial dyestuffs, derived chiefly from coal tar products, had an annual value of about \$15,000,000, of which the imports from Germany were \$7,850,000, Switzerland \$910,000, and Great Britain and other countries \$370,000; with added amounts paid for duties, about \$2,000,000, and expenses and profits, the sum annually expended for foreign coal tar dyes exceeded \$12,000,000. Besides the textile industries, the paint, varnish, and ink trades, the paper industry, the feather and leather trades, and other minor industries were threatened with disaster unless some means were devised to furnish them with the needed coloring materials. Accordingly on January 26th, the United States Senate directed the Secretary of Commerce to report fully the facts relating to the supply of dyestuffs for American textile and other industries, as well as the sources of such supply, the extent and nature of the supply, and similar information. The duty of gathering this information was assigned to the Bureau of Foreign and Domestic Commerce, and Dr. Thomas H. Norton, the well equipped and expert chemist, prepared a preliminary report on *Dyestuffs for American Textile and other Industries*, which was issued over date of March 20th. Meanwhile at the beginning of the year there were four establishments in the United States having an annual output valued at about \$3,000,000. Each of these plants specialized in their products for some particular trade as woolen goods, cotton, paper, etc.

The problem therefore was how to increase the output from various sources to meet the demands for dyestuffs that formerly came from abroad, and also how to retain the industry permanently in the United States. One important element in the demonstration of the power

of what American ingenuity, enterprise, and capital were capable of, was the National Exposition of Chemical Industries, held in September, where it was shown that the output of dyestuffs had quadrupled within the year. The field was one that offered considerable promise, and soon many of the American coke ovens equipped their plants with appliances for the production of coal tar bases from which the dyes were manufactured. The most difficult part of the problem was the manufacture of the intermediate compounds from which the finished dyes are produced. Of these aniline oil is the most important and by May it was officially reported that the supply of this article was sufficient to meet the demands of the dyestuff makers in the United States. New corporations with ample capital were organized by large financial interests, such as the Du Pont Company of Delaware and the Standard Oil Company of New York and numerous plants in various places were started. New and improved processes, and new dyes were constantly reported during the year. A report issued by the Bureau of Foreign and Domestic Commerce towards the close of the year showed the 1915 production of American coal tar dyestuffs to be at the rate of approximately 9000 short tons a year, whereas in 1913 the rate was 3000 tons. It was now confidently expected that by the end of 1916 the output would reach 16,000 tons as against 22,000 tons imported from Germany in 1913. In that year practically all of the intermediates used by domestic color manufacturers came from abroad; at the end of 1915 they were produced in the United States. It was predicted that by 1920 the great bulk of artificial dyes consumed in the United States would be made in America from American raw materials. The cost of production and the selling prices of these materials were higher than those of similar products when imported, but it was demonstrated during the year that the United States could produce sufficient coal tar raw material for the needs of a complete domestic coal tar industry inclusive of explosives and dyes, provided there was a certainty of outlet as to volume and continuity. Attention was called to the fact that domestic manufacturers were prohibited by law from making use of cooperative devices, such as pools, trusts, manufacturing and selling agreements, and the like, while such devices were regarded as lawful and encouraged by European governments, so that alterations in the tariff were essential in which the consumer in the first place, and the public in general must share in the burden imposed if the dyestuff industry, so auspiciously started, was to be preserved in the United States.

THE DYESTUFF SITUATION IN EUROPE. The conditions in Great Britain, France, Italy, and elsewhere in Europe were somewhat similar to those described as existing in the United States. In England, without attempting to discuss the details, the conditions were met by the organization of a national company in Manchester incorporated as the "British Dyes (Ltd.)" with a capital of £2,000,000 which the government increased by £1,500,000 at 4 per cent to be paid in 25 years; also the government added £100,000 for a research laboratory. The largest existing plant in England for the manufacture of aniline dyes at Huddersfield was secured and actual manufacture began in May. It was believed

that from these works the greater portion of the artificial dyestuffs required in England could be supplied. The vogue for brown in 1915 was said to be due to the existence of large stocks of this color in England at the beginning of the war, and with its exhaustion gray was said to have become fashionable.

From Italy came reports of shortage of dyestuff, resulting in the closing of dyeing establishments. The factories used for the production of munitions of war, it was said, would be converted into plants for the manufacture of dyestuffs when hostilities cease. In Russia a project for the manufacture of coal tar colors was advanced. It was to have a capital of \$5,000,000, of which about one-half was to be supplied by firms requiring dyestuffs in their business. In France a similar plan was adopted. A national company was organized with an initial capital of \$10,000,000, the government to advance \$5,000,000 at the rate of \$1 for every \$5 subscribed by the public and an additional \$2,500,000 at the rate of \$1 for every \$4 subscribed. For the government advances 4 per cent was to be paid. A grant of \$500,000 for a research laboratory was also made by the government. The condition in Switzerland became a most peculiar one. The factories in that country were dependent upon Germany for their crude material, but at the beginning of the war Germany declined to furnish any more crude materials unless Switzerland would refuse to export the finished dyestuffs to countries with which Germany was at war. As the manufacturers in Basel declined to do this they soon found themselves compelled to close their factories. Under these circumstances they made overtures to American manufacturers for crude materials, agreeing to pay for them with finished products. See *The British Coal-tar Industry, Its Origin, Development, and Decline*, by Walter M. Gardner (London, 1915).

COTTON SUBSTITUTES. Since the beginning of the war in Europe there was an unusual demand for cotton, both for use in the manufacture of explosives, as gun cotton, and in medicine, as absorbent cotton. Reports from Germany indicated the use of ordinary wood pulp as a basis for high explosives, although the presence of rosin and oxy-cellulose renders its action uncertain as well as highly dangerous to those manufacturing the explosive. French experts reported that the ballistic power of nitro-lignose was not equal to that of gun cotton. "Lignin" is made of pine cellulose and is sold in Berlin as a substitute for absorbent cotton. It was said to absorb blood better than cotton but was not as good a dressing for a wound. In Sweden cellulose wadding from chemical wood pulp was made for dressing wounds. It is sold in thin sheets, like tissue paper, but crimped. The English found the bog moss, *Spagnum cymbilifolium*, of great value as a surgical dressing. It is antiseptic, soft, light, and cool, and has only to be sterilized and placed in flannel bags for use.

ASPHYXIATING GASES. A curious phase of industrial chemistry was to be found in the use of poisonous gases for the injury of combatants in warfare. This method of destruction called upon knowledge from most of the arts and sciences and each step in the evolution of its use was an additional application of scientific knowledge. As used in May, Sir John French reported that the gas was emitted from cylinders

during a period of four and a half hours. The greenish color, the strong odor, and the great density of the gas, causing it to flow along the ground seemed to indicate that it was chlorine; moreover, the symptoms of those inhaling it tended to confirm this opinion. Later it was said that three kinds of gas were used, namely, chlorine, bromine, and nitrogen peroxide. The last was described as paralyzing the soldiers from their waist down. According to German authorities the gas was described as a synthetic product of some complexity, the ingredients so far defying analysis. Sodium sulphate and oxygen are said to be used to neutralize the effects of these gases. Masks impregnated with neutralizing chemicals were used, and those employed by the Germans were said to contain sodium hypophosphite. According to the *Bulletin* of the Alliance Française, a "liquid fire" was also used. This was emitted from portable fire extinguishers that throw out a flame that burns immediately and spontaneously. The waves of flame had an effective length and breadth of 20 meters. They had immediate and deadly effect and they drove back the enemy as a result of their development of heat. The translated orders for the use of these "flame projectors" said: "As they burn for a duration of a minute and a half to two minutes, and as they can be interrupted at will, it is recommended to make only isolated and brief jets of flame so as to be able to fight against several objectives with a single filling dose."

CHEMISTRY, ORGANIC. See CHEMISTRY, GENERAL PROGRESS OF, under section so entitled.

CHENG TSENG JU. Chinese admiral and administrator, assassinated Nov. 10, 1915. He was formerly commander of the Chinese navy, and during the revolution of 1913 was active against the revolutionists. He was a member of the Monarchist party. With his private secretary he was traveling to the Japanese Consulate at Shanghai to attend the coronation reception, when he was fired upon by two revolutionaries, and was fatally wounded.

CHESS. Activities in chess were naturally lessened during 1915 as a result of the European war, but several interesting matches were contested in the United States. José R. Capablanca was the central figure, perhaps. The Cuban champion, on February 22nd, in Brooklyn, played sixty-five games simultaneously against eighty-four opponents. This feat appeared to have been an inspiration to F. J. Marshall, the United States champion, for later in the year at Portland, Ore., he conducted games on ninety-two boards at one and the same time.

The most important tournament was held in Brooklyn from April 19th to May 10th, there being eight competitors, including Marshall and Capablanca. The latter won the first prize with thirteen victories and one defeat. Marshall finished second, winning twelve games and losing two. O. Chajes and A. Kupchik divided the third and fourth prizes, each capturing seven games and losing a like number.

The annual championship tourney of the New York State Chess Association resulted in a victory for A. Kupchik, who won all four of his games. The Brooklyn Chess Club won the second annual championship tourney of the Metropolitan Chess League, the individual honors going to Edward Lasker.

The twenty-third annual tournament of the American Quadrangular College League was won by Columbia with 10 victories and 2 defeats. Princeton was second, winning $5\frac{1}{2}$ games and losing $6\frac{1}{2}$, and Harvard third with a score of 5-7. Yale was last, losing $8\frac{1}{2}$ games and winning only $3\frac{1}{2}$. The Triangular College League contest resulted in a tie between Cornell and Pennsylvania, each team winning 12 games and losing 4. Brown failed to make a single score.

CHESTERTON, GILBERT KEITH. See LITERATURE, ENGLISH AND AMERICAN, *Poetry*.

CHEYNE, THOMAS KELLY. English Hebraist and Bible critic, died Feb. 16, 1915. He was born in London in 1841; educated at Worcester College, Oxford, and Göttingen; and in 1868 appointed a Fellow of Balliol College. His writings on subjects connected with the Bible began in that year, and continued practically until his death. From 1885, he was rector of Tending, Essex. Of the Old Testament Revision Company he was, in 1886, a member, and was Bampton lecturer in 1889, and American lecturer on the history of religions in 1897-98. In some respects, he was generally the most original writer among the English scholars of his time who devoted themselves to Old Testament studies. In recent years the special theories which he advocated failed to win acceptance. From 1885-1908 he was Oriel Professor of the Interpretation of Holy Scripture at Oxford, from which position ill health compelled him to resign, after which he was made professor emeritus. His published writings include: *Notes and Criticisms on the Hebrew Text of Isaiah* (1868); *Job and Solomon* (1887); *Foundations of Old Testament Criticism* (1894); *Jewish Religious Life after the Exile* (1898); *The Christian Use of the Psalms* (1899); *The Decline and Fall of the Kingdom of Judah* (1908); and *The Two Religions of Israel* (1910). He was an editor of the *Encyclopædia Biblica* and the *Critica Biblica*. He also contributed articles on religious subjects to the *Encyclopædia Britannica*. He received the honorary degrees of D.Litt. and D.D.

CHICAGO. See ILLINOIS.

CHICAGO, UNIVERSITY OF. An institution for higher education founded in Chicago, Ill., in 1893. The total enrollment in all departments in the autumn of 1915 was 4324. The faculty numbered 314, not including assistants and special lecturers. There were no notable changes in the faculty during the year, and no noteworthy benefactions were received. The productive funds at the end of the fiscal year amounted to \$19,446,184, and the income was \$1,094,253. The library contained at the same date 431,544 volumes.

CHICAGO, ROCK ISLAND, AND PACIFIC SITUATION. See RAILWAYS.

CHILD LABOR. While no striking events occurred in 1915 in the development of child labor restrictions the progress of recent years was maintained. In a number of States campaigns were carried on to improve child labor laws. Some of the improvements sought were the 14 year age limit; the eight-hour day; no night work under 16; regulation of street trades; issuance of work permits including proof of age; educational qualifications; and physical examinations. The regulation of home work in the large cities has come to be one of the most serious problems confronting those working for

improved conditions in Northern States. Thus in New York City alone there are 13,000 licensed tenement houses, each with from 1 to 40 families where children may be employed. It is almost impossible to prevent the employment of children even of ages 4 and 5 in home work. Here is the stronghold of the sweated trades. The solution advocated by many is the complete prohibition of home industries, thus forcing the trades into regular factories where inspection is easy and sanitary regulations can be enforced. In New York, also, the canning industry proves difficult to control. Out of 42 canning companies prosecuted by the State Labor Department, only 2 were convicted and these were fined only \$20; in such cases local sentiment plays a determining part. In North and South Carolina effort was made to secure a 14-year age limit and an eight-hour day, and an increase in educational requirements. In Illinois, California, Connecticut, Michigan, Minnesota, and Missouri child labor committees were at work to secure protection for young children from the moral dangers of street trades and to limit hours of work to eight per day. In Texas they sought to extend the present age limit to a number of occupations not now covered and also to limit the number of hours of work. In Utah and Maine they endeavored to extend the 14-year limit to occupations other than those in factories, and provide an eight-hour day and no night work. In Vermont the programme was to extend the 14-year limit to occupations not now considered and prohibit work under 16 in quarries and dangerous occupations. New York advocates worked for the eight-hour day. In Pennsylvania committees tried to abolish the exemption law allowing boys under 14 to work at night in glass factories, to regulate street trades, and to require physical examinations. The Oregon Board of Inspectors of Child Labor noted a decided change in the character of applications for permits during the past two years, due to three causes: (1) less effort to employ very young children in store, shop, or factory; (2) better coöperation of school authorities; (3) rulings of the Industrial Welfare Commission as to the minimum wage law. Many firms refuse to employ children under 16.

IN CONGRESS. For several years the passage of a national child labor law under the authority of Congress to regulate interstate and foreign commerce has been agitated. This resulted early in the year in the passage of the Palmer-Owen Bill by the House by a vote of 237 to 45. A long filibuster by Senator Overman of North Carolina prevented it from passing the Senate before adjournment in March. The bill aims to remove the disadvantages which the States not employing child labor are placed under, when competing with those which permit it, by forbidding the shipment in interstate commerce of the products of mills, factories, and canneries upon which children under 14 have been employed and of products of mines or quarries employing children under 16, or of any products on which children of 14 to 16 have worked at night or for more than eight hours a day. Among the Representatives voting against the bill by States were: Georgia, 9; North Carolina, 7; Mississippi, 6; Texas, 5; South Carolina, 5; Alabama, 3; all of these States are backward in child legislation.

LEGISLATION. The principal child labor enact-

ments of the year were the following. A bitter fight in the Alabama Legislature did not succeed in reducing the number of hours per week below 60, but a law was passed raising the age limit to 14 years after 1916 in all occupations, including street trades; provisions for enforcement were strengthened. California fixed 10 years as a minimum for street trades. Delaware established an unpaid labor commission to have charge of the women and child labor inspectors. Florida enacted a compulsory education law operative when adopted locally and strengthened the child labor law. Iowa limited the hours of children under 16 to eight per day and regulated street trades and messenger service. Maine passed a nine-hour day and 54-hour week law for children under 16, canneries being excepted from its operation. The Missouri Senate appointed a commission to draft a code of laws relating to children. Pennsylvania took a long step forward in child labor legislation by providing a 51-hour week, and a 14-year age limit. It was required that for children of ages 14 to 16 eight hours out of the 51 per week must be devoted to vocational training wherever facilities exist. An appropriation of \$1,000,000 was made to provide suitable schools. It was estimated that there were employed in Pennsylvania industries nearly 30,000 girls and over 46,000 boys of ages 14 to 16 or under. Many thousands of the boys had been employed as breaker boys at coal mines and as carriers in glass factories, but machines had already been installed in some places to do this work. In South Carolina and Texas compulsory school attendance laws were passed, the latter applying to ages up to 14, but the former being optional with each district as to age limit. A new Michigan law raised the age limit during school hours to 15 years, and prohibited child labor in certain occupations deemed inimical to health and morals. Utah forbade employment of children under the age of 14 in or about places where tobacco is sold or in any pool room. Wyoming forbade the employment of children under 18 years in breweries, saloons, or concert halls, or under 14 as messengers to such places; and established a nine-hour day for children under 14 years.

THE ELEVENTH ANNUAL CONFERENCE under the auspices of the National Child Labor Committee was held at San Francisco late in May. It was preceded by a joint conference of that Committee with the Southern California Child Labor Committee at Los Angeles. The session at San Francisco included an impressive pageant designed to impress upon the West the advantages of restricting child labor before it became a problem. A session was devoted to the proposed Federal children's charter (see below), and there was considerable discussion of a Federal child labor law. Other subjects included the struggle for better conditions in the South; street trades in California; and local needs of western communities.

FEDERAL CHARTER. At the 1914 and 1915 sessions of the National Child Labor Committee there was considerable discussion of a proposed national children's charter. This was first suggested by Roger N. Baldwin of St. Louis and strongly advocated by Edward N. Clopper. A committee, lead by C. C. Carstens of the Massachusetts Society for the Prevention of Cruelty to Children, was appointed to further the idea. It enlisted the support of numerous agencies,

including P. P. Claxton, Commissioner of Education, and Julia C. Lathrop of the Children's Bureau. The proposal is based on the belief that all child welfare activities should be co-ordinated under a systematic and well-reasoned plan. It is pointed out that multitudes of agencies are now in the field, each striving to promote its own activities, whereas with co-operation and a unified goal much more effective work could be done. As outlined by Mr. Claxton of the National Child Labor Committee this charter would include three principal sections. One of these dealing with the "preservation of life and health" would outline the principles to govern the segregation of the unfit; requirements of physical fitness for marriages; freedom of mothers from toil before and after confinement; responsibility for illegitimacy; birth registration; medical inspection; district nursing; pure food; and administration. Another section dealing with "protection from want, abuse and crime" would include "care of dependent, neglected and delinquent children"; protection from cruelty and premature toil; age of consent; juvenile courts; and "protection from demoralizing conditions." A final section dealing with "education and recreation" would cover school laws, industrial training, vocational guidance, social centres, parks and playgrounds, and libraries, and their administration. It was not contemplated that such a charter would include specific legislation but rather a collection of fundamental principles.

NEW YORK. The report of the Commissioner of Labor of New York for the year ending Sep. 30, 1914, gave the results of the efforts of the Division of Mercantile Establishments of the Bureau of Factory Inspection to determine the extent of child labor in mercantile establishments within the State. Nearly 25,000 inspections were made; 7500 children were found employed, of whom 2607 or 34.8 per cent were illegally employed. Of those illegally employed 1761 were of ages 14 to 16, but lacking certificates, while 846 were under 14 years of age. During the year 717 proceedings were begun for violations of the mercantile law, in 611 of which convictions were secured, while 51 were dismissed and 8 withdrawn. Of the 717 proceedings, 531 were for the illegal employment of children. The remainder related to the hours of women and minors, sanitation, and the day of rest provision.

SWITZERLAND. In a new Swiss law, the minimum age of employment was put at 14 years. In addition children under 16 were not to be employed where the normal hours of labor (10 hours per day) are exceeded, or nine hours on Saturdays and days preceding holidays. The Federal Council may further designate occupations at which persons under 16 may be employed. For children under 16 who are still attending to their religious instruction and schooling, the daily hours of attendance, together with their hours of labor in the factory, must not exceed the prescribed maximum of 10 hours.

GREAT BRITAIN. A conservative estimate of the boys and girls under 14 years of age employed for wages in the United Kingdom placed the number at 577,321. Of these 34,535 were half-timers, mostly in the cotton mill centres. About two-thirds of the total were boys. These figures revealed the great importance of the effort being made to raise the age limit, intro-

duce uniformity in legal requirements, and greatly extend the educational opportunities. At present there is a great lack of uniformity in child labor laws in England, Scotland, and Ireland; and this is aggravated by differences in educational facilities and requirements. This situation is primarily due to the fact that local authorities are given discretion in the enforcement of many features of child labor laws.

CHILDREN'S COURT. See **JUVENILE COURT.**

CHILDREN'S DISEASES. See **HYGIENE.**

CHILE. A republic south of Peru on the Pacific coast of South America. The capital is Santiago.

AREA AND POPULATION. Chile comprises 23 provinces and one territory, with an area officially estimated at 757,366 square kilometers (292,419 square miles). Its length from the Peruvian boundary to the southern limits of South America is about 4230 kilometers; its width, though varying, may be stated as approximately 285 kilometers. The census of Nov. 27, 1907, returned a population of 3,240,279; the estimated population at the end of 1912 was 3,505,317. The population of Santiago is estimated at upwards of 400,000, and of Valparaiso 200,000. Population of the larger cities (1907 census): Santiago, 332,724; Valparaiso, 162,447; Concepción, 55,330; Iquique, 40,171; Talca, 38,040; Chillán, 34,269; Antofagasta, 32,496. For all of these cities estimates have been published very much higher than the foregoing figures, but, while undoubtedly there has been a considerable increase since 1907, the estimates are probably excessive.

Marriages, as reported for 1912 and 1913 respectively, 21,258 and 21,341; births, 135,373 and 139,974; deaths, 103,905 and 111,225; excess of births, 31,468 and 28,719. Immigration in 1910, 2651; in 1911, 863; in 1912, 1839.

EDUCATION. Primary instruction is free, but not compulsory, and there is a low average attendance at the schools. In 1914 there were 3040 public primary schools, with 317,525 pupils, and 483 private primary schools, with 56,950 pupils; 86 public and 117 private secondary schools, with 25,217 and 17,181 students respectively; 12 public and 7 private higher grade schools, with 2457 and 828 students; 11 public and 10 private commercial schools, with 3728 and 1683 students; 7 public and 7 private special schools, with 1851 and 653 students; 16 public and 2 private normal schools, with 2641 and 723 students. In addition there are various technical and professional schools. There are two universities, which, in 1912, had 3217 students. The state religion is Roman Catholicism, but religious toleration prevails.

PRODUCTION. In the year 1911-12, the area under cultivation was 1,233,663 hectares, or 1.62 per cent of the area of the country; of the cultivated area, 47.4 per cent was planted to cereals. Some of the important yields are reported as follows: wheat, 3,262,000 metric tons in 1913-14, and 6,203,000 in 1914-15 (the average for the years 1905-6 to 1914-15 was about 5,375,000 metric tons); barley, 1,250,000 tons in 1913-14; oats, 644,890 tons in 1912-13; corn, 418,356 tons in 1912-13; potatoes, 2,627,954 tons in 1911-12, and 2,382,244 in 1912-13; wine, 1,964,380 hectolitres in 1911-12, and 2,262,853 in 1912-13.

Live stock (1913): horses, 457,840; asses, 32,892; mules, 38,193; cattle, 1,968,620; sheep, 4,602,317; goats, 299,381; swine, 221,384.

Chile owes its prosperity largely to its mineral resources. Coal is mined, though not in sufficient quantities for home consumption. The production of copper, for which the country was once famous, greatly declined, but in recent years the output has been increasing. The value of the gold and silver produced is comparatively small. But the leading mineral, and by far the country's greatest single source of wealth, is sodium nitrate, produced in the arid north, in Antofagasta and Tarapacá, and widely used as a fertilizer. The nitrate export in 1913 was about 60,000,000 metric quintals.

COMMERCE. Imports and exports have been valued as follows, in thousands of dollars:

	1910	1911	1912	1913	1914
Imports	108,582	127,381	122,076	120,274	99,828
Exports	120,022	123,884	139,878	144,658	109,382

Larger classified imports in 1914, in thousands of dollars: oils, varnishes, paints, and coal, 18,478; textiles, 17,838; mineral products, 15,973; vegetable products, 14,162; machinery, tools, apparatus, etc., 11,193; arms, ammunition, and explosives, 8639. Classified exports in 1914 were as follows, in thousands of dollars: mineral products, 93,208; animal products, 7966; vegetable products, 6082; various, 2124. Trade by principal countries, in thousands of dollars:

	Imports		Exports	
	1913	1913	1913	1913
United Kingdom	38,617	36,028	55,103	55,678
Germany	33,189	29,579	28,061	30,830
United States	16,800	20,090	24,515	30,419
France	7,261	6,623	7,669	8,858

COMMUNICATIONS. The following account of Chile's railway extension is taken from a monograph published in 1915 by the Pan-American Union:

"During 1913, there were added to the railway lines in operation in Chile 721 miles (1161 kilometers). Of these, 78 miles (126 kilometers) between Osorno and Puerto Montt were of 1.68 meter (standard) gauge; 273 miles (439 kilometers) between Arica and La Paz, of meter gauge; with other 7 miles (12 kilometers) at Arica; also 251 miles (404 kilometers) of meter gauge line on the North Longitudinal Railway, and 112 miles (180 kilometers) on the South Longitudinal Railway. The total of railways in operation at the end of 1912 was 3800 miles (6118 kilometers). At the end of 1913, therefore, the railways of Chile measured 4521 miles (7279 kilometers). There are other lines now under construction which will bring the railways to a total of 5684 miles (9148 kilometers), of which 3541 miles (5700 kilometers) are owned by the government and 2143 miles (3448 kilometers) belong to private concerns. These private lines are principally short railways running from coast ports into the interior, to carry nitrates and other mineral products for shipment abroad. There is, however, among them the Trans-Andean, via Juncal, which joins Valparaíso and Santiago (from Llai-Llai) with Mendoza, through connection having been inaugurated in 1910; and the international railway from Antofagasta into Bolivia to Oruro and La Paz, a distance of 719 miles (1157 kilometers). The great

trunk line of the government system is the Longitudinal, called the Central between Santiago and Valparaíso, 116 miles (187 kilometers), and between Santiago and Puerto Montt, 751 miles (1208 kilometers), the southern portion of this, from Osorno to Puerto Montt, having been opened to traffic in the early months of 1913. The Longitudinal Railway north of Valparaíso, at present open to Copiapó, was opened in November, 1913. Another important government railway, built with the coöperation of Bolivia, connects Arica with La Paz, a distance of 273 miles (440 kilometers), thus offering a short line between the highlands and the coast, somewhat paralleling a traditional trail of the aborigines. This road was opened to traffic during 1913. It is expected that passengers can be carried the entire distance in 15 hours, and suitable cars, with provisions to make rapid ascent and descent comfortable, are installed. The Chilean government is projecting the electrification of the section uniting Santiago and Valparaíso, the motive power from the river Aconcagua to be used, and as there are numerous rivers flowing westward from the Andes, power can with little difficulty be obtained for the electrification of the entire system south of Santiago."

In 1915 the Longitudinal Railway, which extends from extreme north to extreme south, a distance of 2132 miles, was completed for 1960 miles, and the line was in operation as far north as Pintados, Chile. A beginning was made with a connecting line from the main line to Iquique on the ocean, but work was stopped for insufficient available appropriation. It was proposed to spend \$134,000 to continue this work. The completion of the Iquique line would open up for development nitrate and other mineral deposits. The connection of the Longitudinal Railway with the ports of Antofagasta and Mejillones was postponed on account of the financial condition of the country, and the first section, which was to start from the main line at Baquedano Station, will probably be built when times improve. The South American Railway from Buenos Aires to Valparaíso was often interrupted by winter storms and was blocked in the mountains of Chile. This led to increased discussion of a second new line for Chile.

Telegraphs at the end of 1913: offices, 808, with 14,884 miles of line and 30,342 miles of wire. Telephone line, 25,430 miles; telephone wire, 36,291 miles. Post offices, 1114. A radio-telegraph system has been installed, with stations at Arica, Antofagasta, Coquimbo, Valparaíso, Talcahuano, Valdivia, Puerto Montt, Punta Arenas, and the Juan Fernández Islands.

FINANCE. The monetary unit is the peso, whose par value is equivalent to 18 pence, or about 36.5 cents. The paper peso fluctuates in value. Accounts of revenue and expenditure are kept partly in pesos gold and partly in pesos paper. Reduced to gold value, revenue and expenditure amounted to 221,332,000 and 235,127,000 pesos respectively in 1912, and 209,783,000 and 216,487,000 in 1913. Estimated expenditure for 1914, 252,568,000 pesos gold and 121,769,000 pesos paper. Customs revenue in 1914 amounted to 112,700,243 pesos gold, as compared with 158,070,367 in 1913. Customs at the three chief ports in 1913 and 1914 respectively were: Antofagasta, 38,221,531 and 30,268,639 pesos gold; Valparaíso, 38,936,176 and 25,853,856; Iquique,

33,755,714 and 25,229,727. On Jan. 1, 1914, the foreign debt was £33,912,340; internal debt, 155,822,535 pesos paper (equivalent to 32,920,839 pesos gold).

ARMY. Military service in Chile is compulsory under the terms of a law enacted Feb. 12, 1896, which requires men over 20 to receive military instruction. The military organization thus formed is called the National Guard, and the first draft under the law was made in 1901, when recruits were held for four and one-half months' service. This period obtained until 1903 when it was increased to six months, and in 1908 it was increased to one year, the recruits being called in two classes every six months. This division of recruits was being criticised by the military authorities who favored a single draft of the entire contingent, and at the same time there was a movement to increase the length of service to two years or at least to 18 months, and provide for a reserve. Various schemes have been suggested to ensure the registration of all men available for service, and it was proposed to deny the right of suffrage to all not exhibiting certificates of having performed military service.

NAVY. The Chilean navy includes two old battleships (*Capitán Prat* and *O'Higgins*), aggregating 15,600 tons; one armored cruiser (*Esmeralda*), 7000 tons; 4 protected cruisers, 14,500 tons; two torpedo cruisers, 1470 tons; and a number of smaller craft, including destroyers, torpedo boats, and two submarines.

GOVERNMENT. The executive authority is vested in a President, elected indirectly for five years and ineligible for the next succeeding term. He is assisted by a responsible ministry, and by a Council of State, which includes five members nominated by himself and six chosen by the Congress. The latter body consists of two houses, the Senate and the Chamber of Deputies. Senators, numbering 36, are elected for six years, and deputies, 118 in number, for three years. For the term ended Dec. 23, 1915, the President was Ramón Barros Luco, who was succeeded on that date by Juan Luis San Fuentes.

HISTORY. *Internal Conditions.* Chile was affected by the European war in much the same way as the other South American republics. Her credit in Europe was suspended, her export market was destroyed, and her imports had to be secured from new sources. The country suffered most through the destruction of the export market as it depended largely on its foreign sale of nitrate and guano. The failure of Europe to contract for the purchase of these products brought about a graver and more prolonged economic crisis than was experienced by the other nations of South America. The withdrawal of European support opened an opportunity for American enterprise and capital, and a close relationship between the financiers of the two countries was brought about by means of the Pan-American Congress held at Washington in May. Señor Don Juan Luis San Fuentes was elected President of the Republic in May, and his election was confirmed by the two houses of the Chilean Congress on September 17th.

Chilean Relations with Foreign Countries. One of the first official acts of the year on the part of the Chilean government was to order the German auxiliary cruiser *Sacramento* to leave the port of Valparaíso within 24 hours or be interned. Several days later the government

ordered the expulsion from Chile of two Peruvian politicians, ex-President Guillermo Billinghurst (see YEAR BOOK, 1914, PERU) and Dr. Augusto Durand, who had been exiled from Peru and were now proving troublesome to Chile.

On April 2nd a British squadron appeared in Chilean waters and opened fire on the German battleship *Dresden* which the Chilean government had ordered interned. The Governor of one of the islands adjacent to the mainland attempted to reach the British flagship to warn the commander that he was violating international law by firing within the three-mile mark in neutral waters, but the firing from the British fleet compelled him to turn back. The captain of the *Dresden*, rather than lose his ship to the British, set fire to the magazine and blew up the vessel. Chile immediately demanded an apology from Great Britain for this insult to her sovereignty, and Sir Edward Grey acknowledged that the British commander had erred in firing on the ship within the limit set by international law and apologized for the act. Germany became incensed at the action of the Chilean government in accepting this apology and a sharply worded note was sent to the South American republic acquainting the government with Germany's displeasure. Chile responded with a like note, demanded an apology from Germany for her inexcusable action of overstepping the bounds of international law, and for a time it appeared that Chile might be drawn into the conflict. The matter, however, was subsequently settled without recourse to arms. On May 25th Señor Alejandro Lira signed the ABC peace treaty at Buenos Aires, at the same time that the representatives of Brazil and Argentina affixed their signatures to the document which was aimed to bring about a lasting peace between the countries of Latin America. In April Chile decided to send representatives to the Pan-American Congress at Washington and appointed as delegates Luis Izquierdo, former minister of foreign affairs, Augusto Villanueva, Director-General of the Bank of Chile, and Luis Aldunate, a private banker. These delegates proposed, among other things, a direct line of steamships between the United States and Chile in order that closer trade relations between the two countries might be established.

CHINA. The Chinese Empire became the Chinese Republic Feb. 12, 1912, following a revolution ended by the abdication of the infant Emperor Pu-yi. The capital is Peking.

AREA AND POPULATION. The republic consists of China proper, or "the 18 provinces," Manchuria (3 provinces), Sinkiang province (including East Turkestan), and Mongolia and Tibet (dependencies). In recent years there have been several revolutionary movements of more or less magnitude in the dependencies, especially Outer Mongolia; and the autonomy of the latter was recognized by the Peking government in a convention with Russia signed in October, 1913. The population of China is not definitely known. For many years it was expressed by the round number 400,000,000. The estimates of the Maritime Customs for 1912 showed a total for China proper and Manchuria of 437,996,000. Various estimates and enumerations have been made under governmental authority, but with so complete an ignorance of statistical method that they command little confidence. There is reason to believe, however,

that the number of inhabitants is fairly represented by the returns of the 1910 census, based on an enumeration of households. This enumeration tends to confirm the opinion held by some authorities that the traditional 400,000,000 and the estimates of the Maritime Customs are greatly excessive. Moreover, it seems not improbable that the population has increased very slowly if at all. The census returns shown below by provinces are exclusive of children under six years old; these are estimated at 9,000,000. In the case of Szechwan, a figure reported by the viceroy, and regarded as being more nearly accurate than the census figure, has been substituted for the census figure.

	<i>Sq. miles</i>	<i>Pop. 1910</i>	<i>Capital</i>

* Not including children under six years. † Including Koko-Nor and Tsaidam. ‡ Estimate.

Estimates of urban populations vary widely. According to the 1910 census, Peking had 821,000 inhabitants, this figure including an estimate of the number of children under six years. The population of some of the larger treaty ports has been estimated as follows: Canton, 900,000; Tientsin, 800,000; Shanghai, 651,000; Chungking, 631,700; Foochow, 624,000; Hankow, 596,000; Hangchow, 594,000; Soochow, 500,000; Ningpo, 455,000; Nanking, 269,000; Changsha, 250,000; Chinkiang, 184,000; Amoy, 114,000; Wenchow, 100,000; Shasi, 100,000; Wuhu, 89,000; Nanning, 87,600; Kharbin, 81,400; Swatow, 70,000; Kongmoon, 62,000; Ichang, 55,000. The estimated number of foreigners resident in China in 1913 was 163,827, of whom 80,219 were Japanese, 56,765 Russians, 8966 British, 5340 Americans, 3486 Portuguese, 2949 Germans, 2292 French, and 3810 others.

EDUCATION AND RELIGION. The traditional system of examination in the Chinese classics as the only means to state employment was abolished by the Imperial edict of Sept. 3, 1905.

The government undertook the gradual introduction of Occidental learning, and progress has been rapid. Old style schools still exist in considerable numbers, but the new schools are constantly increasing, and the new education is already widespread. A Board of Education under the central government at Peking has in charge university instruction as well as that of technical and preparatory colleges and higher normal schools. Lower normal schools, middle schools, and primary schools are controlled by the provincial governments. The Imperial University, at Peking, and the university at Tientsin have a European and Japanese staff in addition to Chinese professors. There is a tendency to displace foreign teachers by Chinese educated abroad. There are numerous mission schools and colleges, both Protestant and Roman Catholic. The estimated number of educational institutions of all kinds in China is about 58,000, with an enrollment of some 1,600,000 pupils and students. Translations of foreign books are in increasing demand. There are over 300 daily, weekly, or monthly papers and magazines published in the country.

The religions acknowledged by the Chinese are Confucianism, Buddhism, and Taoism. Under the republic no ecclesiastical hierarchy is maintained, but Confucianism is regarded as the basis of ethical teaching in the system of national education. Mohammedans appear to be fairly numerous, especially in Kansu, Sinkiang, Chihli, and Yunnan. Their number is not known even approximately; formerly it was supposed to be about 30,000,000, but recent estimates place it between 5,000,000 and 10,000,000. At the end of 1912, European Roman Catholic priests are reported to have numbered 1423, and Roman Catholic native Christians 1,531,216. Foreign members of Protestant missions in 1913 are reported at 5449, including 1060 ordained ministers; the number of Protestant native Christians was stated at 356,209.

INDUSTRIES. China, though rich in minerals, is a distinctly agricultural country. The principal crops, in the north, are wheat, barley, corn, millet, and other cereals, and beans and peas; in the south, rice, sugar, indigo, and cotton are grown. Tea is an important product in the south and west, as also are silk cocoons, which to some extent are produced in all the provinces. It has been estimated that about 27 per cent of the world's silk supply comes from China. The tea export in 1913 amounted to 192,181,200 pounds. In the same year, the soy bean, which is the chief crop of Manchuria, was exported to the amount of 620,000 tons. Considerable attention is given to horticulture and the cultivation of many kinds of fruit. Opium was formerly produced in large quantities, but the output, as well as the importation from India, has been greatly restricted, pursuant to government decree and to the Anglo-Chinese treaty of May 8, 1911. The government of India agreed that the export of opium from India to China should cease before 1917, conditionally upon the establishment of proof of the nonexistence of poppy cultivation throughout the republic by that date. No Indian opium may be brought into any Chinese province which has succeeded in suppressing cultivation. At the end of 1914, the only provinces into which the entry of opium was permitted were Yunnan, Kwangtung, Kweichow, Kiangsi, Kiangsu,

Shensi, and Kansu. On the same date, the stock of Indian opium in China was 8100 chests (486 tons). The net import of Indian opium in 1913 is reported at 1088 tons, or 227 tons less than in 1912.

China's progress in mining, as compared with its great mineral resources, is insignificant. Although many mining concessions have been granted to foreigners, the opposition of provincial and other authorities has hindered development. The coal deposits of the country, which are worked to some extent, are known to be among the richest in the world. Of the other minerals worked, the more important are tin (in Yunnan), iron, antimony, lead, zinc, copper, and salt. The tin export in 1913 amounted to 8321 tons.

The leading manufactures are cotton, silk, and woolen goods. Forty-five mills, with 1,250,000 spindles, were reported in operation at the end of 1914. There is some manufacture of iron and steel, especially at Hanyang, near Hankow. A number of modern flour and rice mills have been established.

COMMERCE. In the following table are shown the value in haikwan taels of imports and exports general, and also of the special trade (that is, imports for consumption and exports of Chinese produce). The figures do not include specie and bullion. The average value of the haikwan tael was 65 cents in 1911, 74 cents in 1912, and 73 cents in 1913.

	1911	1912	1913
Imports, gen....	482,576,127	485,726,080	586,290,431
Imports, spec....	471,503,943	473,097,081	570,162,557
Exports, gen....	388,410,350	383,149,432	419,433,420
Exports, spec....	377,388,166	370,520,403	403,805,546

For 1913 the principal imports and the principal exports of Chinese produce are given below, in thousands of haikwan taels:

Imports	1000 tls.	Exports	1000 tls.
Cotton fabrics	109,882	Raw silk, waste, etc.	83,156
Cotton yarns	72,537	Beans and bean	
Opium	41,023	Tea	48,458
Sugar	36,464	Silk mfrs.	33,937
Petroleum	25,408	Hides and skins	21,719
Rice	18,884	Cotton	19,789
Dyes, etc.	17,511	Oils	16,587
Tobacco	16,891	Sesame	12,609
Iron	18,852	Tin	12,372
Fish	12,975	Wheat	10,917
Flour	10,301	Live animals	9,514
Coal	9,492	Wool	6,781
Machinery	7,980	Coal	6,656
Leather	7,179	Straw goods	6,593
Paper	7,169	Peanuts	5,074
Arms, etc.	6,915	Silks	5,038
Copper	6,788	Meats	4,435
Timber	6,687	Matting	3,990
Matches	6,341	Medicines, etc.	3,888
Woolen fabrics	4,879	Timber	3,789
Tin	4,875	Fireworks	3,810
Medicines, etc.	4,027	Paper	3,200
		Fruits	3,142

The tea export amounted to 248,757,333 pounds in 1895, 182,573,064 in 1905, 197,559,867 in 1912, and 191,181,200 in 1913. In the latter year 120,795,600 pounds were exported to Russia, 19,178,000 to the United States, 13,783,600 to Hongkong, and 10,144,800 to the United Kingdom. The trade with Hongkong is principally transit, the imports being chiefly of British origin, while the exports are reshipped to various countries. Trade by countries has been as follows, in thousands of haikwan taels:

	Imports		Exports	
	1912	1913	1912	1913
Hongkong	147,801	171,686	108,384	117,129
Japan	91,017	119,847	45,262	65,544
United Kingdom	74,856	96,911	15,900	16,346
British India	46,646	48,292	7,573	6,190
United States	86,198	85,427	85,050	87,650
Germany	21,180	28,302	14,389	17,025
Russia	21,232	22,153	55,197	44,921
Belgium	8,751	15,831	6,555	6,546
Straits Settlements	8,605	8,985	6,339	7,558
Du. E. Indies	6,048	6,837	1,613	2,605
Macao	6,408	6,596	4,573	4,952
France	2,982	5,300	88,809	40,750
Indo-China	8,319	4,782	1,497	1,887
Austria-Hungary	2,275	4,123	1,873	1,550
Corea	8,155	3,527	5,448	6,813

Italy	486	664	10,848	8,318
Other Europe	915	2,052	1,081	968
Other	1,859	2,286	6,739	7,205
Total	485,726	586,290	370,520	403,806
Reexportation	12,629	16,128		
Total net	478,097	570,163	370,520	403,806

SHIPPING. In the direct foreign trade, vessels entered and cleared at the ports in 1913 were as follows:

	Entered		Cleared	
	No.	Tons	No.	Tons
British	4,971	5,127,578	5,095	5,288,289
Japanese	2,880	3,882,664	2,829	3,839,438
Chinese	27,008	2,386,806	26,409	2,322,227
German	691	1,406,086	711	1,481,836
French	801	469,450	297	463,675
Russian	520	422,274	518	422,089
American	232	269,091	221	245,704
Norwegian	141	167,196	134	155,212
Ttl. incl. other	37,307	14,518,224	36,774	14,632,647
Total, 1912	34,543	12,847,881	34,267	13,228,601

COMMUNICATIONS. Throughout the greater part of China proper there are numerous roads, which, though mostly in poor condition, carry a large internal trade. They are supplemented by many canals and navigable rivers, which, so far as commerce is concerned, are probably more important than the roads. The length of railway open to traffic at the beginning of 1914 was reported at 5960 miles (including the Manchurian railways); under construction, 2273 miles. Of the railway in operation, about 1300 miles had been built by British capital. An imperial edict of May 9, 1911, providing for the reversion to imperial control of all trunk railway lines contributed largely to the unrest that culminated in the rebellion of the following October.

The Canton-Hankow Railway, at the end of 1914, was open as far as Wu Shek, 121 miles from the Canton terminus, and in 1915 work was under way on the next section of 19 miles to Shiukuan. The total length of the section to be built by the Canton Company was 214 miles, which would take the line to Ichang, just across the Hunan frontier. The receipts were in excess of expenses and upkeep, and were expected to increase considerably with the extension of the railway to Shiukuan. The Canton-Samshui Railway, 32 miles long, had a good year in 1914, in spite of damage to the roadbed by flood. The Chekiang Railway, which became known as the Shanghai-Hangchow-Ningpo Railway, was formally taken over by the Chinese government and placed under the

control of the Shanghai-Nanking-Hangchow Railway management. It was found that as a result of Chinese construction and management the whole of the rolling stock would have to be replaced and the roadbed relaid. One of the unsolved problems was bridging the Chientang River near Fuyang, but the shifting bottom of the river presents a well-nigh insuperable obstacle. With the delivery of material held up at Tsingtau during the siege, progress was being made with the construction of the bridge near Paikuan. It was believed that the line beyond Hangchow eventually would run via Chiakou and Fuyang to Chuchi, Shaohsing, and Paikuan. Another branch would probably extend from Fuyang to Lanchi, the junction from Chinhua and Wenchow in one direction, and Ch'uchow, Changshan, Yushan, and the Ning Hsiang Railway (Nanking-Hunan), in the other.

Telegraphic communication exists between the principal cities and with adjacent countries. Length of line at the end of 1914, 36,339; of wire, 49,963; offices, 561. There are wireless telegraph stations at Peking, Shanghai, Nanking, Canton, Hankow, and Kalgan. Postal service is maintained in China proper, Manchuria, and Sinkiang. Post offices in 1913, 7808.

FINANCE. Statements of revenue and expenditure are not reported as in western countries. Recent calculations, based upon imperfect data, placed the revenue at 297,000,000 taels, and the expenditure at 576,000,000 taels. Revenue derived from the foreign trade is collected by the Chinese Maritime Customs, originally organized by the late Sir Robert Hart, and under the control of a British inspector-general (F. A. Aglan in 1915). Receipts from Maritime Customs and from opium likin respectively have been: in 1910, 32,732,856 and 2,839,023 haikwan taels; in 1912, 35,526,495 and 4,424,117; in 1913, 40,150,720 and 3,819,133.

The foreign debt, at the end of 1914, is reported to amount to about £173,494,000, including the Boxer indemnity of £67,500,000, and certain treasury bills, etc., approximating £4,000,000.

The haikwan, or Maritime Customs, tael fluctuates with the price of silver. Its average value was about 79 cents in 1907, 65.5 cents in 1908, 63.4 cents in 1909, 66 cents in 1910, 65 cents in 1911, 74 cents in 1912, and 73 cents in 1913; at the end of 1913, it was valued at 72.3 cents, and at the end of 1914 at 66.4 cents.

ARMY. While an elaborate scheme of organization had been prepared for the Chinese army, yet the realization in 1915, due largely to internal political conditions, was far from satisfactory. The actual organization was based on the Imperial edict of 1902, but its execution had been under the direction of the President, Yuan Shi Kai. There was a standing army in which the length of service was three years with the colors, three years in the first reserve, and four years in the second line, which paid about \$3 per month, or better wages than the average laborer. A reservist was paid monthly 75 cents, but has to appear personally and receipt for the same, so it is possible to keep up the organization. The Chinese non-commissioned officers are derived either from the ranks or from special schools, and are required to serve one year longer than the privates. The cadets

receive a preliminary schooling, and then serve with the colors for six months, after which they are two years in a military academy and are commissioned as officers. A War College is designed for exceptional men to give further and more advanced professional training. It was reported in 1915 that Yuan Shi Kai had put 36 divisions into existence, each made up of about 8800 effective troops, and 2000 supply and administrative troops, on the basis of an organization that provided that each division would be increased to about 17,000 and 3000 men, respectively, in time of war. In July, 1914, the army was said to total 130,000 infantry, 12,000 cavalry, 17,000 artillery, with 800 guns, 900 engineers, and 8000 train. In the middle of 1915 100,000 troops of this standing army were said to be in the vicinity of Peking. The infantry was variously supplied with arms, Mauser rifles of two models, a Japanese Murata, and a Mannlicher rifle, predominating. The machine guns are Vickers-Maxim, but the artillery had many old style Krupp pieces, 164 modern field guns and 250 mountain guns, in addition to a varied assortment from different gun makers of the world. Foreign critics believed that the Chinese army might have furnished a substantial resistance to an invasion by Japan, but in its organization and equipment the force was not to be compared with the troops of the neighboring empire.

NAVY. Various plans for reorganization and development of the navy have been officially proposed and discussed in recent years, but little of importance has been effected. Dockyards are inadequate, no proper naval bases exist, and the small and partly antiquated fleet is quite devoid of uniformity. Aside from small craft, the only serviceable vessels are several protected cruisers. Four of them (one of 4300 tons and three of about 3000 tons each) were built in 1897 and 1898. The fifth, the *Ying Swei*, of 2400 tons, was launched at Barrow in July, 1911, and the sixth, the *Chao Ho*, of 2400 tons, at Elswick in the following October; both were completed in 1912, in which year a seventh cruiser of about the same displacement was launched. Besides old craft, there are several destroyers, river gunboats, sea-going gunboats, and torpedo boats.

GOVERNMENT. The Manchu dynasty, which came into power in China, ended with the abdication of the Emperor Pu-yi (reign title Haun-tung), Feb. 12, 1912. Pu-yi was born Feb. 11, 1906, and his uncle, Prince Chun, had acted as regent. The republic established upon the Emperor's abdication was recognized by the United States May 2, 1913, and by other powers Oct. 6, 1913. Yuan Shi Kai was declared provisional president Feb. 15, 1912, and was elected (Oct. 6, 1913), and inaugurated (October 10), as the first constitutional president for the term 1913-18. A new constitution was promulgated May 1, 1914, and an edict was promulgated on December 29 extending the president's term to 10 years, with provision that a two-thirds vote of the Senate might continue it indefinitely. See also section *History*, below.

HISTORY

THE JAPANESE DEMANDS. One of the most significant features of the year was the inability of the Chinese government to resist Japan's insistent demands for special privileges in

China. In view of their extraordinary importance, the Japanese demands are here reproduced in full, as they were contained in the document handed to President Yuan Shi-Kai on Jan. 18, 1915, by the Japanese minister at Peking, M. Hioki.

GROUP I. The Japanese Government and the Chinese Government, being desirous to maintain the general peace in the Far East and to strengthen the relations of amity and good neighbourhood existing between the two countries, agree to the following articles:—(1) The Chinese Government engages to give full assent to all matters that the Japanese Government may hereafter agree with the German Government respecting the disposition of all the rights, interests and concessions, which, in virtue of treaties or otherwise, Germany possesses *vis-à-vis* China in relation to the Province of Shantung. (2) The Chinese Government engages that, within the Province of Shantung or along its coast, no territory or island will be ceded or leased to any other Power, under any pretext whatever. (3) The Chinese Government agrees to Japan's building a railway connecting Chefoo or Lungkow with the Kiaochow-Tsinan Railway. (4) The Chinese Government engages to open of its own accord, as soon as possible, certain important cities and towns in the Province of Shantung for residence and commerce of foreigners. The places to be so opened shall be decided upon in a separate agreement.

GROUP II. The Japanese Government and the Chinese Government, in view of the fact that the Chinese Government has always recognized the predominant position of Japan in South Manchuria and Eastern Inner Mongolia, agree to the following articles:—(1) The two contracting parties mutually agree that the term of the lease of Port Arthur and Dairen and the term respecting the South Manchuria Railway and the Antung-Mukden Railway shall be extended to a further period of 99 years respectively. (2) Japanese subjects shall be permitted in South Manchuria and Eastern Inner Mongolia to lease or own land required either for erecting buildings for various commercial and industrial purposes or for farming. (3) Japanese subjects shall have the right to enter, reside and travel in South Manchuria and Eastern Inner Mongolia, and to carry on business of various kinds,—commercial, industrial, and otherwise. (4) The Chinese Government grants to Japanese subjects the right of mining in South Manchuria and Eastern Inner Mongolia. As regards the mines to be worked, they shall be decided upon in a separate agreement. (5) The Chinese Government agrees that the consent of the Japanese Government shall be obtained in advance (a) whenever it is proposed to grant to other nationals the right of constructing a railway or to obtain from other nationals the supply of funds for constructing a railway in South Manchuria and Eastern Mongolia; and (b) whenever a loan is to be made to any other Power, under security of the taxes of South Manchuria and Eastern Inner Mongolia. (6) The Chinese Government engages that whenever the Chinese Government needs the service of financial or military advisers or instructors in South Manchuria or in Eastern Inner Mongolia, Japan shall be first consulted. (7) The Chinese Government agrees that the control and management of the Kirin-Chanchun Railway shall be handed over to Japan for a term of 99 years dating from the signing of this Treaty.

GROUP III. The Japanese Government and the Chinese Government, having regard for the close relations existing between Japanese capitals and the Han-Yeh-Ping Company and desiring to promote the common interests of the two nations, agree to the following articles:—(1) The two contracting parties mutually agree that when the opportune moment arrives the Han-Yeh-Ping Company shall be made a joint concern of the two nations, and that, without the consent of the Japanese Government, the Chinese Government shall not dispose of or permit the Company to dispose of any right or property of the Company. (2) The Chinese Government engages that, as a necessary measure for the protection of the vested interests of Japanese capitalists, no mines in the neighborhood of those owned by the Han-Yeh-Ping Company shall be permitted, without the consent of the said Company, to be worked by anyone other than the said Company; and further that whenever it is proposed to take any other measure which may likely affect the interests of the said Company directly or indirectly, the consent of the said Company shall first be obtained.

GROUP IV. The Japanese Government and the Chinese Government, with the object of effectively preserving the territorial integrity of China, agree to the following article:—The Chinese Government engages not to cede or lease to any other Power any harbor or bay on or any island along the coast of China.

GROUP V. (1) The Chinese Government to engage influential Japanese as political, financial and military advisers. (2) The Chinese Government to grant the Japanese hospitals, temples and schools in the interior of China the right to own land. (3) In the face of many police disputes which have hitherto arisen between Japan and China, causing no little annoyance, the police in localities (in China) where such arrangements are necessary to be placed under joint Japanese and Chinese administration, or Japanese to be employed in police offices in such localities, so as to help at the same time in the improvement of the Chinese Public Service. (4) China to obtain from Japan the supply of a certain quantity of arms, or to establish an arsenal in China under joint Japanese and Chinese management and to be supplied with experts and materials from Japan. (5) In order to promote the development of the Nanchang-Kiukiang Railway, with which Japanese capitalists are so closely identified, and with due regard to the negotiations which have for years been pending between Japan and China in relation to the railway question in South China, China to agree to give Japan the right of constructing a railway to connect Wuchang with the Nanchang-Kiukiang line, and also the railways between Nanchang and Hangchow and between Nanchang and Chaochow. (6) In view of the relations between the Province of Fukien and Formosa and of the agreement respecting the non-alienation of that province, Japan to be consulted first whenever foreign capital is needed in connection with the railways, mines, and harbor works (including dockyards) in the Province of Fukien. (7) China to grant to Japanese subjects the right of religious propaganda in China.

In short, Group I of the Japanese demands would secure Japan's predominance in the Shantung peninsula, formerly under German influence, without committing Japan to the surrender of Kiaochow, which she had conquered from the Germans (see YEAR BOOK, 1914). Group II would assure to Japan valuable mining, commercial, and railway rights in the regions of South Manchuria and Eastern Inner Mongolia. Group III would safeguard the interests of Japanese capitalists in the Han-Yeh-Ping Mining Company. Group IV would exclude other powers from the Chinese coast. Group V would not only secure Japanese financial control of the Chinese province of Fukien, just opposite Formosa, and a railway concession in Southern China, but would also give Japan a very considerable influence over the general military, police, and financial affairs of the Chinese Empire.

CHINO-JAPANESE NEGOTIATIONS. Following the presentation of the Japanese demands there ensued a protracted series of conferences between the Japanese minister to China and the Chinese minister of foreign affairs. At the conference of February 12, the Chinese government announced its readiness to accept the first Group of the Japanese demands, relating to Shantung, provided that Japan would unconditionally return Kiaochow to China, indemnify Chinese citizens who had suffered by the Japanese operations against Tsingtao, withdraw the Japanese forces remaining outside of the leased territory, and give China a voice when the peace negotiations between Japan and Germany should take place. As regards Group II, subsequent negotiations made it clear that China was willing to grant Japan special privileges in the provinces of South Manchuria and Eastern Inner Mongolia, if Chinese sovereignty over those regions were specifically recognized, and if the second, third, and fourth clauses of the Group were considerably modified, so that more towns would be thrown open to international trade, but complete extraterritorial rights would not be extended to Japanese nationals. The Chinese government was willing to make voluntary assurances, but not to alien-

ate its sovereignty by giving irrevocable assent to Group IV, excluding other Powers from concessions on the Chinese coast. The second clause of Group III seemed altogether too extravagant. And some of the clauses of Group V were incompatible with the sovereignty of China. In response to the representations of the Chinese minister, Japan revised her demands and submitted a new draft, containing 24 clauses, much more moderate in tone than the original document, and omitting the demand for partial control of the police. According to the Japanese version of the negotiations, Japan at this time renewed her offer to restore Kiao-chow to China if the demands were accepted. To this revised list, the Chinese government replied with a counter-project. This failed to meet the wishes of the Japanese government in three respects: (1) China still insisted upon the unconditional return of Kiao-chow, with damages for Chinese losses, and representation in the diplomatic negotiations with Germany in respect of the leased territory; (2) China introduced a number of minor amendments in the clauses of Group II relating to Japanese privileges in Manchuria and Mongolia; (3) China refused to bind herself formally by the clauses of Group V pertaining to railway concessions in South China, the employment of Japanese advisers, the right of Japanese subjects to buy or lease land in China for the erection of schools and hospitals, and the purchase of arms from Japan. The clause of Group V relating to Fukien had already been agreed to, while the clause relating to the right of religious propaganda had been deferred and the provision for joint police administration withdrawn by Japan. The reason for China's obstinacy in refusing the fifth Group was explained in a memorandum accompanying the Chinese counter-project as arising from the fact that demands in the fifth Group "all infringe China's sovereignty, the treaty rights of other Powers, or the principle of equal opportunity." Without further parley, Japan now delivered an ultimatum, May 7, allowing the Chinese government two days to accept Groups I, II, III, IV, and the Fukien article of Group V. In event of a refusal, the Japanese government would take such action as it deemed necessary. It is important to note that the conditional offer to restore Kiao-chow to China was repeated, and that the major demands of Group V, which would have made China subservient to Japan in political and military as well as in economic affairs, were now dropped. Thoroughly intimidated by the vague threat of the Japanese ultimatum, the Chinese government on May 8 accepted Groups I, II, III, IV, and the Fukien article of Group V, completely complying with the ultimatum. The articles thus agreed upon were incorporated in two treaties and a series of notes, dated May 25, at Peking—a treaty respecting the province of Shantung (permitting Japan to agree with Germany upon the transfer of German privileges in Shantung to Japan); an exchange of notes whereby China promised never to alienate any territory on or near the coast of Shantung; a treaty respecting South Manchuria and Eastern Inner Mongolia (giving Japanese nationals a free hand in the economic exploitation of those regions, and extending the leases of Port Arthur and Dairen, the South Manchurian Rail-

way, and the Antung-Mukden Railway, until 1997, 1997, 2002, and 2007 A.D., respectively); a series of notes defining the status of Japanese subjects in the above-mentioned provinces in respect of Chinese courts and taxes, specifying the districts in which Japanese capitalists would be allowed to select coal, iron, and gold mines for exploitation, and promising to give Japanese capital and Japanese advisers the preference in those provinces; an exchange of notes safeguarding the control of the Han-Yeh-Ping Company by Japanese capitalists; an exchange of notes declaring that China had no intention to permit any foreign power to construct a shipyard, coaling station, naval base, or other military establishment, on the coast of Fukien, or to construct such establishments herself with foreign capital; and, finally, an exchange of notes whereby Japan promised with certain provisos to return the leased territory of Kiao-chow to China, "if, upon the conclusion of the present war, the Japanese government should be given an absolutely free disposal of the leased territory of Kiao-chow Bay."

POLITICAL AFFAIRS. Late in January the Far Eastern Bureau made the announcement that Lu Cheng-Hsiang, China's ablest diplomat, had been appointed minister of foreign affairs to succeed Sun Pao-Chi who became head of the Audit Department of the government. In April President Yuan Shi Kai accused Dr. Sun Yat-sen of plotting a new revolution against the government. Dr. Sun Yat-sen had been residing in Tokio since his last unsuccessful effort to depose Yuan Shi Kai. It was rumored unofficially that Japan was backing the revolutionary efforts of the former president of the Chinese Republic. Dr. Frank J. Goodnow, president of Johns Hopkins University, was appointed constitutional adviser to the government by President Yuan early in June. Two weeks later the president of the republic unearthed an amount of peculation and petty graft among government officials, with the result that Chang-Hu, vice-minister of finance, and Yeh Kung-Cho, vice high minister of communications, were dismissed. Chang-Hu, who had been acting as a director of the Salt Gabelle, one of the government's principal sources of revenue, was sentenced to banishment in Sze Chuen Province.

RESTORATION OF THE MONARCHY. The trend of the Chinese government to revert to absolutism in the hands of Yuan Shi Kai became more pronounced in the summer of 1915. Rumors were frequent that Yuan Shi Kai was contemplating a *coup d'état* for the restoration of the Empire, with himself as Emperor. The progress of the monarchist reaction, it was alleged, caused the resignation of Vice-President Li Yuan Heng, September 2nd. A little later, the Society for the Preservation of Peace presented a petition to the Advisory Council calling for the reestablishment of the monarchy. The first week in October the Council of State, acting as a provisional parliament, enacted a bill convoking a citizen's representative congress to decide the question whether or not the republic should be abandoned. Accordingly elections were held in November. So overwhelming a majority of the popular vote was cast in favor of monarchist candidates that the Council of State in December urged Yuan Shi Kai to declare himself emperor. The President

hesitated. He had repeatedly declared himself in favor of maintaining the republic, and he was reported to have received advice from Japan, Russia, and Great Britain pointing out that it would be wise to avoid any radical alteration of the Chinese constitution, lest disturbances should occur. The warning against a restoration of the monarchy was repeated December 15th by the diplomatic representatives of Japan and the Quadruple Entente in Peking. Nevertheless, Yuan announced that it was no longer possible to disregard the will of the nation, as expressed by the Council of State and as manifested by the elections; therefore he considered it his duty to consent to the restoration of the Empire. The formal changes that would be necessary in the administrative machinery, and the coronation ceremony, however, were to be delayed at least until the close of the year 1915, in accordance with the assurances which had been given to the Entente Powers. It was to be expected that the restoration of the Empire would encounter the most stubborn opposition from the convinced republican leaders who had fought for the establishment of the republic in 1911-12 (see *YEAR BOOKS* 1911, 1912, CHINA). A republican insurrection was confidently predicted by many students of Chinese politics. Reports of a mutiny on board the Chinese cruiser *Chao-ho* in Shanghai harbor, seemed at first to fulfill the prophecy, but presently it appeared that the "mutiny" was merely the escapade of a handful of revolutionaries who seized the ship and opened fire on neighboring vessels. The "mutiny" was easily suppressed and seemed to be quickly forgotten. More serious, however, were the reports which began to appear at the close of December, alleging that two of the southernmost provinces, Yunnan and Kwangsi, had seceded and were in the hands of the rebel General Tsai-To, who had played a conspicuous part in the revolutionary movement of 1911.

RELATIONS WITH THE UNITED STATES. Chinese relations with the United States were improved greatly during the year. The European war took away China's market for products, with the result that she appealed to the United States in many different connections. The first important effect took place on January 13th, when China shipped \$1,700,000 in gold to San Francisco. This money was not necessarily for goods purchased in America, but to represent a debit balance on the transactions in which China was interested in different parts of the world. As the gold would ordinarily have been sent to London, the shipment to San Francisco, and thence to New York, was a noteworthy event in the development of the United States as a financial centre. This shipment was followed later by two of smaller amount. American consuls in China at various times reported increases in the sale of American-made goods in different Chinese provinces. A most important development in trade relations with the United States was the decision to send a trade commission to that country. Many of the highest officials and most prominent Chinese merchants were formed as a result of the commission; they arrived in the United States in May, and spent two months inspecting industrial plants all over the country. Nearly 200 plants were visited during this period. Much closer relations between Chinese and American

merchants were formed as a result of the commission's visit. In many plants which were visited the Chinese commissioners were so favorably impressed that they gave immediate orders for purchases.

The United States took little action in regard to the demands which Japan made on China in January. On February 27th two unofficial representatives of the United States in Japan—Dr. Sidney Gulick and Prof. Shailer Matthews—visited Count Okuma, Japanese Premier, and were informed by the latter that Japan had no intentions of trespassing on China's rights or the privileges of other nations in the country. Late in March President Wilson branded as false the Japanese rumor that the United States approved of the demands on China. As no answer had as yet been received from Japan, it was impossible, said the President, either to approve or disapprove of the demands. A few days later the United States government protested to Japan against her interference in the selection of foreign advisers, the purchase of war munitions, and the contraction of foreign loans. On May 6th the government issued a statement to the effect that it had been advised that Japan had no intention of interfering with the political independence or territorial integrity of China or with the "open-door" policy to which all of the leading nations were committed. Furthermore, the United States government had not been asked to surrender any of its treaty rights in China, and did not intend to do so if asked. One week after the treaty had been agreed upon by the two Powers, the United States, as a precautionary measure, sent each a note to the effect that it could not agree to any action which might impair the treaty obligations contracted by the United States and China, the "open-door" policy, or the integrity of the Chinese Republic. On July 26th, Dr. V. K. Wellington Koo was appointed Chinese minister to Mexico, Peru, and Cuba. Dr. Koo, after graduating from Columbia University, had been selected by President Yuan Shi Kai as official secretary, and had been of valuable assistance to the Chinese foreign minister in the conduct of the negotiations with Japan in the spring of 1915. Three months after his appointment as minister to Mexico, Peru, and Cuba had been announced, Dr. Koo was named as Chinese minister to the United States, succeeding Kai Fu Shah, who had been recalled. Because of his fluent command of the English language, and his American education, Dr. Koo was particularly well qualified to represent the Chinese government at Washington. In August the Chinese government sent a naval commission to the United States, headed by Admiral Wei Han, chief of Chinese naval construction, for the purpose of studying American naval equipment, navy yards, and submarines. A newspaper report, probably unfounded, later announced that the commission had arranged to purchase from an American firm no fewer than 100 submarines, at a total cost of \$75,000,000, for the enlargement of the Chinese navy.

CHOLERA. An epidemic of this disease occurred in Manila in 1914, a record of which was published in April, 1915. Two features of the treatment are worth recording. In all there were 1100 cases, including suspects and carriers; 330 were genuine cases of cholera, 170

not cholera, and 570 were carriers. The total number of deaths with and without medical treatment was 190. The percentage of recoveries among the 330 genuine cases treated at San Lazaro was 72.5. It was observed that nearly all patients slept with their eyes partly open, the eye-balls rotated upward, the lids parted, and two-thirds of the pupil frequently visible. This symptom was invariably present among the children, and was considered of diagnostic importance. In the treatment, a solution of 0.45 per cent sodium chloride, 0.25 per cent sodium bicarbonate, was injected into a vein at the rate of about 1 litre in 45 minutes. The injection acted as a mild hypnotic and made good the loss of fluid through the watery bowel movements. Another measure which appeared to give equally good results was continuous proctoclysis. The slow, steady introduction of warm saline fluid into the rectum caused the pulse to return to normal in from 8 to 10 hours. Proctoclysis was particularly serviceable in cases of *cholera sicca*. These patients generally died, in spite of intravenous saline injections when used alone; but when the intestine was emptied by a copious enema, and this followed by proctoclysis, signs of recovery often began to appear in about an hour. Under the treatment outlined, the application of artificial heat, the administration of sedatives and cardiac stimulants were rarely found necessary.

In controlling the epidemic the Bureau of Health confined its efforts largely to detecting and isolating vibrio carriers. All the members of the family of a cholera suspect were immediately examined, and those found to harbor cholera vibrios were promptly quarantined. In all, 570 persons were isolated. They were confined to the hospital until at least two negative stools were obtained on separate days. The carriers received saline cathartics, followed by salol.

Active immunization against cholera was undertaken by the bacteriologic institution at Budapest, which distributed free serum for the purpose. The serum is described as being prepared from a fresh culture of the cholera bacillus, a bacterial emulsion being made with physiologic salt solution in the proportion of 2 mg. of bacteria to 1 c.c. of salt solution. The fluid is exposed to a temperature of 132.8°F. for one hour in order to kill the bacteria, and 0.5 per cent phenol is added for preservation. The substance is really not a serum, but a vaccine. Those exposed to infection, such as hospital attendants, are advised to have two injections five days apart, which confers immunity lasting from a few months to a year. A reaction of greater or lesser intensity is observed during 48 hours following the injection. See also INSECTS, PROPAGATION OF DISEASE BY, and VITAL STATISTICS.

CHORAL SOCIETIES. See MUSIC.

CHOSEN. See KOREA.

CHRISTIAN ENDEAVOR, UNITED SOCIETY OF. The 27th international convention of the society was held in Chicago, July 7-12, 1915. The convention was one of the most successful and significant held in its history. Thursday, July 8, was State day, and was observed by speeches from representatives of the work in the different States. Special attention was given during the convention to the subjects of tem-

perance, missions, and internationalism. Denominational rallies were held in the leading churches in the various denominations in Chicago. The society numbers 4,000,000 members, 75,000 different societies, and includes 80 denominations.

CHRISTIANS. The total number of communicants in this denomination in 1914 was 113,887. There were 1360 churches, and 1086 ministers. The administrative body of the church is the American Christian Convention, which is made up mostly of delegates from the conferences. This, of course, has the general supervision of the work of the denomination. Several schools and colleges are maintained, the most important of which are the Union Christian College in Indiana, Defiance College in Ohio, Starkey Seminary in New York, Elon College and Franklinton Christian College (colored) in North Carolina, Palmer College and Weaubleau College in Missouri, and Jireh College in Wyoming. It has also a theological school, the Christian Biblical Institute, in Ohio. Missions are conducted in Japan, Porto Rico, continental United States, and Canada.

CHRISTIAN SCIENCE. During the year 1915 the administration of the trust created by the terms of the will of Mary Baker Eddy was continued. In 1914 the trustees, Archibald McLellan, Allison V. Stewart, John V. Dittmore, Adam H. Dickey, and James A. Neal—directors of the First Church of Christ Scientist in Boston—and Josiah E. Fernald, of Concord, N. H., announced their plan for using the income of Mary Baker Eddy's estate for the purpose stated in her will. This purpose was the "more effectually promoting and extending the religion of Christian Science as taught by her." The plan, as announced at the annual meeting of the Mother Church on June 8, 1914, was as follows: 1. To contribute toward the expense of lectures given by Christian Science organizations outside the United States, Canada, and Great Britain. 2. To contribute toward the ever-increasing distribution of authorized literature throughout the world. 3. To contribute toward the establishment and maintenance of circulating or lending libraries of authorized Christian Science literature in connection with the denomination's churches, societies, reading-rooms, and Sunday schools. 4. To assist, in so far as is possible and practicable, in building church edifices.

The plan thus formulated was carried into effect in 1914 and with increased vigor and efficiency in 1915. A large sum of money, amounting to about \$250,000 thus far, was distributed for the benefit of Christian Scientists and others affected by the war in Europe. In response to an appeal from the Mother Church, nearly all branch churches and societies, as well as individuals, contributed liberally to the war relief fund. An official representative of Christian Science from Boston visited the countries at war, found where the needs were greatest, and appointed representatives to distribute funds. The distribution of literature was continued; and up to June 1, 1915, the number of magazines, journals, pamphlets, and other pieces of literature in five languages (English, French, German, Swedish, and Norwegian) amounted to over 600,000.

The Board of Directors of the Mother Church decided in June, 1915, to accept the plans for a memorial to Mary Baker Eddy in Mount Auburn

Cemetery in Cambridge, Mass. The designer of the memorial is Egerton Swartout, of New York City. The plot is 80 feet square, and the memorial consists of a circular open colonnade of eight columns, resting upon a stylobate of three steps, surrounded on the front by a circular platform slightly above the natural grade, from which platform a double flight of steps leads to a lower platform at a lake's edge. The scheme is a screen of columns open to the sky, enclosing a flower-grown circle. The material is white granite, the inscription of white bronze, and the detail is entirely floral in form and free in treatment, the wild rose and the morning-glory being used as the main motives. The extreme width of the memorial is 80 feet, colonnade 18 feet in diameter, and columns 15 feet in height.

During 1915 the Christian Science movement, in number of adherents, number of churches, and in every respect, showed a steady and progressive development.

CITY PLANNING. Just how the events of the year 1915 on the battlefields of Europe will ultimately affect city planning in England or on the Continent it would be vain to attempt to predict. For the time both the planning and execution of all sorts of municipal improvements except those connected with military operations seemed to have come nearly to a stop. In Canada there was a similar pause, but the work of Thomas Adams, City Planning Adviser to the Canadian Conservation Commission, was continued. In the United States there was also a check to city planning, but projects already under execution, like the group plan of the public buildings at Cleveland, Ohio, went forward.

At the seventh National Conference on City Planning, held at Detroit in June, 1915, Flavel Shurtleff, secretary, called attention to the fact that the dominant note in American city planning literature prior to 1909, was æsthetic, while at the first Conference, held that same year, the "æsthetic note" was "almost absent," stress having been "put on planning as an economic remedy for municipal waste and for social misery." At subsequent conferences the economic and social sides of the subject were also dominant. In the 1915 Conference considerable attention was paid to the architectural phases of city planning, but the one subject which was given most attention at the Detroit meeting was land subdivision, or the

size and arrangement of blocks and lots. Papers and discussions on this subject occupy about 90 pages of the report of the 1915 Conference. A notable feature of the discussion on subdivision was the part taken in it by real estate men.

Another feature of the 1915 Conference was a report of a committee on the Constitution and Powers of a City Planning Authority, consisting of a summary of replies to a *questionnaire*. A single city planning authority or office for each city was favored by 79 of 80 replies. Of 76 replies to a second question, 45 favored making the creation of a city planning authority mandatory, and 2 favored it if the authority had advisory powers only; 25 favored the permissive method, and 4 believed in this method at first, with the mandatory method eventually. A third question dealt with the powers that should be given a city planning authority to correlate particular improvements with the comprehensive city plan. Of 74 who replied, 9 favored advisory powers; 7 an absolute veto; 28 a veto that could be overridden by the city council; and 30 some combination of the methods named. A great diversity of opinion was shown as to the proper constitution of a city planning authority. A total of 71 opinions were expressed. Of these 28 favored a special unpaid commission of citizens, not city officials; 3 were for a committee of the council; 2 advocated an ex-officio commission of department heads or engineers; 2 favored the city engineer; and 36 favored a combination of the four methods. As to the advisability of vesting local authorities with powers like those in the English Town Planning and Housing Act of 1909, 55 answered yes, and 4 no. State legislation compelling or permitting city planning commissions has been enacted in Massachusetts, Connecticut, New York, New Jersey, Pennsylvania, Maryland, Ohio, Wisconsin, Nebraska, and California, and about 100 commissions have been appointed. The first of these commissions was created in Hartford, Conn., in 1908.

Excess condemnation, or the taking of more land than is needed for a public improvement with power to combine, subdivide, and sell the excess, is considered by many as essential to city planning, both for the purpose of controlling abutting or facing property, and of enabling the city to reap a part of the enhancement of the value of property surrounding the improvement, thus reducing the cost of the improvement. The apparent success of this practice abroad led to its advocacy in the United States. Legislation authorizing excess condemnation was enacted by Massachusetts and Ohio in 1904, Virginia in 1906, Connecticut and Pennsylvania in 1907, and Maryland in 1908. A Philadelphia purchase under the 1907 act was declared unconstitutional by the State Supreme Court the same year. Constitutional sanction for excess condemnation was secured in Massachusetts in 1911, Wisconsin and Ohio in 1912, and New York in 1913. It was defeated by popular vote in New Jersey and California in October, 1915. To the middle of the year no use of this constitutional power had been reported, but New York City had just perfected a plan for putting excess condemnation into effect.

Courses in city planning are now offered at Harvard University, the University of Illinois,

and perhaps elsewhere in the United States, and at the University of Liverpool in England. During the year members of the classes in civic design at the University of Illinois, working under the direction of Prof. Charles M. Robinson, made, and the university published, *A Study in City Planning in Champaign and Urbana*. The National Conference on City Planning (Boston, Mass.) established a small *City Plan Quarterly* in 1915. Recent British books are Patrick Geddes, *Cities in Evolution* (London); Henry Aldridge, *The Case for Town Planning* (National Town Planning and Housing Council). At the close of the year a new American book was announced: Nolen, *City Planning* (New York). See MUNICIPAL GOVERNMENT, under *Model City Charter*.

CIVIC ASSOCIATION, AMERICAN. No annual meeting of this association was held during 1915, but it was postponed until the early part of January, 1916. The work of the association during the year progressed as usual, the war having had but little influence upon it. The general headquarters of the association are at Washington. The officers are: J. Horace McFarland, president; William B. Howland, treasurer; Richard B. Watrous, secretary.

CIVIC CENTRES. See CITY PLANNING.

CIVIC FEDERATION, NATIONAL. The usual annual meeting was not held in 1915, partly owing to the war, and partly to the unusual number of topics which demanded attention. The meeting annually held in December of each year was therefore postponed for over a month, and no annual report was made during 1915. Among the subjects which were vigorously discussed during the year especial emphasis was given to the legal and moral obligations resting upon foreign-born citizens of the United States—those who have become, and those who have taken steps to become, naturalized citizens. Attention was also given to the duties and prospects of those who are engaged in labor and business in the United States, but who do not intend to take out citizens' papers. The remarkable check imposed by the war upon immigration led to a careful inquiry concerning its economic results, its effect upon the wage-earner, upon industry, and upon the body politic. Special committees were engaged to prepare reports upon the profit-sharing plans now in operation in the United States, as well as a description of the abandoned ones and the causes of their failure. The investigation was thorough, covering the different methods employed in industrial enterprises—manufacturing plants, mercantile houses, public service corporations, and financial institutions.

The remarkable condition of affairs in Europe, where governments have been compelled by the war to take over more and more of private industry, has had a profound effect upon thought in this country, and during the year much attention was given by members of the federation to the question as to how far government here could enter into private industry. The crux of the inquiry was whether the change in Europe was permanent, or only tolerated as a military necessity.

The industrial economics department of the federation made a survey during the year of the social and industrial changes which have taken place in the United States during the last generation. The object of the survey was

to summarize the changes in American national life, and to gather together the essential material from which to judge where there has been improvement, where loss, and how far, on the whole, gains and losses balance or outweigh one another. More particularly the survey tried to find out (1) how wages, hours of labor, and the physical conditions of the factory and the home compare with those of 30 years ago; (2) what effect the work of the American Federation of Labor, the Railway Brotherhoods, and the social reform organizations, and the legislation secured by them has had upon conditions in factories, mercantile establishments, mines, bakeries, tenement houses, and sweat shops; (3) whether child labor has increased or diminished in recent decades; (4) what effect State legislation has had upon age limits, hours worked, and opportunity for education; (5) the effect of the adoption of the principle that industry shall bear the burden of industrial accidents; (6) what has been done by employers for the physical well-being of wage-earners; (7) whether the farmer is holding to the ownership of his farm, lapsing into tenancy, or sinking under mortgage debt; (8) the housing conditions, educational opportunities, public health, business ethics, political ethics.

The officers of the federation are: president, Seth Low; vice-presidents, Samuel Gompers and Benjamin Ide Wheeler; treasurer, Isaac N. Seligman; chairman of the executive council, Ralph M. Easley.

CIVIL SERVICE. FEDERAL CIVIL SERVICE. The total positions held in the civil service of the United States on June 30, 1915, were 454,116. Of these 9692 were presidential appointments. In addition to this total, 28,605 were employed on the Panama Canal, making a grand total of 482,721. There were employed in the City of Washington 33,464 persons in the civil service, and outside, 420,652. There were no noteworthy developments in the history of the Federal Civil Service during 1915. The National Civil Service Reform League began an energetic campaign with the special purpose of securing legislation providing for the competitive classification of first, second, and third class postmasters. Improvement in the administration of the foreign service was promised by the passage of the so-called Stone-Flood Bill in the 63rd Congress. This bill provided for the classification of the diplomatic secretaries and consular officers in the grades, and the assignments of the members of this service from these grades. The President was also authorized to transfer these officers from post to post as the interests of the service might require. The Secretary of State was required to keep a service record of the officers of the foreign service, and to report to the President the names of those who especially deserved promotion.

THE STATE CIVIL SERVICE. The State Legislatures did not enact many important civil service measures in 1915. There appeared to be in general a reaction against social legislation, and this was accompanied by a similar reaction in regard to civil service laws. The Legislature of Colorado enacted a new law, the effect of which will be largely to defeat the purpose of the merit system. In Wisconsin an effort was made to weaken the merit system by the passage of a bill permitting the certification

of an entire eligible list, instead of three names. The civil service law was also weakened by the Ohio Legislature. In California the Legislature approved a bill which would take from the Civil Service Commission its power of investigation. This was vetoed by Governor Johnson. In contrast to these efforts to destroy the value of civil service measures, the Legislature of Kansas passed a civil service bill applying to the State service. Similar measures were passed in New Jersey and in Louisiana.

CIVIL SERVICE COMMISSION. See CIVIL SERVICE.

CIVIL SERVICE REFORM LEAGUE, NATIONAL. The 35th annual meeting of the league was held at Philadelphia, Dec. 2, 1915, the address being delivered by the president, Richard H. Dana, who reviewed the league's progress during the year. The council reported the steady growth of public sentiment in favor of the merit and efficiency system, but sharply criticized the Republican legislatures in Connecticut and Colorado for attacks made upon the system in those States, while it praised the Republican legislature in New Jersey for upholding the system. In several other State legislatures, including Wisconsin, Ohio, and California, attempts prejudicial to civil service reform were made, but were not successful. In Kansas, Louisiana, and New York, substantial progress was made; but in Chicago a bitter struggle during six months went on between civil service reform supporters and the Mayor, with the result of substantial injury to the cause by the capture of a large number of offices for the benefit of the Mayor's following. In New York State Governor Whitman secured the resignations of the Sulzer-Glynn Commissioners, and vetoed bills which sought to weaken the effect of civil service reform, and the commission appointed by the Governor did much to restore the merit system and its personnel in the State. In New York City, the commission appointed by Mayor Mitchell made notable advances in methods of civil service examinations, filling by competitive non-assembled examinations high-grade positions to which hitherto the competitive classification had not applied. The governing board of the league resolved to start an active campaign to secure the competitive classification of all postmasters. The officers of the league are: president, Richard Henry Dana; chairman of the council, Robert D. Jenks; secretary, George T. Keyes; assistant secretary, Harry W. Marsh; treasurer, A. S. Frissell.

CLARK, CHARLES HEBER. American writer, died Aug. 10, 1915. He was better known under the pen name of "Max Adeler." Born in Berlin, Md., in 1841, he was educated at Georgetown, D. C.; entered journalism in 1865; and engaged in writing for many years. He was at one time one of the most widely read humorous story-writers in the United States, but his later years were devoted chiefly to economic and industrial subjects. He was editor of the *Textile World*, and was engaged in manufacturing at Conshohocken, Pa. His writings include: *Out of the Hurly Burly*; *Captain Bullett*; *In Happy Hallow*; and *The Quakers*.

CLARK COLLEGE. An institution for higher education at Worcester, Mass. Although the same buildings are used for both Clark Uni-

versity and Clark College, the latter is entirely independent in administration and endowment. There were in the different departments of the institution in the autumn of 1915, 171 students, and a faculty numbering 27. Clark College is non-sectarian. The productive funds of the college amounted to \$1,400,000 and the income to about \$70,000. The library contains 75,000 volumes. The president of the college is Edmund C. Sanford, Ph.D.

CLARK UNIVERSITY. An institution for graduate study, founded at Worcester, Mass., in 1889. The total enrollment in all departments in the autumn of 1915 was 107. The faculty numbered 21. There were no notable changes in the membership of the faculty during the year, and no noteworthy benefactions were received. The productive funds of the university amounted to about \$2,400,000, and of the college to \$1,400,000. The library contains about 65,000 volumes. The president of the university is G. Stanley Hall, Ph.D., LL.D.

CLASSICAL LITERATURE AND SCHOLARSHIP. See PHILOLOGY, CLASSICAL.

CLAY WORKING INDUSTRIES. The clay working industries were not especially prosperous in 1914. The total value of all clay productions marketed was \$164,986,983, compared with a value of \$181,289,132 in 1913, a decrease of nearly 9 per cent. This decrease was due chiefly to the general condition of business. Of the two great divisions of the industry—brick and tile, and pottery—the former showed the larger decrease. The decrease in the brick and tile industry was 9½ per cent, and in the pottery industry about 7 per cent. The most prominent features in the industry were the continued large decrease in the production and value of common brick in the regions supplying the New York City markets, and the large increase in the value of clay pottery in Iowa, Minnesota, Oklahoma, Maine, and West Virginia. There was a decrease in 37 States in the development of clay pottery in 1914. Ohio has been the leading State in clay potteries since statistics were first compiled in 1894; Pennsylvania ranks second; New Jersey third; Illinois fourth; New York fifth; and Indiana sixth. Common brick is the most widely distributed. Illinois was the largest producer. Next to the common brick, front or face brick has the widest distribution. The value of all the States in pottery in 1914 was \$35,395,161. Every product, except red earthenware, decreased in value in 1914. The number of States producing pottery of some variety was 37. There are several States in which pottery of higher grades are made. White ware is made in eight States; china in four; and porcelain and electrical supplies in nine States. Ohio is the leading State in pottery, Pennsylvania second, and Missouri third. New Jersey is the leading china-producing State, with New York second, Pennsylvania third, and West Virginia next. Ohio produces every variety of pottery, except china. The principal pottery production in New Jersey is sanitary ware. The pottery imports in the United States in 1914 were valued at \$8,349,442. The exports were valued at \$3,578,005.

CLOUSTON, SIR THOMAS SMITH. English physician, died April 20, 1915. He was born in Orkney in 1840; educated in Aberdeen and Edinburgh universities; and became successively physician for the Cumberland and Westmoreland Asylum, physician superintendent of the Royal Asylum, Morningside, Edinburgh, and lecturer on mental diseases at Edinburgh University. He received the degree of LL.D. from Aberdeen and Edinburgh universities, and was knighted in 1911. From 1902-03 he was president of the Royal College of Surgeons, Edinburgh. His published writings include: *Clinical Lectures on Mental Diseases; The Hygiene of the Mind; and Unsoundness of Mind*.

CLUB BUILDINGS. See ARCHITECTURE.

COAGULEN CIBA. This is a hemostatic drug said to be an extract prepared from blood-platelets and to contain a thromboplastic substance, mixed with lactose, 1 gm. representing 20 gm. of dried blood. Coagulen is said to act as a hemostatic by increasing the natural process of clotting. In 5 per cent solution the substance may be used by local application or by injection into the muscles or veins. Coagulen ciba occurs as a yellowish, granular powder, having a sweet taste and faint odor. It is very soluble in water and such a solution may be boiled for two or three minutes without destroying its therapeutic activity.

COAL. The coal mining industry in 1915 presented a marked contrast to that of the preceding year. In 1913 the production of both anthracite and bituminous coal reached its highest points as recorded; in 1914 the output fell below that of 1913, and even of 1912. The production in these years was phenomenal and followed the reaction of the panic years of 1907 and 1908. The decrease in production in 1914 was due partly to the depression of the iron trade in the early part of the year. After the close of the first quarter of 1914, the call for bituminous coal decreased, and during the last quarter the conditions in many of the coal mining regions were little short of demoralized. The European war does not seem to have exerted a marked effect upon the production of coal in the United States in 1914. Certain Rocky Mountain fields suffered a decrease as a result of the curtailment of copper smelting after the war began. There were two important strikes during the year, one in Colorado, and one in Ohio. But the effect of these was not so serious as it would have been in a year when the demand for coal was strong.

In view of the general depression, and the lighter demand for coal, the firmness of prices in 1914 was noticeable.

The total production of coal in 1914 was 513,525,477 short tons, valued at \$681,490,643. The decrease from 1913 in the production amounted to 569,960,219 tons, or nearly 10 per cent. Of the total amount of the coal produced, 81,900,631 long tons were Pennsylvania anthracite, and 422,703,970 short tons were bituminous coal and lignite. The production of anthracite in 1913 was 81,718,680 long tons, while the production of bituminous in the same year was 478,435,297 short tons. The decreased production in anthracite

was due particularly to mild weather during the winter months in the area where it is used almost exclusively, and to the decreased exportation to Canada. The decrease in the demand for bituminous coal was distributed generally all over the country, with the exception of seven States where the production in 1914 was greater than in 1913. Two of these States indicated, South Dakota and North Dakota, produced lignite only, and had relatively small outputs. The increase in New Mexico was due to ability to supply markets ordinarily furnished by coal from Colorado, which, in 1914, suffered from a serious strike. The other States which showed increase were West Virginia, Kentucky, Michigan, and Oregon. The greatest decrease was in Pennsylvania, which fell off almost 26,000,000 tons, or nearly 15 per cent. In Ohio the decrease was nearly 50 per cent, compared with 1912. This is accounted for by strike conditions.

Several changes took place in the rank of coal producing States in 1914, the most notable of which was the supplanting of Ohio by Kentucky as fourth in quantity of output. From 1896 to 1913 Ohio occupied fourth place. The change is due to decreased production on account of strike conditions in this State. Indiana succeeded Alabama in sixth place, and Wyoming in eleventh place. Washington dropped from seventeenth to nineteenth in output, and from twelfth to fifteenth in value. The value of the coal in Ohio maintained fourth place, and Alabama dropped from sixth to seventh place in quantity of output, and was sixth in point of value. Additional information in regard to the production of coal in individual States may be found in the paragraph, *Mineral Production*, under the separate States. The tables below give the relative rank of the coal producing States in 1913-14 with the quantity and value of production.

Rank	State	1913 Production	
		Quantity (short tons)	Per- centage of total produc- tion.
1	Pennsylvania:		
	Anthracite	91,524,922	16.1

In regard to the number of men employed in the coal mines, the year 1914 surpassed all others. The number employed in anthracite and bituminous mines for the first time exceeded a quarter of a million. The total number of men employed in 1914 was 703,185; of this number 179,679 were engaged in the production of anthracite, and 523,506 in the bituminous and lignite mines.

LABOR TROUBLES. The biennial wage scale agreements in the bituminous organized coal mining districts of the United States, made in 1912, expired April 1, 1914, and as usual, pending settlement of the new agreement, there were a large number of men on strike. The most serious conflict was in Ohio, where a total number of 40,577 men were affected by the strike for an average of 159 days. In other States the wage agreements were effected without serious loss of time. The coal strike was in effect from September, 1913, in Colorado, until December, 1914. Labor troubles in the anthracite regions were numerous, but not long continued.

ACCIDENTS. The record of fatal accidents in the coal mines in 1914 showed a decrease from 2785 in 1913, to 2454 in 1914. Of the total number of fatal accidents in 1914, 595 occurred in the anthracite mines of Pennsylvania, and 1879 in the bituminous mines and lignite mines. As usual, the most prolific cause of deaths was the falling of roof and coal, which killed 1131 miners—46 per cent of the total number of deaths. The death rate per thousand employees in the anthracite region was 3.31 in 1914, against 3.52 in 1913. In the bituminous regions the death rate per thousand was 3.19 in 1914, against 3.79 in 1913, and the death rate for the entire country in 1914 was 3.22, against 3.73 in 1913.

CONSUMPTION. More than 95 per cent of the anthracite and bituminous coal produced in the United States is consumed in the country, although efforts to build up an export trade, particularly with high grade bituminous coal, have resulted in a considerable expansion of business done with foreign countries. The quantity of coal consumed in the manufacture of coke in 1914 was 34,791,656 short tons, compared with 49,458,320 tons in 1913.

EXPORTS AND IMPORTS. The European war, which for the time being has eliminated Germany as an exporter of coal, was expected so to re-

strict Great Britain's coal exports, that the United States would be able to capture a large number of the foreign markets and build up a permanent export trade in coal. Beginning in August, when war was declared, exports of coal in the Atlantic seaboard increased, but not to the extent anticipated, for the reason that up to the end of 1914 England had not found it necessary to restrict the export of coal, and for the further reason that a large number of foreign coal users were temporarily out of the market. Shipments to South America and other countries increased about 40 per cent in 1914, but the exports to Canada, which is the largest user of United States coal, fell off 30 per cent. The result was that the total exports of anthracite and bituminous coal from the United States decreased from 22,141,143 long tons in 1913, to 17,632,094 in 1914. The imports of both anthracite and bituminous coal were unimportant.

WORLD'S PRODUCTION. The following figures were furnished to the United States Geological Survey by William G. Gray, statistician of the American Iron and Steel Institute, and Prof. G. A. Roush, editor of *Mineral Industry*.

THE WORLD'S PRODUCTION OF COAL, IN SHORT TONS

Country	1913	1914
United States	569,960,219	518,525,477
Great Britain	321,922,180	297,698,617
Germany	305,714,664	270,595,952

COAST AND GEODETIC SURVEY. See EXPLORATION, *Oceanic*.

COAST DEFENSES. See MILITARY PROGRESS.

COCHIN-CHINA. A French colony, the southernmost division of French Indo-China (q.v.). Saigon is the capital, with about 68,000 inhabitants; Cholon has about 182,000. River and coast fishing, stock raising, and agriculture are carried on.

COCKROACHES. See INSECTS, PROPAGATION OF DISEASE BY.

COCKRELL, FRANCIS MARION. United States Senator from Missouri, died Dec. 13, 1915. He was born in Johnson Co., Mo., in 1834; was educated in the public schools; studied law; and was practicing in this profession at the outbreak of the Civil War, when he entered the Confederate army. He rose from the rank of captain to that of brigadier-general. Several times he was wounded during the war. At the siege of Vicksburg he was in command of one of the forts, and he commanded the Confederate forces at the battle of Long Jack, Mo., which, for the numbers engaged, was one of the bloodiest conflicts of the war. After the war he returned to practice law, and in 1875 was elected to the Senate, succeeding Carl Schurz, and served five terms, or until 1905. General Cockrell was defeated for the Senate at the time of the Republican landslide, which resulted in the election of Roosevelt. A Republican Legislature was elected in Missouri. Many prominent men were candidates for Senator, and Elihu Root, then Secretary of State, suggested that General Cockrell should be continued in the office by the Legislature. This the Republican members of the Legislature refused to do, and President Roosevelt appointed him a member of the Interstate Commerce Commission. He was one of the most useful members of the Senate during his term of office, and for a time a chairman of the Committee on Appropriations.

CODMAN, ROBERT. American bishop of the Protestant Episcopal Church, died Oct. 7, 1915. He was born in Boston in 1859; graduated from Harvard in 1882; three years later from the Harvard Law School; and in 1886 was admitted to the bar. For several years he was associated with his father in the practice of law, but after the death of his brother Archibald, an Episcopal clergyman, he decided to take up the work of a missionary priest. He became a student at the General Theological Seminary, and, following three years' study, was ordained to the priesthood. He acted as assistant in Philadelphia, and was then chosen rector of All Souls Church in Ashmark, Mass. He afterwards became rector of St. John's Church in Roxbury. He was elected Bishop of Maine in 1899, and was ordained in the following year.

COFFEE. See AGRICULTURE.

COFFIN, SELDEN JENNINGS. American astronomer and educator, died March 15, 1915. He was born in Ogdensburg, N. Y., in 1838; graduated from Lafayette College in 1858, and from the Princeton Theological Seminary in 1864. He was ordained to the ministry, but did not, however, preach. In 1864 he was appointed adjunct professor of mathematics, a professor in 1876, registrar in 1886, and professor of astronomy since 1873, at Lafayette College. He was the author of *Conic Sections* (1878); *Record of the Men of Lafayette* (1891). He revised the astronomy of Olmsted, and other astronomical works.

COINAGE. See COINS, VALUE OF.

COINS, VALUE OF. The following table gives

the value, as proclaimed by the United States Secretary of the Treasury, on Oct. 1, 1915, of foreign coins in the currency of the United States.

Of the total amount of coke made in 1914, 23,335,971 tons were beehived or oven coke, and 11,219,943 tons were by-product or retort coke. The decline in general resulted from the de-

Country	Standard	Monetary Unit	Value in U.S. Gold Dollar	Remarks. (a)
Argentina	Gold	Peso	\$0.9648	Currency: depreciated paper, convertible at 44 per cent of face value.
Austria-Hung'y	Gold	Crown	.2026	
Belgium	Gold	Franc	.1980	Member of Latin Union; gold is the actual standard.
Bolivia	Gold	Boliviano	.3898	12 1/4 bolivianos equal 1 pound sterling.
Brazil	Gold	Milreis	.5462	Currency: Government paper. Exchange rate about \$0.25 to the milreis.
British Colonies in Australia and Africa	Gold	Pound sterling	4.8665	
Canada	Gold	Dollar	1.0000	
Central American States:				
Brit. Honduras	Gold	Dollar	1.0000	
Costa Rica	Gold	Colon	.4658	
Guatemala	Silver	Peso	.3587	Currency: inconvertible paper, exchange rate 40 pesos = \$1.00.
Honduras	Silver	Peso	.8587	Currency: bank notes.
Nicaragua	Gold	Cordoba	1.0000	
Salvador	Silver	Peso	.8587	Currency: convertible into silver on demand.
Chile	Gold	Peso	.8650	Currency: inconvertible paper; exchange rate approximately, \$0.14.
China	Silver	Tael	{ Shanghai .5296 Haikwan .5899 Canton .5780	
Colombia	Gold	Dollar	1.0000	Currency: inconvertible paper; exchange rate, approximately, \$105 paper to \$1 gold.
Cuba	Gold	Peso	1.0000	
Denmark	Gold	Crown	.2680	
Ecuador	Gold	Sucre	.4867	
Egypt	Gold	Pound (100 piasters)	4.9481	The actual standard is the British pound sterling, which is legal tender for 97 1/2 piasters.
Finland	Gold	Mark	.1980	
France	Gold	Franc	.1980	Member of Latin Union; gold is the actual standard.
Germany	Gold	Mark	.2882	
Great Britain	Gold	Pound sterling	4.8665	
Greece	Gold	Drachma	.1930	Member of Latin Union; gold is the actual standard.
Haiti	Gold	Gourde	.9647	Currency: inconvertible paper; exchange rate, approximately, \$0.16.
India	Gold	Rupce	.8244	(15 rupees equal 1 pound sterling.)
Italy	Gold	Lira	.1930	Member of Latin Union; gold is the actual standard.
Japan	Gold	Yen	.4935	
Liberia	Gold	Dollar	1.0000	Currency: depreciated silver token coins; customs duties are collected in gold.
Mexico	Gold	Peso	.4985	Mexican exchange rate fluctuating, approximately, \$0.15.
Netherlands	Gold	Florin	.4020	
Newfoundland	Gold	Dollar	1.0139	
Norway	Gold	Crown	.2680	
Panama	Gold	Balboa	1.0000	
Paraguay	Silver	Peso	.3587	Currency: depreciated paper; exchange rate 1.550 per cent.
Persia	Gold	Kran	.1700	This is the value of the gold kran. Currency is silver circulating above its metallic value; exchange value of silver kran, approximately, \$0.0875.
Pern	Gold	Libra	4.8665	
Philippine Islands	Gold	Peso	.5000	
Portugal	Gold	Escudo	1.0806	Currency: inconvertible paper; exchange rate, approximately, \$0.70 1/2.
Rumania	Gold	Leu	.1930	
Russia	Gold	Ruble	.5146	
San Domingo	Gold	Dollar	1.0000	
Serbia	Gold	Dinar	.1930	
Siam	Gold	Tical	.3709	
Spain	Gold	Peseta	.1980	Valuation is for the gold peseta; currency is silver circulating above its metallic value; exchange value, approximately, \$0.20.
Straits Settlements	Gold	Dollar	.5678	
Sweden	Gold	Crown	.2680	
Switzerland	Gold	Franc	.1980	Member Latin Union; gold is actual standard.
Turkey	Gold	Piaster	.0440	100 piasters equal to the Turkish £.
Uruguay	Gold	Peso	1.0342	
Venezuela	Gold	Bolivar	.1980	

(a) The exchange rates shown under this heading are recent quotations and given as an indication of the values of currencies which are fluctuating in their relation to the legal standard. They are not to take the place of the Consular certificate where it is available.

COKE. The production of coke in 1914 was the smallest, except in 1908, since 1905. It amounted to 34,550,914 short tons, valued at \$88,334,217. The production in 1913 was 46,299,530 short tons, valued at \$128,922,273. As the value of coke has a tendency to follow the rate of production, the prices in 1914 declined.

creased amount of iron produced, as practically all the coke is employed in the manufacture of iron. See IRON AND STEEL.

The total amount of coal consumed in the manufacture of coke in 1914 was 51,623,650 short tons, valued at \$74,949,565. The total number of ovens and retorts in operation de-

creased in 1914 from 102,650 to 99,755. The tendency to consolidate into large units is shown in the manufacture of coke as in the other branches of industry, and the number of coke-making establishments has shown a steady decrease since 1909. The total number of establishments in 1914 was 536. Pennsylvania is the chief producer of coke, and is followed by Alabama and Illinois. Nearly all the coal producing States produce coke in some quantities. The imports of coke in 1914 amounted to 133,266 short tons, valued at \$551,104. The exports amounted to 663,585 short tons, valued at \$12,233,686.

COLD STORAGE. See **FOOD AND NUTRITION; STOCK RAISING AND MEAT PRODUCTION.**

COLGATE UNIVERSITY. An institution for higher education, founded in Hamilton, N. Y., in 1819. The total enrollment in all departments in the autumn of 1915 was about 600. The faculty numbered 48. There were no noteworthy benefactions received during the year. John F. Vichert was appointed professor of pastoral theology and dean of the seminary to take the place of Prof. William H. Allison, who had resigned. The productive funds at the end of the fiscal year 1915 were \$180,974. The library contained over 75,000 volumes.

COLLEGES. See **UNIVERSITIES AND COLLEGES.**

COLLEGES, AGRICULTURAL. See **AGRICULTURAL EDUCATION.**

COLLISIONS. See **RAILWAY ACCIDENTS.**

COLOMBIA. A republic of northwestern South America, bordering the Caribbean Sea and the Pacific Ocean. The capital is Bogotá.

AREA AND POPULATION. The boundary with Brazil is undefined, and a large extent of territory claimed by Colombia is also claimed by both Peru and Ecuador. Estimates of area, therefore, differ widely. One estimate is 465,700 square miles; another, which probably more nearly approximates the eventual area of the republic, is 435,100 square miles. In 1835 the population was supposed to be about 1,686,000; in 1851, about 2,243,000; in 1871, about 2,951,000; in 1905, 4,533,777; in 1912 (census of March 5), 5,472,604. All of these figures include the population of Panama, which appears in the 1912 census with an estimated 400,000. With this figure deducted, the population of the republic becomes 5,072,604. But even the latter figures include some estimates. Thus the territories (intendencias and commissaries) of the republic are credited with 231,522 inhabitants, but this number includes estimates aggregating 94,000, mostly uncivilized Indians.

The population of the larger towns in 1912 was as follows (the figures relate to *municipios*, that is, districts which are organized for municipal purposes and which usually comprise rather extended areas): Bogotá, 121,257; Medellín, 71,004; Barranquilla, 48,907; Cartagena, 36,632; Manizales, 34,720; Sonrón, 29,346; Pasto, 27,760; Cali, 27,747; Aguadas, 26,423; Ibagué, 24,693; Palmira, 24,312; Neiva, 21,852; Montería, 21,521; Yarumal, 21,250; Cúcuta, 20,364; Bucaramanga, 19,735; Miraflores (Boyacá), 19,150; Loricá, 19,005; Popayán, 18,724; Cartago, 18,618; Pereira, 18,428; Andes, 18,391; Salamina, 18,195; Fredonia, 18,176; Bolívar (Cauca), 17,738; Abejorral, 17,508; Santa Rosa de Cabal, 17,009.

EDUCATION. Illiteracy is prevalent, and pri-

mary instruction, though free, is not compulsory. The number of primary schools reported for 1914 is 4184, with 280,367 pupils. Secondary schools in 1914 numbered 58 public and 246 private, with 6283 and 18,095 students, respectively. Most of the secondary schools are under the management of Roman Catholic orders. Normal schools in 1914 numbered 28, with 1728 students (649 male, 1079 female). There are a few schools for special or professional instruction. Bogotá has long been a conspicuous seat of Roman Catholic scholasticism. Its university, founded in 1572, has faculties of letters and philosophy, jurisprudence and political science, medicine and natural science, and mathematics and engineering. The University of Bogotá and the School of Mines at Medellín are national institutions. Besides Bogotá, there are several other universities so-called, as the University of Medellín, the University of Cauca, at Popayán, founded 1910, and the University of Magdalena, at Santa Marta, founded 1913. The state religion is Roman Catholicism.

PRODUCTION. In the economic development of the country, both agriculture and mining are important, and in some sections cattle raising is a large and profitable industry. The republic has a vast amount of fertile soil, but only a small proportion has been brought under cultivation. Industrial progress is handicapped by inadequate means of transportation. The leading crop commercially is coffee. Other leading products are bananas, ivory, nuts, cacao, sugar-cane, cotton, tobacco, and cereals. The mineral resources are of exceptional importance, especially in the department of Antioquia, and include gold, copper, lead, zinc, mercury, iron, platinum, salt, and emeralds. Manufactures, except Panama hats, are little developed.

COMMERCE. Imports and exports have been valued as follows:

	1911	1912	1913	1914
Imports—	\$18,108,863	\$23,964,623	\$28,535,800	\$20,979,229
Exports—	22,375,899	32,221,746	34,815,800	32,682,884

In 1912 and 1913, respectively, leading imports were as follows, in thousands of dollars: textiles, 10,547 and 11,455; metals, 2917 and 3164; foodstuffs and condiments, 3055 and 2817; railway cars and vehicles, 1032 and 1164; beverages, 836 and 1051; drugs and medicines, 838 and 947. Quantity of leading exports, in metric tons, in 1912: coffee, 559,993; bananas, 105,263; ivory nuts, 11,600; cattle hides, 5168; leaf tobacco, 3262. The rubber export in 1912 amounted to 503 metric tons. Value of leading exports in 1912 and 1913, respectively, in thousands of dollars: coffee, 16,778 and 18,270; gold, 4610 and 4100; cattle hides, 2262 and 3181; bananas, 1997 and 3060; Panama hats, 1175 and 960; tobacco, 442 and 921; ivory nuts, 755 and 819; platinum, 594 and 584; rubber, 736 and 378.

Trade by countries, in thousands of dollars:

	Imports		Exports	
	1912	1913	1912	1913
United States	7,612	7,630	15,833	18,862
United Kingdom	7,839	5,837	4,376	5,566
Germany	4,201	4,012	1,854	8,216
France	2,012	4,409	625	798
Belgium	571	499		594

Total, including other. 23,965 28,536 32,222 34,816

COMMUNICATIONS. The development of Colombia's natural resources is greatly impeded by the lack of adequate transportation facilities. Roads in general are merely mule tracks, though some of the main thoroughfares have been made, by the government, usable for ordinary vehicles and automobiles. To a considerable extent inland traffic is carried on by means of the Magdalena River and its tributaries. The railways form no continuous system, but consist of various short lines engaged in local traffic. The length of railway in operation in 1914 is reported at 708 miles, belonging to two States and nine companies. Reported length of telegraph lines, over 19,000 kilometers (over 11,800 miles). Post offices, over 800.

FINANCE. The monetary unit is the peso, equivalent to the American dollar. Silver coins fluctuate in value with the price of silver. The legal value of the paper peso is one one-hundredth of the monetary unit, but its actual purchasing power is somewhat variable. Exact reports of receipts and disbursements are not available. For 1914, the estimated revenue was 16,500,000 pesos gold; estimated expenditure for 1915, 18,500,000 pesos gold. The estimates submitted to the congress for the fiscal year 1916 were 11,900,000 pesos gold revenue, and 16,389,000 pesos gold expenditure. Customs revenue in 1914 amounted to 9,498,683 pesos gold.

Foreign debt, Jan. 1, 1915: consolidated, £2,174,600; other, £1,753,528 (including the 1913 loan of £1,182,248); total, £3,928,128. Internal debt, July 1, 1914, 2,365,684 pesos gold. There is, besides, an enormous outstanding paper currency.

ARMY. The national army of Colombia was being developed by the government supported by the good will of the citizens. Military service is compulsory, but the quota of recruits is drawn upon only to provide a force of about 6000 or 7000 men, though on a war basis these troops could be increased in number to about 50,000. Colombia received her first military instruction from Chile in 1907, when a military school was founded, and successively the government founded a school for officers, a course of application, a war college, and in 1911 a general staff, by which plans for compulsory service were prepared.

GOVERNMENT. The President is elected by direct vote for four years. He is assisted by a cabinet of eight members. There is no vice-president, but two *designados*, first and second, are elected by the Congress to succeed to the presidency, respectively, in case of the chief executive's death or disability. The Congress consists of the Senate (35 members, elected indirectly for four years) and the House of Representatives (92 members, elected by direct vote for four years). For the term ended Aug. 7, 1914, the President was Carlos E. Restrepo. For the following term José Vicente Concha was elected. First *designado*, Marco Fidel Suárez; second *designado*, Jorge Holguín.

HISTORY. *Relations with the United States.* Early in January the proposed treaty between the United States and Colombia came up for consideration in the United States Senate. There was much opposition to it because it contained provisions for the payment of \$25,000,000 to the southern republic to indemnify it for its claims to the Panama Canal Zone and for an apology for the method which was used in se-

curing the Canal Zone territory. Ex-President Roosevelt was loud in his denunciations of the proposed treaty. In February, Colonel Roosevelt published several articles on the subject which caused the Colombia legation in Washington to publish an answer to them and the legation in Paris to demand an apology from *Le Temps* for having republished them with comments. Notwithstanding the fact that popular sentiment in the United States appeared to favor the adoption of the treaty and 76 importing houses in New York City petitioned for favorable action, the Colombian treaty was allowed to die in the Senate Committee.

Internal Conditions. Advices from Bogotá in March stated that the President of Colombia, acting under a new law giving him extraordinary fiscal powers to meet the situation caused by the falling off in the customs receipts since the war began, had doubled the duty on stamped paper, doubled the inland revenue stamp tax, decreed the coinage of 2,000,000 pesos in silver, reduced the salaries of public officials 5 per cent, and taxed the exports of gold and valuable woods. In June, Colombia adopted a gold basis, giving up the silver standard which had been in operation for 21 years. In July, the National Congress met, selecting José María Gonzales Valencia president of the Senate, and Rafael Quizano Gómez president of the House.

COLORADO. **POPULATION.** The estimated population of the State on July 1, 1915, was, according to the United States Bureau of the Census, 935,799.

AGRICULTURE. The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1914-15 were as follows:

		Acreage	Prod. Bu.	Value
Corn	1915	470,000	11,280,000	\$6,204,000
	1914	462,000	10,626,000	6,376,000
Wheat	1915	560,000	18,310,000	10,648,000
	1914	475,000	11,312,000	9,842,000
Oats	1915	800,000	11,700,000	4,797,000
	1914	825,000	18,000,000	5,850,000
Rye	1915	30,000	525,000	868,000
	1914	21,000	368,000	239,000
Barley	1915	180,000	4,680,000	2,246,000
	1914	108,000	8,966,000	2,181,000
Potatoes	1915	53,000	7,155,000	8,935,000
	1914	73,000	8,760,000	4,880,000
Hay	1915	970,000	2,184,000	16,218,000
	1914	970,000	2,328,000	17,227,000

MINERAL PRODUCTION. The total value of the output of gold, silver, copper, lead, and zinc in 1914 was \$33,460,126, compared with \$35,450,585 in 1913. The gold produced was valued at \$19,883,105. There were produced 8,796,065 ounces of silver; 74,211,898 pounds of lead; 6,639,173 pounds of copper; and 96,774,954 pounds of zinc. There was an increase of \$1,176,189 in gold; and there was a decrease of 529,190 ounces in silver; 13,685,875 pounds in lead; 588,653 pounds in copper; and 22,571,465 pounds in zinc. In addition to the decrease in quantities of silver and the base metals, the falling off in the average value of these materials caused a decrease in value of \$768,270 for silver, \$973,238 for lead, and \$1,747,877 for zinc. Cripple Creek produced 6 per cent of the total gold of the State, with a total of \$11,996,116, as compared with \$10,905,083 in 1913. This is the largest production for any year since 1908. Cripple Creek, to the end of 1914, has produced \$258,786,653 in gold.

Lake County, which includes Leadville, pro-

duced 3,810,830 ounces of silver. The production of copper in the State was derived from the treatment of mixed ores in which copper was of minor importance. The total production of coal in 1914 was 8,170,559 short tons, valued at \$13,601,718. Compared with the production of 1913, this is a decrease of 1,061,951 tons, or 11.5 per cent in quantity, and \$433,372 in value. The small production was largely due to the condition of the strike which began in September, 1913, and prevailed through most of 1914.

TRANSPORTATION. The railway mileage of the State, on Jan. 1, 1915, was 5579. Of this, 4255 was standard gauge, and 1323 was narrow gauge. The roads having the longest mileage were the Denver and Rio Grande, 986; Union Pacific, 587; and the Atchison, Topeka, and Santa Fe, 512.

EDUCATION. The latest statistics available for education are for 1912. In that year the total school population between the ages of 6 and 21 was 227,187. The total enrollment in the graded schools below high school was 109,274. The enrollment in rural schools was 48,614, and in the high schools, 11,241, making a total enrollment of 173,129. Teachers in the graded schools below high schools numbered 6383, and in rural schools 2042. The average yearly salary of female teachers was \$656.19, and of male teachers, \$661.53.

CHARITIES AND CORRECTIONS. The charities and correctional institutions of the State include: The State Home for Dependent and Neglected Children, Soldiers' and Sailors' Home, Industrial Workshop for the Adult Blind, The State Home and Training School for Mental Defectives, State Insane Asylum, Industrial School for Boys, Industrial School for Girls, State Penitentiary, and State Reformatory. The total population of these institutions on Oct. 30, 1915, was 3112. The total expenditures for their maintenance for the twelve months ending June 30, 1915, was \$672,884. The Legislature of 1915 passed a measure providing for a lunacy commission in each county, to investigate and report to the County Court all cases of insanity. This Legislature appropriated \$450,000 for the maintenance and erection of buildings. A State board of corrections was created, in which was vested the control of the penitentiary, reformatory, and insane asylum.

POLITICS AND GOVERNMENT. Prohibition under the constitutional amendment adopted on Nov. 3, 1914, was to become effective Jan. 1, 1916. The State-wide prohibition bill contains provision for the enforcement of the prohibition constitutional amendment. It prohibits interstate and intrastate shipment of liquor for sale or gift except for medicinal and sacramental purposes. A workman's compensation law was passed by the Legislature. See **WORKMEN'S COMPENSATION**.

The House of Representatives on March 10th passed three bills, the effect of which would have been to abolish the juvenile court at Denver, and remove from office Judge Ben Lindsey, who for many years presided over that court, and had a national reputation for his method of dealing with juvenile offenders. The ostensible purpose of the bill was economy, but it was commonly known that the real object was to remove Judge Lindsey from office. The latter's term had two more years to run. The bill passed both houses, but the Governor vetoed it. On March 13th, Judge Lindsey asked the district

court for warrants of arrest against Dr. Mary Elizabeth Bates; E. R. Whitehead, secretary of the State Humane Society; Frank Rose, a lawyer; and R. P. Rawlings. He charged them with a conspiracy to defame his character. The House of Representatives on March 15th expelled Representative W. W. Howland on charges of perjury. This action followed an investigation by a special committee, which found that Howland had received a sum of money which he admitted came from Dr. Mary Elizabeth Bates, and was to pay a woman detective for work in shadowing the probation officer of the juvenile court. On April 12th, report of the grand jury exonerated Judge Lindsey from charges of misconduct, which had been brought against him. Frank Rose was indicted on a charge of criminal libel in connection with affidavits reflecting upon the character of Judge Lindsey. On January 12th, the latter was arrested on a charge of contempt of court, and connivance in the commission of perjury. This charge grew out of the refusal of Judge Lindsey, on January 8th, to divulge on the witness stand in the trial of Berta Wright, accused of murder, a confidential conversation with Neal Wright, a twelve year old son of the defendant. Judge Lindsey said that the whole juvenile court work was founded upon the protection of children in giving confidence to him, and that what he had learned from Neal Wright came to him as a privileged communication. Judge Lindsey was held guilty for contempt of court, and was fined \$500 and costs on November 15th. Wards of the juvenile court, over which he presided, at once started a movement to collect 50,000 pennies from the children of Denver with which to pay the fine.

W. W. Howland, who, as noted above, was expelled from the House of Representatives on a charge of perjury, was acquitted on July 2nd. Judge Perry of the District Court upheld the contention of his attorneys that alleged false statements of the defendant before a grand jury did not constitute perjury under the statute of the State.

STATE OFFICERS. Governor, George A. Carlson; Lieutenant-Governor, Moses E. Lewis; Secretary of State, John E. Ramer; Auditor, Harry E. Mulnix; Treasurer, Allison E. Stocker; Superintendent of Public Instruction, Mary C. C. Bradford; Attorney-General, Fred Farrar.

SUPREME COURT. Chief Justice, William H. Gabbert; Associate Justices, S. Harrison White, William A. Hill, James C. Garrigues, Morton S. Bailey, and Tully Scott.

COLORADO, UNIVERSITY OF. A State institution for higher education, founded in 1876 at Boulder, Colo. The total enrollment in all departments in the autumn of 1915 was 1400. This does not include the enrollment in the summer session, extension division, or the pupils in the training school. The faculty numbered about 200. William R. Arthur, LL.B., and Fred G. Filson, LL.B., were appointed professors of law. The university is supported chiefly by legislative appropriations. The annual income from this source is about \$320,000. Other productive funds amount to about \$75,000. The library contained 80,000 volumes.

COLORADO INDUSTRIAL DISPUTES. See **ARBITRATION AND CONCILIATION**, *Colorado Industrial Disputes Investigation Act*.

COLORED METHODISTS. See **METHODISTS, COLORED**.

COLTON, CHARLES HENRY. American Roman Catholic bishop, died May 9, 1915. He was born in New York City in 1848; graduated from St. Francis Xavier College in 1872; afterwards studied at St. Joseph's Seminary at Toledo; and was ordained a priest in 1876. From that year until 1903 he served as assistant and pastor at St. Joseph's Church, New York. During the same period he was also chancellor of the diocese of New York. He was made bishop of Buffalo, Aug. 5, 1903. He was the author of: *Seedlings* (1906); *My Trip through Rome and the Holy Land* (1906); and *Buds and Blossoms* (1910).

COLUMBIA UNIVERSITY. An institution for higher learning, founded in 1754 in New York City. The total enrollment in all departments in the autumn of 1915 was 16,404. The faculty numbered 981. The most notable benefactions received during the year were those from Mr. William K. Vanderbilt for the new medical site, \$113,750; from the estate of Joseph Pulitzer for the endowment fund of the School of Journalism, \$50,000; from an anonymous donor for the better equipment of the chemical laboratories in Havemeyer Hall, \$30,000; from Mrs. Samuel W. Bridgman to establish a fund for the endowment of a research fellowship, \$20,000. The productive funds at the end of the fiscal year amounted to \$30,260,903, and the income to \$1,206,324. The library contained about 550,000 volumes.

COMAN, KATHERINE. American educator, died Jan. 11, 1915. She was born in Newark, Ohio, in 1857, graduated from the University of Michigan in 1880; was professor of history at Wellesley College, 1883-1900; and, from 1900-13, professor of economics in the same college. She retired as professor emeritus in 1913. Her published writings include: *The Growth of the English Nation* (1895); *History of England* (1899); *History of England for Beginners* (1901); *Industrial History of the United States* (1905); *Economic Beginnings of the Far West* (1911).

COMSTOCK, ANTHONY. American public official, died Sept. 21, 1915. He was born in New Canaan, Conn., in 1844, and received an academic education. In 1863 he joined the Seventeenth Connecticut Volunteers, and served throughout the Civil War, receiving an honorable discharge in 1865. He returned to New York in 1867, and for a time worked in various capacities in wholesale business houses. On March 5, 1873, as special agent for the recently organized Society for the Suppression of Vice—a position he held for the rest of his life—he

caused the arrest of venders of obscene books, and shortly afterwards gave most of his time to investigating the sale of such books in New York City. He was, in addition, appointed special agent in the Post Office Department, and served the United States government without pay in that capacity until January, 1907. During that time he made more than 3600 arrests, and seized more than 155 tons of obscene literature, and other printed matter. His efforts were also directed toward the suppression of policy sharks, and lotteries, and other gambling devices. He succeeded in placing upon the statute books many laws for the suppression and control of these and other iniquities. The act of Congress in 1873, with the amendment of 1876, making it a felony to send obscene matter through the mail, was drafted by him. He also drew up the act which drove public lotteries out of the United States. His zeal in suppressing the exhibition of what he considered to be immodest paintings brought him much notoriety and abuse; but the value of his work as a whole is beyond question. He was the author of: *Frauds Exposed* (1880); *Gambling Outrage* (1887); *Morals vs. Art* (1887); and *Traps for the Young* (1890).

CONANT, ALBAN JASPER. American artist, died Feb. 3, 1915. Born in Chelsea, Vt., in 1821, and graduated from the Gouverneur Wesleyan Seminary in 1844, he removed to Missouri, and for eight years was curator at the University of Missouri. He founded the school of mines and metallurgy, of which for three years he was supervisor. His distinction, however, lies in his portrait painting. "The Smiling Lincoln" was from his brush, as were also portraits of Major Anderson, who commanded Fort Sumter, of General Sherman of members of Lincoln's cabinet, and of other noted men of his day. His portrait of James McCosh is in the Metropolitan Museum of Art in New York City. In addition to his portraits, he painted a number of historical scenes, the best known of which is perhaps "The Burial of De Soto." He wrote several books, among them: *The Archaeology of the Missouri Valley*; *Footprints of Vanished Races in the Missouri Valley*; and *My Acquaintance with Lincoln*. He received degrees from Madison University and the University of Missouri.

CONANT, CHARLES ARTHUR. An American economist and writer, died July 6, 1915. He was born in Winston, Mass., in 1861, and was educated in public and private schools. In 1887 he became a Washington correspondent of the *New York Journal of Commerce*, the *Springfield Republican*, and other papers. Until 1901 he continued in newspaper work, establishing a national reputation as an expert on financial and monetary matters. In 1901 he was appointed special commissioner of the War Department in the Philippines, and in this capacity made a report on the monetary and financial conditions in the islands on which the government based the remodeling of the currency system in the Philippines. Two years later he went to Mexico, to aid in the plans for the monetary reform of that country. He became a member of the Commission of International Exchange of the United States in the same year. He was, in 1906, a member of the special committee of the New York Chamber of Commerce on currency reform; and was an officer and director in several large financial institutions. He took an active inter-

est in politics, and in 1894 was Democratic candidate for Congress. He left the Democratic party as a result of the silver issue in 1896, and was a delegate to the Gold Democratic convention in that year. His published writings include: *The United States in the Orient* (1900); *Alexander Hamilton* (1901); *Wall Street and the Country* (1904); *The Principles of Money and Banking* (1905); *History of Modern Banks of Issue* (1909). He also contributed financial and economic articles to the important magazines.

CONATY, THOMAS JAMES. American Roman Catholic bishop, died Sept. 18, 1915. He was born in Ireland, in 1847, but removed to Canada, and from 1863 to 1867 studied at Montreal College. Graduated from the Holy Cross College in 1867, and from the Theological School in 1872, in the last-named year he was ordained a priest. From 1880 to 1897 he was pastor of the Church of the Sacred Heart at Worcester, Mass., and in 1896 succeeded Bishop Keane as rector of the Catholic University at Washington. In the following year Pope Leo XIII conferred on him the title of domestic prelate, and in 1901 nominated him titular bishop of Samose. He was appointed to the see of Monterey and Los Angeles, Cal., in 1903. Bishop Conaty was identified with many important educational and social movements. He founded, and for four years edited, the *Catholic School and Home Magazine*. In 1887-88 he was president of the Catholic Total Abstinence League of North America, and was one of the organizers, and was president from 1893 to 1897, of the Catholic Summer School at Plattsburgh, N. Y. He was the author of *Bible Studies for Use in Schools and Colleges* (1898).

CONCILIATION, INDUSTRIAL. See **ARBITRATION AND CONCILIATION, INDUSTRIAL**; and **STRIKES AND LOCKOUTS**.

CONCRETE. The various problems connected with the mixing and handling of concrete were under discussion during 1915, and it was realized by many engineers that their mixing periods, spouting of wet cement, carting over long distances, and other like practices, tended toward a non-uniform and unsatisfactory concrete. There was a tendency manifested during the year in favor of longer mixing and more care in preparing the concrete, and engineers were paying more attention to the work of contractors in depositing the concrete in place. Tests made at the United States government laboratory at Pittsburgh during the year, where concrete was made with gravel, limestone, and broken slag for coarse aggregate, showed the respective merits of these materials. Using standard 8 x 16-inch cylinders of 1:2:4 concrete and testing at the end of 7 days, 28 days, 90 days, and 6 months, it was found that the concrete with slag aggregate was practically the same strength as the limestone concrete, and both averaged much higher at all stages than the gravel concrete.

On Nov. 13, 1915, Judge Robert E. Lewis, of the Colorado Federal District Court, rendered a decision declaring six concrete bridge patterns void, on the ground that the alleged inventions were non-patentable at the time of application. This was in a suit of Daniel B. Luten against Well County, Colo., and the principle laid down was that the arrangement of metal parts in a body of reinforced concrete to resist stresses in-

volved merely mechanical design and not invention. This decision was of interest on account of its broad application, and the number of reinforced concrete patents on which royalties were being paid that necessarily would be involved. It also was considered as having a bearing on structural patents generally, so that the question of whether the decision would be upheld in the higher courts was a matter of considerable interest.

REINFORCED CONCRETE. During the year progress was being made on the notable group of buildings for the Massachusetts Institute of Technology on the banks of the Charles River, Cambridge, Mass., in which reinforced concrete plays an important part. The central building of the group is surmounted by a large dome, and while the external construction is of limestone the structure itself is of reinforced concrete. The dome rises to a height of 147½ feet above the general level, and 65 feet above the parapets of the surrounding buildings. The concrete was poured from a tower 190 feet high, about 100 feet away from the dome centre, with a chute supported by an intermediate tower. The completion of various stadiums for universities showed a development in design as well as in construction for these great amphitheatres. That for the College of the City of New York, for example, supplied facilities not only for athletic contests, but for pageants and open air dramatic or musical functions. For these stadiums increased decorative effects were being secured.

In a six-story reinforced concrete structure completed during the year for the *Youth's Companion*, Commonwealth Avenue, Boston, Mass., a new type of slab reinforcement was employed, which was claimed to result in a saving of from 20 to 40 per cent in the steel required, as compared with ordinary types. This building, which was to be used for the printing, editorial, and business departments of the weekly paper, was 165 x 100 feet, with columns so spaced that the floor slabs were 14 feet 9 inches by 20 feet 6 inches. The floor reinforcement consisted of three separate units: a series of short rods at the bottom of the slab which formed the cross bands, the bottom steel at the centre of the panel, and the top steel over the column head, a patented arrangement which served to give strength and economy of material. Three standard thicknesses of floor slab were used—one 9 inches thick for the second floor, which carried the heavy printing presses, with a live load of 300 pounds per square foot; an 8-inch slab for the basement over the sub-basement, and for the first, third, and fourth floors, used as storage rooms, and the remainder of the printing plant, designed for a 200-pound per square foot live load; and a 7-inch slab for the fifth and sixth floors and the roof, designed for a live load of 100 pounds per square foot.

CONDENSED MILK. See **DAIRYING**.

CONDON, EDWARD O'MEAGHER. Irish patriot, died Dec. 15, 1915. Born in Ireland, he removed to New York City, prior to 1861, and served throughout the Civil War. After the war he returned to Ireland, and was prominent in the Fenian movement. On account of his activities in obtaining the release of Kelley and Deasey, he was condemned to die, but because he was an American citizen this sentence was commuted to life imprisonment. At the close of twelve years

in British prisons, he was pardoned, but exiled. He came to the United States, and obtained a position as supervising architect in Washington, which position he filled until a short time prior to his death.

CONFERENCES OF CHARITABLE AND SOCIAL ORGANIZATIONS. See CHARITIES, *passim*.

CONGO, BELGIAN. A central African colony of Belgium (the former Congo Free State). The capital is Boma. All the statistics given below are from the official report of the Belgian colonial minister.

AREA AND POPULATION. The colony covers an area of 2,365,000 square kilometers (913,127 square miles); white population (Jan. 1, 1912), 5465. No official estimate of native population is given; other sources vary from 9 to 20 millions. Besides Boma, important towns are Matadi, Banana, Leopoldville, Stanleyville, Kambove, Niangara, Bandundu, etc.

PRODUCTION. The chief products of the country are shown in the list of exports, rubber leading in importance. The Kilo gold mine, in the Ituri basin, not far from Lake Albert, has 8 experts and 1750 negro workers, and produced (1910) 867 kgs. of gold. Gold is also found in the Katanga district.

Sale of crown lands in 1910, about 14 hectares, at a total price of 241,528 francs; crown lands rented in 1910, 4062 hectares, rental, 18,345 francs. A large proportion of these lands is in the Katanga district.

COMMERCE. Total imports (general trade) in 1910, 43,979,000 francs; exports, 95,599,000 francs. In 1911, 58,385,000 and 78,955,000 francs. In 1912, 61,864,000 and 83,465,000. Exports, details, and totals (general trade), are shown below, values in thousands of francs:

Articles	1907	1908	1909	1910
Rubber	57,330	40,144	60,171	76,030
Palm oil	1,741	1,376	1,095	2,016
Palm nuts	2,522	2,056	2,199	3,101
Ivory	11,034	9,597	10,554	9,361
Various	4,914	3,694	4,195	5,091
Total exports	77,541	56,867	78,014	95,599

Exports of the principal products in the special trade are shown in the table below for comparative years, 1901-05 yearly average for the period, in thousands of francs:

	1901-05	1910	1911	1912
Rubber	44,056	51,016	34,427	34,519
White copal	739	3,343	1,314	6,385
Ivory	4,284	6,056	5,683	5,552
Copper			1,834	4,112
Gold	140	2,515	3,119	3,832
Palm nuts	1,489	2,657	2,879	2,771
Palm oil	986	1,798	1,732	1,253
Cacao	150	1,071	896	1,115

Imports in 1912 to the value of 35,785,348 francs came from Belgium, and exports valued at 53,883,269 francs went to Belgium; United Kingdom, 5,670,133 francs imports, and 557,920 francs exports; Germany, 4,078,710 imports; France, 1,143,738 imports; Netherlands, 1,113,487 imports, and 1,172,345 exports; etc. There were entered at the ports in the 1912 trade, 705 vessels of 1,044,864 tons.

RAILWAYS. On Jan. 1, 1912, the various railway lines with holdings, were as follows: Congo Railway Company, 400 kilometers; Stanleyville-Ponthierville, 125; Kindu-Kongolo, 355; Lua-

laba-Tanganyika, 300 (approximate length under construction); Rhodesian frontier-Elisabethville and Elisabethville-Bukama, 275 in operation and 168 under construction; Boma-La Lukula, 80. In 1914 the Cape-to-Cairo Railway reached the copper district in the centre of the colony.

The construction of the railway north from Kambove to Bukama was actively continued during 1915. The total distance was 204 miles, and December 31st the rails were laid for 69 miles, and in March, 1915, 86 miles had been finished and the roadbed completed over 96 miles. The railway had reached the high Biano plateau, which was free from tsetse fly, making it possible to land breeding stock there by rail. The headquarters of the construction was then moved from Kambove to 66 miles beyond, and this section of the road was used for the regular transport of passengers and merchandise. Kambove is connected by rail with South Africa via Elisabethville, and, once Bukama is reached, there will be complete rail and water connection between South Africa and Boma. The railway under construction between Kabalo, on the Luabala River, and Lukuga, on Lake Tanganyika, a distance of about 250 miles, was practically completed, but had not been pushed quite to the shore of the lake, where the Germans were masters for a time. The final link in the line of communication between the mouth of the Congo and Lake Tanganyika was completed during the year. Ocean going vessels could go as far as Matadi, 85 miles from the mouth of the river; thence a railway of 260 miles runs to Stanley Pool, the river from that point being again navigable to Stanleyville, a distance of 1000 miles.

FINANCE AND GOVERNMENT. Financial statistics appear in the table below in thousands of francs for four years (1913 and 1914 budgets):

	1911	1912	1913	1914
Revenue	40,870	45,368	40,418	30,451
Expenditure	*59,658	†66,539	50,933	‡63,076

* Including 12,222,443 francs extraordinary. † Including 16,818,660 francs extraordinary. ‡ Including 11,139,573 francs extraordinary.

The total debt amounts to 278,747,200 francs. A Governor-General administers the colony.

CONGO, FRENCH. The former name of French Equatorial Africa (q.v.). The name was changed in 1910.

CONGO FREE STATE. See CONGO, BELGIAN.

CONGREGATIONALISM. According to official statements the total membership of this denomination in 1915 was 763,182. There were 6093 churches; 5923 ministers, of whom 4095 were pastors and 1828 were without charge; Sunday School pupils, 757,873. There were 3120 Young People's Societies of Christian Endeavor, with 133,474 members; 1527 men's organizations, with 85,811 members. The total contributions to all branches of the work of the denomination in 1915 amounted to \$2,272,040, and the total expenditures, \$10,716,311. The average salary of 4693 churches was \$968; the value of church property was \$84,565,377.

The national societies include the Congregational Educational Society, the American Congregational Association, the American Board of Commissioners for Foreign Missions, the Congregational Home Missionary Society, the American Missionary Society, the Congrega-

tional Church Building Society, the Congregational Board of Ministerial Relief, the Congregational Sunday School and Publishing Society, the Woman's Home Missionary Federation, and the Woman's Board of Missions. Foreign missions are under the control of the American Board of Commissioners for Foreign Missions, to which Congregationalists contributed \$313,527 in 1915. Home missions are carried on by the Congregational Home Missionary Society, in 28 States and Territories, the total receipts for home missions in 1915 amounting to \$325,477. In 1915 there were about 1700 missionaries under commission for a whole or a part of the year. The theological seminaries are at Cambridge, Mass. (Andover Theological Seminary), Atlanta, Bangor, Hartford, Chicago, Oberlin, Talladega, Berkeley, and Yale. The social work of the Church is in the hands of the Social Service Commission of the Congregational Church, which is a development from the work of the Department of Labor and Social Service of the Congregational Brotherhood of America. The general administration of the Church is under the control of the National Council. The latter's session for 1915 was held at New Haven, Conn. The officers elected were: Moderator, Hon. H. M. Beardsley; assistant moderator, Rev. A. C. Garner; secretary, Rev. Hubert C. Herring; treasurer, John J. Walker.

CONGREGATIONAL METHODIST CHURCH. The denomination has the larger part of its membership in the Southern States. It has a publishing house at Ellisville, Miss. The only educational institution under its control is the Atlanta Bible School, and in that city is published its official journal, *The Messenger*. There were in this denomination in 1914, 15,629 communicants, 333 churches, and 337 ministers.

CONGRESS. See UNITED STATES.

CONNECTICUT. POPULATION. The population of the State, as estimated by the United States Bureau of the Census, on July 1, 1915, was 1,223,583.

AGRICULTURE. The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1914-15, were as follows:

	Acreage	Prod. Bu.	Value
Corn1915	65,000	8,250,000	\$2,782,000
1914	61,000	2,806,000	2,497,000
Oats1915	13,000	422,000	232,000
1914	11,000	319,000	175,000
Rye1915	7,000	150,000	158,000
1914	7,000	133,000	180,000
Potatoes ...1915	24,000	2,280,000	2,189,000
1914	24,000	3,360,000	2,184,000
Hay1915	365,000	a 493,000	9,860,000
1914	375,000	469,000	9,146,000
Tobacco ...1915	22,200	b 29,970,000	5,095,000
1914	20,200	35,754,000	6,614,000

a Tons. b Pounds.

TRANSPORTATION. The total length of track operated in Connecticut in 1915 was 2725. In addition there were 915 miles of second track, 129 miles of third track, and 128 miles of fourth track. The longest mileage was that of the New York, New Haven, and Hartford—2004; the Central New England Railway—303; the Central Vermont—411. For developments in regard to the suit against the New York, New Haven, and Hartford Railway in 1915 see **RAILWAYS**.

EDUCATION. The total school population in 1915 was 276,349. The total number in public schools was 211,975, with an average daily attendance of 168,060. The teachers male and female numbered 5857. The total school expenditures amounted to \$8,112,003.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include the Soldiers' and Sailors' Home at Noroton Heights, Connecticut Hospital for the Insane at Middletown, Norwich State Hospital for the Insane, Connecticut State Prison at Wethersfield, Connecticut School for Boys at Meriden, Connecticut Industrial School for Girls at Middletown, Connecticut Colony for Epileptics at Mansfield, and Connecticut School for Imbeciles at Lakeville.

POLITICS AND GOVERNMENT. The Legislature met in 1915, but passed measures chiefly local and unimportant. A woman's suffrage bill was killed in the House of Representatives by a unanimous vote and without comment from any member. It is now necessary for advocates of the measure to wait two years before bringing it again to the attention of the Legislature. The Connecticut Legislature authorizes a voter to retain for six months, for the purpose of voting, residence in the town from which he moved, and meanwhile he is regarded as a resident of the town to which he removes, for the purpose of becoming a voter there.

STATE OFFICERS, 1915. Governor, Marcus H. Holcomb; Lieutenant-Governor, Clifford B. Wilson; Secretary of State, Charles D. Burnes; Treasurer, Frederick S. Chamberlain; Comptroller, Morris C. Webster; Attorney-General, George E. Hinman; Adjutant-General, Brig.-Gen. George M. Cole; Commissioner of Insurance, Burton Mansfield—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, Samuel O. Prentice; Associate Justices, George W. Wheeler, John M. Thayer, Alberto T. Roraback, John K. Beach; Clerk, Geo. A. Conant.

STATE LEGISLATURE:

	Senate	House	Joint Ballot
Republicans	30	197	227
Democrats	5	60	65
Republican majority..	25	137	162

COPPER. The smelted production of copper in 1914 showed a considerable decrease from that of 1913. This was due to the unfavorable market conditions, brought about by the European war, and prevailing during the last five months of the year. The refinery production also showed a reduction due to the same causes.

The total production by smelters from copper-bearing materials in 1914 was 1,150,137,192 pounds, valued at \$152,968,246, compared with 1,224,484,098 pounds valued at \$189,795,035 in 1913. The mine production in 1914 was 1,148,431,437 pounds. Copper was mined in 22 States and Territories during the year. The four leading States are Arizona, Montana, Utah, and Michigan, producing 82 per cent of the total output in 1914. Montana, Michigan, and Arizona are the three great copper producing States. Montana ranks first, with nearly one-third of the entire output of the country; Michigan ranks second with more than 28 per cent; and Arizona third, with more than one-fifth.

The following table gives the production of copper in the various States in 1913-14.

State	1913	1914
Alaska	23,428,070	24,985,847
Arizona	404,278,809	382,449,922
California	82,492,265	29,784,173
Colorado	9,052,104	7,316,066
Idaho	8,711,490	5,875,205
Michigan	155,715,286	158,009,748
Montana	285,719,918	236,805,845
New Mexico	50,196,881	64,204,703
Nevada	85,209,536	60,122,904
Oregon	77,812	5,699
South Dakota	4,549	
Utah	148,057,450	160,589,660
Washington	732,742	688,602
Wyoming	862,285	17,082
Eastern States and unapportioned	20,449,951	19,286,836
Total	1,224,484,098	1,150,137,192

The exports of metallic copper from the United States amounted to 840,080,922 pounds, valued at \$117,633,145. The imports amounted to 306,350,827 pounds. See METALLURGY.

COPYRIGHT. According to the report of the register of copyrights for the fiscal year 1914-15 the registrations numbered 115,193, as compared with 123,154 for the preceding year. Of the registrations for 1915, 104,420 were for \$1 each, including a certificate, and 9447 were for photography without certificates. The registrations included chiefly books, periodicals, dramatic and musical compositions, works of art and reproductions thereof, photographs, and prints. There were 1326 registrations of renewals. The applied fees for the year were \$111,922.75, more than double those for 1897-98. The copyright registrations are indexed upon cards. The temporary cards made for the indexes to the printed catalogue, numbering 87,227 during 1914-15, have been eliminated and the remaining cards, 107,337 for the fiscal year, were added to the permanent card indexes, now numbering over 2,825,000 cards.

There was no new copyright legislation in 1915. Several bills were introduced, but they failed to pass. Conspicuous among these was the Levy Bill for depriving publishers or authors of the secondary meaning right in material on which copyright had expired. The secondary meaning right is practically the trade right in the title of a work, and is somewhat of the nature of a trade mark right. There was a large amount of moving picture litigation, but it was not conclusive, as final decisions were not handed down by the Supreme Court of the United States. The whole question of moving picture rights and their relation to dramatic rights is yet to be settled. There are two contentions: (1) moving picture and dramatic rights are identical; (2)

they are separate and distinct. These two contentions are yet judicially undecided; but the indications of recent cases before the courts are in favor of the second. The copyright amendment act of 1912 recognizes the distinction between moving picture and dramatic rights; but this lacks the force of a judicial pronouncement. So far as the litigation is concerned the bigger feature productions are conspicuous by reason of the large amounts of money involved.

In the early part of the Congressional session, Senator Penrose introduced a bill to provide for copyright protection for motion picture scenarios. These were not copyrightable hitherto any more than book or short story manuscripts. They are protected under the common law rights of literary property; but a great many scenario writers have been agitating for copyright protection. Expert opinion on the subject seems to be that one decided benefit of this protection would be the record of the date when the author had the completed manuscript in his possession. In an infringement suit it is important, if not essential, to prove the priority of the plaintiff's material over that of the alleged infringer. The Authors' League of America has made an attempt to assist authors in providing proof of such priority by establishing a registration bureau where members and non-members, upon complying with the rules, may register their scenarios. They receive a receipt card, bearing the date of the deposit, title, author's name, number, etc.; and a record of the deposit is made in the books of the Authors' League.

The convention on literary and artistic property signed at Buenos Aires, on August 11, 1910, was between the United States and 19 Central and South American governments. On July 13, 1914, the President of the United States proclaimed this convention as effective between the United States and the Dominican Republic, Ecuador, Guatemala, Honduras, Nicaragua, and Panama. Bolivia has recently signified its adherence to the convention.

A British order-in-council was signed on Feb. 3, 1915, to protect within the British dominions, excepting Canada, Newfoundland, Australia, New Zealand, and South Africa, the unpublished works of the citizens of the United States. It ordered that the British Copyright Act of 1911 should apply from Jan. 1, 1915; but that enjoyment of rights conferred by the order should be subject to the accomplishment of conditions and formalities prescribed by the laws of the United States. The order was made upon the understanding that a proclamation would be issued by the President of the United States extending certain copyright protection to the subjects of Great Britain.

CORAL REEFS. See GEOLOGY.

CORN. Data pertaining to the world's corn crop of 1915 were much less complete than those regarding the crops of preceding years. For the calendar year 1915 the world's production was estimated at 3,921,000,000 bushels, including the harvest of the Northern Hemisphere, which constitutes from 93 to 94 per cent of the world's corn crop, together with the yield of the Southern Hemisphere which was harvested early in the year. The crop in the principal corn-producing countries of the Southern Hemisphere to be harvested early in 1916 was reported as promising a satisfactory yield. The 1915 production in the Northern Hemisphere according to an es-

timate of the International Institute of Agriculture based on returns received from most of the principal corn growing countries north of the equator was placed at 3,596,000,000 bushels, this output being greater by about 14 per cent than the total of the yields in 1914 for the countries concerned. A calculation based on the records of the world's corn consumption for the preceding five years pointed out that the world's requirements for 1915-16 could be met adequately by the visible supply made up of the new crop harvested and the quantities carried over from the preceding year. The quantity of corn from the crop of the preceding year on hand in the United States on Nov. 1, 1915, was estimated at almost 90,000,000 bushels, or about 50 per cent more than on Nov. 1, 1914. The average annual value of corn and corn meal carried in international trade is placed at \$210,000,000.

The 1915 corn crop of the United States as estimated by the Department of Agriculture amounted to 3,054,535,000 bushels, second in quantity only to the crop of 1912. The crop area was 108,321,000 acres which was surpassed by the acreage of 1909. The average yield per acre, 28.2 bushels, had been reached and surpassed a number of times. The total value of the crop based on the average price of 57.5 cents per bushel to farmers on December 1st of the year was placed at \$1,755,859,000, a total value that had never been reached and which stood over \$33,500,000 above the total value of the preceding year which ranked next. While the crop of 1915 ranked high in production and cash value it was considered doubtful that its feeding value was as great as that of the crop of 1914. Weather conditions were unfavorable and the quality of the crop was much reduced. Low temperature in August together with a high rainfall during the growing season in a considerable portion of the corn belt retarded the growth of the crop, and frosts early in October which in a normal year would have done no harm injured the immature corn and prevented the proper ripening of a large percentage of the crop. These conditions were most pronounced in Iowa and the northern part of Illinois. The earlier varieties generally planted in Minnesota and Wisconsin proved an advantage to these States, and the season was also more favorable in Nebraska and Kansas, where enough but less rain fell than in Iowa and parts of Illinois. A large percentage of the ears in these sections were light and soft, which led to an early feeding of stock in order to use as much as possible of the soft corn before spoiling. As a result there was a much heavier market movement of cattle and hogs early in the season than is usual under ordinary conditions. The immaturity of the crop also made seed corn selection difficult and in some localities corn of the previous year was retained for seed. Owing to the condition of the crop it was estimated that more silage was put up in 1915 than would otherwise have been the case. It is of interest to mention here that an inquiry made by the Department of Agriculture indicated that about 8 per cent of the corn acreage of 1914 was cut for silos, 11 per cent cut green for feed, and 81 per cent was matured for the grain; or, applied to the acreage, about 8,364,000 acres were used for silage, 11,282,000 cut for green feed, and 83,789,000 allowed to mature. It was fur-

ther reported that in the New England States more than half the crop is cut for silage; in Wisconsin, 36 per cent for silage and 18 per cent for green feed; Michigan, 28 per cent for silage and 13 per cent for green feed; and Illinois, 9 and 10 per cent respectively. The States leading in grain production in 1915 and their yields were as follows: Illinois, 376,164,000; Iowa, 303,000,000; Nebraska, 213,000,000; Missouri, 209,450,000; Indiana, 190,950,000; Texas, 175,075,000; and Kansas, 172,050,000 bushels. The highest average yield per acre, 50 bushels, was reported for Connecticut. The production of Canada was placed at 14,594,000 bushels from 253,300 acres, or at the rate of 57.62 bushels per acre.

CORNELL UNIVERSITY. An institution for higher education, founded in 1865 at Ithaca, N. Y. The total enrollment in all departments on Nov. 1, 1915, exclusive of duplicates, was 5392. There were 750 members of the faculty. Notable gifts received by the university during 1915 were the following: \$150,000 from George F. Bailey of New York City for a residential hall; \$20,000 from an unnamed donor for the university dining halls; \$7500 from the executors of the Fiske Estate, an addition to the Library Endowment Fund; \$6000 from J. G. White, an engineering contractor of New York City, for the endowment of prizes in Spanish; \$3000 from Hiram W. Sibley for additional equipment for Sibley College; \$3800 for the Luana L. Messenger Prize fund, under the will of Hiram John Messenger, of the class of 1880. The donations received by the university amounted in all to \$202,632. The productive funds at the end of the fiscal year of 1915 amounted to \$14,057,115, and the annual income for the fiscal year, to \$1,644,516. The library contained 455,129 volumes.

CORPORATION, AMERICAN INTERNATIONAL. See FINANCIAL REVIEW.

CORPORATIONS. See TRUSTS and TAXATION.

CORPORATION TAX. See TAXATION.

CORRECTION. For matters connected with this subject, see CHARITIES.

COSTA, AFONSO. A Portuguese statesman, died July, 1915. He was for many years one of the strongest political leaders in Portugal, and at various times premier, minister of finance, and minister of justice. He was the author of the law providing for the separation of the Church and State in Portugal. An advocate of revolution, he was several times sent to exile for attempted uprisings, and was imprisoned as ringleader of the attempted revolution in January, 1908.

COSTA RICA. A Central American republic situated between Nicaragua and Panama and bordering both the Caribbean and the Pacific coast. Capital, San José.

AREA, POPULATION, ETC. The area is estimated at 48,110 square kilometers (18,691 square miles). The estimated population in 1884 was 195,906; at the end of 1912, 399,424; 1913, 410,981; 1914, 420,179. Births in 1913 and 1914, 17,746 and 18,633; deaths, 9382 and 9482. The population of San José at the end of 1913 was stated at 33,900; Heredia, 8000; Cartago, 7000; Limón, 7000; Alajuela, 6260; Puntarenas, 4850. The white population dwells largely in these towns. In 1913 there were 414 public elementary schools, with 1306 teachers,

33,084 pupils, and an average attendance of 28,690. There are a few secondary schools and faculties for professional education. The state religion is Roman Catholicism.

PRODUCTION AND COMMERCE. According to figures published in 1915 by the Pan-American Union, there were in 1914, 323,680 hectares under cultivation, of which 28,681 hectares in coffee, 24,127 in bananas, 11,928 in sugar cane, and 2604 in cacao. Other important crops are corn, beans, potatoes, and rice. Cattle raising is a profitable industry, especially in the west and in the districts adjoining Nicaragua. The number of cattle reported in 1915 is 337,061. Horses number about 60,000. Gold and silver are mined.

Imports and exports have been valued as follows, in thousands of colones:

	1910	1911	1912	1913	1914
Imports	16,984	19,080	21,676	18,678	16,240
Exports	18,009	19,192	21,428	22,197	28,359

The principal imports are cotton goods, structural iron and steel and railway material, coal, flour, and lard. The bulk of the exports consist of bananas and coffee. In 1912, 10,647,702 bunches of bananas were exported; in 1913, 11,170,812 (of which, to the United States, 8,352,722, and to the United Kingdom, 2,713,111). The coffee export in the crop year ended Sept. 30, 1912, was 12,238 metric tons; in 1913, 13,019 (of which 82 per cent to the United States). The banana and coffee exports in 1912 were valued at 10,647,702 and 7,623,561 colones respectively; in 1913, 11,170,812 and 7,752,750; in 1914, 10,163,000 and 10,029,000. Other export values in 1914: Gold and silver, 1,443,000 colones; woods, 268,000; hides, 256,000; cacao, 181,000; rubber, 26,000. Imports from and exports to the United States in 1914, 8,650,000 and 10,523,000 colones respectively; United Kingdom, 2,341,000 and 11,166,000; Germany, 2,291,000 and 1,014,000; France, 646,000 and 266,000. In 1914 there were entered at Limón 438 vessels, of 967,668 tons; at Puntarenas, 80, of 185,646 tons.

COMMUNICATIONS. In 1914 Costa Rica had in operation 687 kilometers (431 miles) of railway, including branches and sidings, all of 3-foot 6-inch gauge. Of this mileage 69 miles (111 kilometers) is the property of the government, 141 miles (227 kilometers) belong to the Northern Railway Co., and 217 miles (349 kilometers) to the Costa Rica Railway. The Costa Rica Railway, however, is leased to the Northern, so that the whole system of some 358 miles (576 kilometers), having its focal point at Limón, is under one general management. Both these roads are well constructed, with steel and iron bridges, suitable stations, and sidetracks, and are maintained in good condition. Various branch lines have been extended up and down the coast for the service of the banana industry. The main line leaves Limón, passing through Matina, Siquirres, Turrialba, and Cartago, and reaching San José, at a distance of 103 miles (166 kilometers). The system is continued to Alahuela, 14 miles (23 kilometers) north of San José.

The Pacific Railway extends from San José to Puntarenas, on the Pacific coast, a distance of 69 miles (111 kilometers). The connecting link between Cascajal and El Roble, a distance of 12

miles (20 kilometers), was completed in 1910.

Telegraphs in 1914: Offices, 126, with 2447 kilometers of wire. A radiotelegraph station is in operation at Limón. Post offices, 204.

FINANCE. The standard of value is gold. The monetary unit is the colon, whose par value is 46.536 cents. Revenue and expenditure have been as follows, in colones:

	1911	1912	1913	1914
Revenue	9,707,269	9,950,672	9,612,534	8,601,690
Expend.	9,801,956	9,810,719	10,184,261	9,747,246

The budget for 1915 showed estimated revenue of 9,662,000 colones; estimated expenditure, 9,661,089. The largest estimated receipts were: Customs, 5,600,000 colones; liquor tax, 2,438,000. The largest expenditures are for the public debt, public instruction, and war and police. Public debt, Dec. 31, 1914, £1,586,660 and 30,000,000 francs.

GOVERNMENT. The President is elected for four years by indirect vote and is ineligible for the succeeding term. He is assisted by a Cabinet of six members. The Congress consists of a single chamber of 43 deputies, also elected indirectly. President in 1915, for the term beginning May 8, 1914, Alfredo González Flores. Vice-President, Domingo González.

HISTORY. Foreign Relations. The republic of Panama early in January repudiated the award of Chief Justice White of the United States Supreme Court on the question of the boundary between Panama and Costa Rica. The award was made under the Porras-Anderson convention of March 10, 1910. Late in January the United States began to negotiate a treaty to compensate Costa Rica for its rights in the interoceanic canal route in Nicaragua over which the United States is trying to gain control. It is understood that the United States will pay \$1,500,000 for an option on Costa Rica's rights. The United States has maintained since President Taft first broached the idea that the San Juan River, which would form the first part of the canal across Nicaragua, is one of the natural boundaries of Costa Rica, and, according to the protocols to which Nicaragua pledged itself at the time that the boundary line was fixed, Costa Rica must be consulted before any rights are surrendered. In August the government made arrangements with the Bankers Trust Company and the Irving National Bank, both of New York City, to open a credit account for nine months, such funds to be used exclusively for the payment of merchandise imported or to be imported into Uruguay. This arrangement was the first practical result of the Pan-American Financial Congress.

Internal Conditions. Early in May the government passed a law affording protection against injury to workmen in factories, shops, industrial establishments, mines, smelters, buildings, excavations, and agricultural industries. Señor Julio Acosta García was made secretary of foreign relations in July to succeed Señor Manuel Castro Quesada, who resigned to become minister to Washington. See INTERNATIONAL PEACE AND ARBITRATION.

COST OF LIVING. See PRICES.

COTTON. The cotton crop of the United States for 1915 was about 69 per cent of the record crop of 1914, when 16,134,930 bales of

500 pounds each were produced. On Dec. 10, 1915, the Bureau of Crop Estimates of the United States Department of Agriculture estimated the crop for 1915 at 11,161,000 bales, exclusive of linters, as compared with a five-year average (1909-13) of 13,033,235 bales. Shepperson's estimate of the crop of 1915 for the United States is 11,750,000 bales, including linters. The area planted to cotton in 1915 was 31,535,000 acres, or 15.7 per cent less than in 1914. The principal reason for the greatly reduced production was the demoralized condition of the cotton market following the outbreak of the war in Europe. The average price of cotton on Dec. 1, 1914, was only 6.8 cents per pound, and the seed brought about \$4.50 per ton less than the previous year. These conditions were quite general and resulted in a reduced planting in nearly all the important cotton-growing countries. The United States Bureau of the Census reported 10,643,783 running bales as already ginned to the end of 1915. This total includes 105,779 round bales and 88,921 bales of Sea Island cotton which, on account of their lighter weight, are counted as half bales. The Sea Island crop, which will probably nearly equal that of 1914, was ginned as follows: Florida, 27,803; Georgia, 55,531; and South Carolina, 5587 bales.

According to the United States Consular Reports, the Egyptian crop on Nov. 19, 1915, was estimated at 967,750 bales of 500 pounds. From the same source, a greatly reduced area planted to cotton in India is reported. The Russian crop was estimated to be 1,228,000 bales of 500 pounds each. An estimated crop of 2800 bales is reported in Japan.

The crop of the United States for 1914, the estimated crop for 1915, and the amount reported ginned to the end of 1915, exclusive of linters, by States were:

States	Crop, 1914 500 pound bales	Estimated crop, 1915 500 pound bales	Reported ginned, Jan. 1, 1916 Running bales
United States ..	16,134,930	11,161,000	10,643,783
Alabama	1,751,375	1,050,000	1,007,408
Arkansas	1,016,170	785,000	754,442
Florida	81,255	50,000	54,775
Georgia	2,718,037	1,900,000	1,907,098
Louisiana	449,458	360,000	322,575
Mississippi	1,245,535	940,000	800,646
North Carolina ..	930,631	708,000	697,072
Oklahoma	1,262,176	630,000	561,482
South Carolina ..	1,533,810	1,160,000	1,134,059
Tennessee	383,517	295,000	281,893
Texas	4,592,112	3,175,000	2,938,622
All other States ..	170,854	108,000	84,711

Of the States listed as "all others," Missouri in 1914 produced 81,752; Virginia, 25,222; and California, 49,835 bales. In 1915 these States are estimated to produce 52,000, 16,000, and 34,000 bales respectively. The crop of Arizona, where locally produced strains of Egyptian cotton are grown, was not expected to much exceed 2000 bales, owing to reduced acreage and unfavorable weather conditions at the beginning and end of the crop year.

The cotton crop of the United States for 1914, as finally reported by the Bureau of the Census, was 16,134,930 gross bales of 500 pounds each, of which 81,654 bales were Sea Island, the remainder various types of upland cotton. In addition there were produced 856,900 bales of linters, and 7,186,000 tons of seed, of which 5,-

779,665 tons were crushed for oil, cake, etc. The total value of the 1914 crop of the United States was \$720,080,000, as compared with \$1,026,700,000 for 1913. The Sea Island cotton production in 1914 was somewhat larger than the two preceding crops, and, from the preliminary announcements, that for 1915 will not show as great a reduction as the upland crop.

By agreement between cotton exchanges and statistical bodies at home and abroad, the cotton statistical year has been changed to end with July 31st, instead of August 31st, as formerly. On this account, data for different years are not strictly comparable.

The world's production of commercial cotton in 1914, that is the amount available for mill purposes, was approximately 24,764,000 bales of 500 pounds net weight, an increase of more than 2,500,000 bales over that of 1913. The contributions of the leading countries to the world's mill supply of cotton for 1913 and 1914, according to the United States Bureau of the Census Bulletin 131, were:

Country	1914	1913
	500 pound bales	500 pound bales
United States	15,433,000	13,545,000
India	8,326,000	8,692,000
Egypt	1,384,000	1,496,000
China	1,750,000	1,200,000
Russia	1,126,000	1,030,000
Brazil	440,000	420,000
Mexico	125,000	150,000
Peru	103,000	110,000
Persia	127,000	140,000
Turkey	120,000	130,000
All other countries....	825,000	285,000
Total	24,764,000	22,198,000

Reduced to percentages, the contributions of the leading countries to the mill supply in 1914 were: United States, 62.3; India, 15.4; China, 7.1; Egypt, 5.6; and Russia, 4.6 per cent.

The world's consumption of cotton for 1914-15 is estimated by the Bureau of the Census as 19,761,000 bales of 500 pounds net weight, of which the United States took 5,429,000, the United Kingdom 3,890,000, and Continental Europe 625,000 bales. In the United States, the cotton-growing States took 2,938,000 bales and the other States 2,491,000 bales. There were 141,500,000 active and idle spindles in the world in 1915, of which there were in the United States during November, 31,497,435 active spindles. There were located in the cotton-growing States at that time 12,801,204 active spindles, and in the other States, 18,696,231.

The estimated cotton supply of the United States for the year ending July 31, 1915, was 17,891,154 bales. Of this amount, there were exported, 8,322,688 bales; consumed by mills, 5,597,362 bales; and destroyed by fire, 35,000 bales, leaving 3,936,104 bales on hand at the end of the crop year. The greatest consumption of cotton in the United States was in Massachusetts, where 1,282,937 bales were used, with North Carolina second, taking 910,154 bales. The imports of cotton to this country for the year ending July 31, 1915, were 382,286 bales, the most of which was Egyptian cotton used for mercerizing and in the manufacture of thread, knit goods, and laces. During the same period 10,353 bales were imported from Peru, nearly all of which was rough Peruvian used for mixing with wool. The reexports were 18,691

bales, making the net importations 363,595 bales.

Detailed information regarding the crop of 1915 is meagre except for the United States. In India a reduction of about 22 per cent in the area planted is reported. An attempt is being made by the government and various coöperating agencies to improve the quality and yield of the Indian crop through the distribution of better seed and by demonstration experiments in many localities. In Egypt legislative restrictions resulted in the planting of about 1,230,000 acres, a reduction of over 400,000 acres. The pink bollworm is reported to have caused considerable loss in some localities. The Russian crop is reported as being quite satisfactory, increased plantings having been made in most of the larger producing provinces. The West Indian production does not appear to be increasing and it is quite possible that the crop of 1915 will show a reduction. In Africa, the purchases of the British Cotton Growing Association were less than in 1914. The purchases in Lagos to Sept. 30, 1915, were 5974 bales, as compared with 13,486 in the previous year. Nyassaland reports an increase in the value of exports amounting to \$32,816. The Uganda crop of 1914 was 21,428 bales, and the estimated crop in the Sudan for 1915 is placed at 24,000 bales. Production in Northern Nigeria has fallen off, only 497 bales having been purchased to the end of September, 1915. It has been decided to suspend the operations of the Association in the Gold Coast, Illushi, and Southern Nigeria. Successful efforts have been made to grow Egyptian cotton in Greece, especially in Messina and Thessaly. A rather extensive experiment in growing American upland cotton has been begun in Sicily. In Brazil, there has been organized a Cotton Service as a branch of the Ministry of Agriculture, and Dr. E. C. Green, for some years with the United States Department of Agriculture, has been placed in charge of the work. In Grenada, the destruction by fire of all cotton plants before the beginning of the next cotton season is required by recent enactment, on account of the presence of various pests.

The United States Department of Agriculture and the agricultural experiment stations throughout the cotton-producing section are continuing their efforts to bring about larger average yields and a better quality of staple, and some very suggestive results have been obtained. The new single-stalk system of cotton culture is said to be giving increased yields of from 40 to 121 per cent, as compared with common methods. The Durango cotton, which has been recently acclimatized from Mexico, is proving its superiority over other cottons in the Southwest, and recent investigations have shown its earlier character and other desirable qualities over Columbia for eastern cultivation. Through coöperative agreement between the Department of Agriculture and the experiment stations of South Carolina, Alabama, and Georgia, seed of valuable varieties of cotton resistant to root knot is being grown for distribution for 1916 planting. From extensive observations, it has been learned that run of the gin seed should not be used for planting where it is desired to perpetuate any particular variety of cotton.

The cotton boll weevil advance into new territory has been greater than for several years.

The average advance has been at the rate of about 50 miles per year, but in 1915 it spread in a northeasterly direction more than 100 miles, and it has finally reached the region of Sea Island cotton production. Most of the advance took place in the period from August 15th to August 31st, when a series of high winds prevailed. The pest was reported in Georgia in 1915 for the first time, 25 counties being infested. In Florida, 8 additional counties and 20 additional ones in Alabama were invaded. Owing to favorable weather conditions, boll weevils were more numerous in Texas in 1915 than for several years. On account of the discovery of living larvæ of the pink bollworm (*Gelechia gossypiella*) in cotton from Egypt, and the known occurrence of this and other pests in various countries, a quarantine has been established against the admission of cotton or cotton seed except under limitations. The shipment of cotton samples through the mails has been prohibited. After Feb. 1, 1916, the fumigation of all imported cotton will be required.

COTTON FUTURES ACT. The newly established Office of Markets and Rural Organization of the United States Department of Agriculture is charged with the administration of the Cotton Futures Act and various investigations arising under it. This law, known also as the Smith-Lever Law, was passed in August, 1914, and became effective February 18, 1915. While its operation included all cotton exchanges it was aimed primarily at the New York Cotton Exchange. It was the culmination of several years of agitation which became of public interest in 1907, when Congress requested the Commissioner of Corporations, Herbert Knox Smith, to investigate the causes of fluctuations in the prices of cotton and differences in the values of various grades. During the four years 1909-13 members of the New York Exchange had vigorously opposed the growing sentiment in Congress in favor of regulation; but in 1915 their attitude changed rather decisively so that even preceding the passage of the Smith-Lever Law they had decided to adopt government standards and monthly revision of grade differences. This action by the Exchange was taken November 17th and became effective on contracts maturing on and after April 1, 1915. The Cotton Futures Act imposed a tax of two cents per pound on all cotton sold on any exchange which did not conform to two essential conditions: (1) the cotton dealt in must be graded according to official standards of the Department of Agriculture; and (2) the relative difference in the value of various grades must be determined by averaging the quotations of actual transactions in each grade in various markets. The law further specified in detail certain requirements as to certificates of sale. An especially noteworthy provision was a tax of two cents a pound on all cablegrams to foreign exchanges unless such exchanges conformed as regards standard grades and rules of operation to the requirements of the law. This tax virtually prohibited transactions by Americans on the exchanges at Liverpool, Havre, and Bremen. The constitutionality of the law was contested in the Federal District Court at New York, with the result that on October 13th Judge Hough declared it unconstitutional. His contention was that the act was a revenue measure and hence should have originated in the House,

whereas it was first presented in the Senate. The government contended that it was not intended as a revenue act, and further that the tax features, which were purely incidental to the regulations which the act sought to impose, were added as an amendment in the House. Notice of appeal was given, as also notice that pending decision by the Supreme Court the act would be strictly enforced. The preparation and distribution of the new official standards of cotton for the United States, provided in the Futures Act, have been actively pursued, and 380 sets were distributed to June 30, 1915. The New York and New Orleans cotton exchanges adopted these standards for all transactions subsequent to Feb. 18, 1915. By June 30, 1915, 21 other organizations were using them.

CRANE, WALTER. English painter, designer, illustrator, and writer, died March 15, 1915. Born in 1845, he was privately educated. He served an apprenticeship with W. D. Linton, and in 1863 illustrated for his first book, *The New Forest*. He had previously exhibited in the Royal Academy. His talents as an illustrator and painter won him quick recognition, and from 1882 to 1886, when he resigned, he was a member of the Royal Society of oils and water color. He received numerous medals for illustrations, designs, and rural work. He illustrated many well-known children's books as well as several of Shakespeare's plays, and he designed the panels for the Women's Temperance Union building in Chicago, and the friezes for the gallery of the British Art Section at the St. Louis World's Fair. In addition to his work as an artist, he was an aggressive Socialist. Among his writings are: *An Artist's Reminiscences* (1907); *Indian Impressions* (1907); and *William Morris and Whistler* (1911). His work is represented in the principal galleries of London and elsewhere.

CREELMAN, JAMES. American editor and journalist, died Feb. 12, 1915. He was born in Montreal, Canada, in 1859, and was educated in the Canadian schools and at Talmage's Lay Theological College. In 1857 he became a member of the staff of the *New York Herald*, and acted as reporter, correspondent, and editorial writer for that paper. He was the editor of the London edition in 1890, and of the Paris edition 1891-92. In 1893 he was British editor of the *Cosmopolitan Magazine*. He acted as a correspondent for the *New York World* in the Japanese War of 1894. For the *New York Journal* he reported the Græco-Turkish War, 1897, the Cuban War, 1898, and the war in the Philippines in 1899, where he was severely wounded. In 1900-06 he did editorial work for the *New York Journal* and the *New York World*, and in 1906-10 was associate editor of *Pearson's Magazine*. He was appointed president of the Municipal Civil Service Commission of

New York City in 1911-12. In the latter year he became associate editor of the *New York Evening Mail*. He was a member of many societies, and wrote: *On the Great Highway* (1901); *Eagle Blood* (1902); *Why We Love Lincoln* (1908); and *Diaz, Master of Mexico* (1911).

CRETE (CANDIA). An island in the Mediterranean Sea; an autonomous state under the suzerainty of Turkey until May 31, 1913, when it was ceded to the Balkan powers, which formally recognized its union with Greece by the treaty of Bucharest, Aug. 10, 1913. Area, 3327 square miles; population (census of April 17, 1911), 344,001. Canea, the capital, has 25,185 inhabitants. Greek is the language of the people, a large majority of whom are Christians. The chief products for export are wheat and fruit, wool, soap, olive oil, carobs, vellonea, and cheese. The trade (mostly with Greece and Turkey) amounted in 1910 to 19,650,000 drachmas imports and 17,477,000 drachmas exports; in 1911, 21,359,000 and 15,631,000. Revenue and expenditure in 1910, 6,465,760 and 7,308,632 drachmas; in 1911, 6,518,594 and 6,792,829. Debt in 1912, 4,615,709 drachmas. A Governor-General (Loukas Roufos Kanakaris) was appointed Oct. 12, 1914.

CRICKET. The European war for the second year in succession prevented any international cricket matches. The sport in the United States, however, gained greatly in popularity. The Germantown Club carried off the honors by capturing the Halifax Cup after a close struggle with the New York team, which for the first time was a competitor. F. Greene of the Germantown Club won the Childs Bowling Cup with a record of 28 wickets at an average of 11.71. The Childs Batting Cup went to B. Kortlang of New York with an average of 65.16 for eight innings.

The Metropolitan League pennant was captured by the Manhattan Club which scored 10 victories in as many matches. L. Miller of the Manhattans won the league batting prize, his average being 44, and F. S. Hall of the same club proved to be the best league bowler. Bensonhurst took the championship of the New York and New Jersey Cricket Association, conquering Manor Field in the last contest of the season. The batting crown of the association went to R. Comacho of Manor Field and the bowling laurels to H. B. H. Boyce of Bensonhurst.

The death of William Gilbert Grace, known throughout the world as the king of cricket, occurred during the year.

CROFFUT, WILLIAM AUGUSTUS. American author, died July 31, 1915. He was born in Reading, Conn., in 1835; was educated in the common schools; and in 1852 engaged in newspaper work, leaving this to enlist in the Union army, in which he served throughout the Civil War. At its close he became a reporter and correspondent for newspapers. At different times he was editor of the *Minneapolis Tribune*, the *New York American*, and other papers. From 1888-94 he was executive officer of the United States Geological Survey. He organized and became secretary of the Anti-Imperialistic

League in 1899. He was the author of many books, including: *War History of Connecticut*, *The Open Door of Dreamland*, *Fifty Years in Camp and Field*, and the *Crimson Wall*, a novel. He also published several volumes of verse, and wrote the *Opening Ode* for the Chicago Exposition in 1893.

CROPS. See article AGRICULTURE, and section *Agriculture* under various countries and States of the United States.

CROSBY, FRANCES JANE VAN ALSTYNE, better known as "Fanny" Crosby. American hymn writer, died Feb. 12, 1915. She was born at Southeast, N. Y., in 1820. When she was six years of age she became blind from an illness. Some years later she entered an institution for the blind in New York City, and was a teacher of English grammar, rhetoric, and literature in that institution from 1847-58. She wrote the words for many songs of George F. Root. Her first hymn was written for William B. Bradbury. She wrote in all more than 6000 hymns, several of which are well known. She also wrote secular songs, including *There's Music in the Air*, and *Hazel Dell*, and was the author of the *Blind Girl and Other Poems* (1844), *Monterey and Other Poems* (1849), *Bells at Evening and Other Poems* (1898), and *Memories of Eighty Years* (1906).

CUBA. An island republic of the West Indies. The capital is Havana.

AREA, POPULATION, ETC. The following table shows the area by provinces and the population according to the census of Sept. 30, 1907, and the estimate of June, 1913:

	Square miles	Population 1907	1913
Pinar del Río.....	5,164	240,372	257,898
Havana	2,772	538,010	651,266
Matanzas	3,700	239,812	270,483
Santa Clara	9,560	457,431	567,277
Camagüey	10,500	118,260	154,567
Oriente	12,468	455,086	567,664
Total	44,164	2,048,980	2,469,579

Population according to race in 1907: Native whites, 1,224,539; foreign whites, 203,637; colored, 620,804 (of whom, 274,272 negroes, 334,695 mulattoes, 11,837 Chinese). Immigration during the year ended June 30, 1913, 58,036; 1914, 40,530 (32,576 males, 7954 females); of the total in the latter year, there were 31,821 Spaniards, 2515 Jamaicans, and 1152 North Americans. The larger cities, with population in 1907, are: Havana, 297,159; Santiago de Cuba, 45,470; Matanzas, 36,009; Cienfuegos, 26,616; Cárdenas, 24,280.

According to the 1907 census, about 31 per cent of the population could not read. As reported for 1914, there were 2344 public school houses, with 4333 teachers, and 277,013 pupils enrolled; average attendance, 120,263. The government maintains a secondary school in each province; total students in 1914, about 1500. There is a State university at Havana, with about 1300 students.

PRODUCTION AND COMMERCE. The staple ag-

ricultural products are sugar and tobacco. Other crops are cacao, potatoes and other vegetables, cereals, and fruits, especially pineapples, bananas, oranges, and coconuts. Cuba and British India are the two most important producers of cane sugar in the world. Cuba's production of tobacco is not so great as that of some other countries, but it leads all others in the output of tobacco which is suitable for fine cigars. Stock raising is important. There are large mineral resources, especially in Oriente, including iron, manganese, copper, lead, zinc, gold, and salt.

Imports and exports respectively have been valued as follows in fiscal years ended June 30, 1910, \$163,446,127 and \$144,039,483; in 1911, \$108,098,000 and \$129,179,000; in 1912, \$120,229,317 and \$146,787,295; in 1913, \$135,810,000 and \$165,208,000; in 1914, \$134,008,138 and \$170,796,851. The leading imports include breadstuffs, meats, cotton goods, iron and steel, and machinery. The following table shows the principal exports:

	1911-12	1912-13	1913-14
Sugar, raw...	\$101,542,170	\$110,856,715	\$119,742,942
Tobacco, unmd.	17,895,525	21,649,893	19,007,213
Tobacco, mfd.	18,061,862	18,918,650	18,775,202
Iron ore.....	3,174,648	4,238,321	3,897,159
Cattle hides..	1,654,459	2,382,790	2,530,132
Molasses	1,387,893	1,977,082	2,429,361
Pineapples ..	1,117,709	1,317,687	1,286,503
Bananas	873,092	817,028	1,026,825
Copper ore...	576,870	599,477	865,662
Spirits	554,922	665,478	532,103
Honey	476,407	509,225	517,778
Cacao	294,242	535,077	507,011
Bees' wax...	345,658	346,819	356,630
Sponges	800,273	295,534	308,782

The quantity of raw sugar exported in the fiscal year 1914 is reported at 4,896,430,625 pounds; molasses, 54,734,060 gallons; refined sugar, 38,991,048 pounds; unmanufactured tobacco, 42,784,831 pounds. Trade by countries, in thousands of dollars:

	1912-13	1913-14	1912-13	1913-14
	Imports		Exports	
United States ..	\$71,754	\$71,420	\$182,581	\$186,986
U. Kingdom....	17,411	15,619	15,668	18,245
Spain	10,228	10,588	692	1,100
Germany	9,515	8,276	6,498	4,486
France	8,237	8,257	1,326	2,652
Porto Rico		2,988		49
British India...		2,897		2
Belgium		2,637		562
Uruguay		1,714		343
Canada	1,499	1,665	2,920	2,066
Argentina		1,458		972
Norway		1,420		927
Total, including other	\$185,810	\$184,008	\$165,208	\$170,797

COMMUNICATIONS. The length of railway in operation in 1913 is stated at 3806 kilometers (2365 miles). Telegraphs in 1912: 215 offices, 8151 kilometers of line, 9952 kilometers of wire. The government operates nine radiotelegraph stations. Post offices in 1912, 574.

FINANCE. Under a law of Nov. 7, 1914, a new coinage was introduced Dec. 1, 1915. The monetary unit is the gold peso of 1.6718 grams (1.5046 grams fine), equivalent to the American dollar. Gold coins minted are the 20, 10, 5, 4, 2, and 1 peso pieces. Silver coins are the 10, 20, and 40 centavo pieces and the peso. Nickel coins are 1, 2, and 5 centavo pieces. Gold coinage is unlimited. The American coinage continues to be a legal tender.

For the fiscal year ended June 30, 1915, the budget showed estimated revenue of \$41,828,580 and estimated expenditure of \$40,262,906. This budget was continued for the ensuing fiscal year. Estimated customs receipts were \$29,100,000; consular dues, \$670,000; receipts from posts and telegraphs, \$1,000,000; direct taxes, \$1,113,000; excise, \$3,600,000; lottery, \$3,200,000; other receipts, \$3,145,580. The larger estimated disbursements: administration (interior), \$11,042,249; public instruction, \$5,196,421; public debt, \$4,457,963; sanitary service, \$4,264,388; finance, \$3,280,318. The actual customs receipts reported for the year 1913-14 were \$27,665,108, as compared with \$28,174,123 in 1912-13 and \$25,508,895 in 1911-12. Public debt, Jan. 1, 1914: Foreign, \$57,420,000; internal, \$10,408,000; total, \$67,828,000.

GOVERNMENT. The executive authority is vested in a President, who, with a Vice-President, is elected by indirect vote for four years. There is a Congress of two houses: the Senate consists of 24 members (four from each province), elected indirectly for eight years; the House of Representatives consists of 83 members, elected by direct vote for four years. The President is assisted by a Cabinet of eight members. On May 20, 1913, Gen. José Miguel Gómez was succeeded as President by Gen. Mario García Menocal for the four-year term. Vice-President, Dr. Enrique José Varona.

HISTORY. *Political Conditions in Cuba.* Early in January members of the lower house of the Cuban Congress brought charges of misappropriation of public funds against Secretary of the Treasury Cancio. The members claimed that the loan which Cuba had negotiated through J. P. Morgan and Co. of New York would amount to \$10,250,000, whereas the loan bill passed by Congress allowed for a total of only \$10,000,000. The legislative branch of the government won a victory over President Menocal early in February when they repassed the Amnesty Bill over the chief executive's veto. The Amnesty Bill provided specially for the release of Gen. Ernesto Asbert, former Governor of Havana Province, convicted in June, 1914, of killing Gen. Armando Riva, chief of the National Police. There were great celebrations throughout Havana when it was known that Asbert would be released. On February 15th—the 17th anniversary of the destruction of the *Maine* in Havana harbor—President Menocal asked Congress for an appropriation of \$23,000 with which to build a commemorative monument to the victims of the disaster. The United States Department of Commerce announced on March 18th that the Cuban decree, promulgated on Nov. 7, 1914, which authorized the granting of a bounty on raw tobacco and on cigars manufactured in Cuba and shipped direct to foreign countries, had not been enforced and would not be put into effect. Señor Enrique Mazas, editor of *La Tribuna*, was arrested in May, charged with having libeled the President of the republic in an article demanding that Menocal resign either as general inspector of the Chaparra Sugar Company or as President of the republic. An executive decree in July extended the budget for 1914-15 for another year, Congress having taken no action on the matter, and another decree in August lengthened for four years the contract between the government and the National Bank of Cuba, at the same time

reducing the bank's commission to one-eighth of 1 per cent.

Foreign Relations. On May 20th, the 13th anniversary of the independence of Cuba, President Wilson sent a congratulatory message to President Menocal of Cuba. The message read: "It gives me great pleasure to extend to your Excellency and to the Cuban people cordial greetings on this anniversary of the independence of Cuba." Cuba appointed on May 21st Señor Octavio A. Zayas, a private banker, to represent the republic at the Pan-American Financial Congress which convened on May 24th. In June the Department of Foreign Relations of the Cuban Republic announced that it proposed to secure the authorization by Congress of the erection of a magnificent legation building in Washington.

CUMBERLAND PRESBYTERIAN CHURCH. The work of this denomination in 1915 steadily progressed, notwithstanding the fact of litigation which resulted in 1913 in the surrender of the Church's publishing house in Nashville to the Presbyterian Church in the United States. The books, plates, and periodicals were saved, and shortly afterward the members of the denomination subscribed \$12,500 to purchase machinery for a new publishing plant. As a result the *Cumberland Presbyterian*, the denomination's weekly journal, was continued, and also the issue of its Sunday school periodicals and literature. There was nothing notable in litigation during 1915. The Church increased in membership. The greatest enterprise before it in that year was the conduct of a campaign for placing a Sunday school library of the denomination's doctrinal books in every Sunday school, and also for the getting of every member of the denomination to possess and read the gift edition of *Why I Am a Cumberland*. The slogan of the Church in 1915 was "Indoctrinate." According to the latest available returns the denomination has 122,000 communicants, 929 ministers, and 1600 churches.

CURACAO. A Dutch West Indian colony, 436 square miles, composed of the islands of Curaçao (212 square miles), Bonaire (Buen Ayre), Aruba, St. Eustatius, and Saba, and part of the Island of St. Martin. Total population, Dec. 31, 1910, 54,469 (24,297 males, 30,172 females); Dec. 31, 1913, 55,183. Export of phosphate in 1911: Curaçao, 3028 cubic meters; Aruba, 27,658 (in 1912, 28,392). Raw gold export in 1911 (Aruba) was valued at 113,115 guilders; in 1912, 84,561. Total imports (1910), 3,162,310 guilders, exports, 1,121,105; 1912, 3,890,123 and 2,425,541. Vessels entered 1912, 1428 of 2,713,000 cubic meters capacity, at Curaçao, and 1745 of 184,000 at ports of other islands. The budget for 1914 showed estimated revenue of 711,234 guilders; expenditure, 1,193,428; subvention, 482,194; for 1915, revenue, 732,079; expenditure, 1,162,669; subvention, 430,590. Dr. Th. I. A. Nuyens was Governor in 1914.

CURRENCY. See BANKS AND BANKING; COINS, VALUE OF; FINANCIAL REVIEW.

CUSHING CASE. See UNITED STATES AND THE WAR.

CYCLING. Frank L. Kramer in 1915 won the professional cycling championship for the 14th consecutive year, riding on the board track at Newark, N. J. Alfred Goulet of Australia tied with Kramer in the season's point total,

but was defeated in two heats of a series of three match races at five miles.

Kramer also distinguished himself by setting many new records for the shorter distances. The showing of the Australasian riders—Goullet, Grenda, McNamara, and Spears—makes it probable that when Kramer does relinquish his crown as cycling king it will be placed on the brow of one of these marvelous wheelmen.

Among the amateur riders, Ernest Ohrt was in a class by himself, winning the championship competition and also making the fastest time ever made by an amateur for the mile, starting from scratch. Ohrt's time was 1 minute, 53½ seconds.

The annual six-day race at Madison Square Garden, New York City, was won by Alfred Grenda of Tasmania and Fred Hill of Boston, Mass., a new world's record of 2770 miles and eight laps being made. Robert McNamara and Robert Spears, both of Australia, finished second. Goullet, who, teamed up with Grenda, captured this event in 1914, was not entered.

CYPRUS. An island in the easternmost basin of the Mediterranean, until 1914 nominally a part of the Ottoman Empire, but ceded for administrative purposes to Great Britain in 1878. In November, 1914, it was annexed by Great Britain. It has an area of 3584 square miles, and its population by districts (1911) is as follows: Nicosia, 81,497; Famagusta, 58,530; Larnaca, 29,737; Limassol, 46,084; Paphos, 38,508; Kyrenia, 19,752; total, 274,108. Estimated population at the end of 1913, about 287,000. Mohammedans form about 25.9 per cent of the population, the remainder being nearly all Christians of the native Cypriote Church. Nicosia, the capital, had, in 1911, 16,052 inhabitants. Elementary schools of all classes, in 1914, 610 (414 Christian, 196 Mohammedan), with 739 teachers and an enrollment of 33,805 (27,685 Christians and 6120 Mohammedans).

Agriculture, the chief industry, has been greatly retarded by reason of the lack of water; the rivers, nearly all mountain torrents, dry up in summer, and the rainfall is deficient. A plan for storing water for irrigation is in process of realization. The large numbers of goats, together with frequent forest fires, are a hindrance to the development of valuable forests. Cereals, carobs, the famous Cyprus wine, cheese, fruit, vegetables, and live stock are exported. In 1913 there were about 67,700 horses, mules, and asses; 60,500 cattle; 265,500 sheep; 255,200 goats; and 37,000 swine. The imports in 1913 were valued, exclusive of specie, at £619,338 (from Great Britain, £171,712; from British colonies, £6196; from other countries, £441,430); the exports at £620,591 (to Great Britain, £120,713; to British colonies, £6249; to other countries, £493,629). Shipping entered and cleared (1913), 721,515 tons. Revenue (1913-14), £341,816; expenditure, £296,165. A sum of £92,800 was payable annually to Turkey, but this is appropriated to the interest on the guaranteed loan of 1855. British high-commissioner in 1915, Sir John E. Clauson.

HISTORY. In reply to the memorial which the Greek Cypriotes had submitted to the British government in 1914 (see *YEAR BOOK*, 1914) asking for union with Greece, the High Commissioner handed to the Greek archbishop, Cyril, Jan. 4, 1915, a curt acknowledgment of the receipt of the memorial, without the slightest con-

cession to the nationalist aspirations of the petitioners. In delivering this brusque rebuke, the High Commissioner explained orally that the population was not unanimous in desiring affiliation with Greece, and that the Turkish element on the island had actually submitted a petition in favor of the continuance of British rule. Local journals, however, pointed out that the element of the population favorable to British rule constituted but a small minority; and in some quarters it was suggested that a more favorable attitude towards the Hellenic Cypriotes would have been more in keeping with Great Britain's rôle as protector and liberator of small nations. In October, the British government offered to cede Cyprus to Greece if the latter would lend her aid in the operations against Great Britain's enemies (see *GREECE, History*). As Greece was unwilling to pay the price, however, the offer lapsed.

CYRENAICA. See *LIBYA*.

CZAPLICA, MISS.—HER EXPLORATIONS. See *EXPLORATION, Asia*.

DACIA CASE. See *U. S. AND THE WAR*.

DAHOMÉY. A French West African colony; one of the component parts of the government-general of French West Africa (q.v.). A recent estimate of population is 910,902, of whom 809,402 fetishist, 75,000 Mohammedan, 20,064 Roman Catholic, and 6500 Protestant. Capital, Porto Novo, with 40,000 inhabitants; other towns are: Abomey (12,372), Ouidah, or Whydah (13,000), Grand Popo (2115), and Cotonou (2456). The principal products for export are palm kernels (export in 1912 valued at 13,398,416 francs, in 1909 at 8,353,252), palm oil (6,361,320 and 6,452,100), dried fish (304,670 in 1912), live animals (155,713 and 151,378), corn (325,036 and 712,713), copra (105,263 and 99,420), cotton, kola nuts, etc. Imports and exports for 1912 were valued at 20,310,098 and 21,451,317 francs, respectively. A railway (722 kilometers), which, when completed, will connect Cotonou with the Niger at a point near Karimama, is finished as far as Savé (261 kilometers). The line has three main sections: Cotonou to Paouignan, 194 kilometers; Paouignan to Parakou, 246; Parakou to the Niger, 250. A branch from Cotonou (32 kilometers) runs to Ouidah and Segboroué. Ch. Noufflard was lieutenant-governor in 1914.

DAIRY FARMING. See *DAIRYING*.

DAIRYING. SUPPLY OF DAIRY PRODUCTS. The increase in the value of dairy products in the United States was hardly commensurate with the increased consumption and export demands which characterized the trade in 1915. There appeared to be a marked shortage of milk in New England and New York, due probably to a shortage of cows in that section, while the Middle West remained about normal. The dairy industry of the country suffered by reason of the spread of the foot-and-mouth disease, which, however, at the end of the year was under control as a result of the vigorous policy of eradication followed. Fortunately, the National Dairy Show herd of 700 head were saved by a most thorough and complete quarantine from which they were released in May (see also *VETERINARY MEDICINE*).

It was estimated by the United States Department of Agriculture that the average per capita milk consumption in cities of 2500 inhabitants or over was 112 quarts per year, and was

slightly higher in cities of 25,000 or over than in smaller cities. There was apparently less variation in milk consumption by months in the large cities than in the small ones, the fluctuations being less than 10 per cent. Investigations made by the New York Cornell Experiment Station showed that milk was being produced in that section at a net cost of \$1.21 per 100 pounds, and butter fat at 33.3 cents per pound. The average profit realized was 31 cents per 100 pounds, and the net profit per cow was \$20.39. The average cost of feed per cow was \$51.57, and the labor cost \$23.12. The profit from cows yielding 10,000 pounds per year of milk was 51 per cent greater than from those yielding 6000 pounds.

The cow testing associations were on a firmer footing than they had been in previous years. Many new associations were organized through the efforts of the Department of Agriculture and the extension divisions of the agricultural colleges. The results of these associations were highly satisfactory, many of the herds under their control making notable gains in yields, due to the elimination of inferior cows and the adoption of the most approved methods of feeding and management.

The spirit of coöperation has been especially evident in Wisconsin within recent years. There were in 1915 over 1500 farmers' companies in that State, of which 347 were creamery organizations, 290 cheese factories, and 35 live stock shipping associations. In point of number and the money handled the dairy enterprises exceeded all other coöperative agencies. The Wisconsin Station reported that approximately half of the cheese of the United States was made in that State. Two-thirds of this was American and the remaining one-third was Swiss, brick, and Limburger. Many fancy varieties were produced but they were of little commercial importance. Since 1909 the production had been decreasing in other leading States and increasing in Wisconsin. More than half of the cheese factories were coöperative. It appeared that a great portion of the middleman's charges in marketing cheese were legitimate, and for the present, necessary.

Notable dairy records for the year were as follows: The Holstein cow, Duchess Skylark Ormsby, completed a year's record of 27,761 pounds of milk containing 1205 pounds of fat. The Holstein cow, Finderne Pride Johanna Rue, made a record of 28,403.7 pounds of milk and 1176.47 pounds of fat in one year. The 3-year-old Holstein Frisian heifer, Finderne Holingen Fayne, produced 24,612.8 pounds of milk containing 1116.05 pounds of fat. The 10-year-old Guernsey cow, Murne Cowan, completed a year's record of 24,008 pounds of milk containing 1098.18 pounds of fat.

Announcement was made of the formation of the American Milking Shorthorn Breeders' Association, with headquarters at St. Paul, Minn. Animals will be registered as foundation stock until the end of 1918 under certain conditions.

EXPORTS AND IMPORTS OF DAIRY PRODUCTS. Cheese, butter, and butter fats were again becoming important factors in the United States export trade after a long period of comparative inactivity. Butter usually averaging about 3,500,000 pounds annually in the export trade, in the fiscal year 1915 went to nearly 10,000,000 pounds. During this period imports of butter were reduced by more than one-half, falling from

a little less than 8,000,000 pounds in 1914, to less than 4,000,000 pounds in 1915. American cheese, running at about 2,500,000 pounds a year, went to 54,000,000 pounds in the fiscal year 1915. Here also, as in the case of butter, the trade balance was transferred to the export side, for the year's imports of cheese last year totaled only 50,000,000 pounds, a decrease of 13,750,000 pounds from the total for 1914.

England became the largest foreign market for American butter, cheese, and condensed milk, having taken 3,333,000 pounds of butter, 48,500,000 pounds of cheese, and 4,000,000 pounds of condensed milk from the United States. Canada, Cuba, Panama, Australia, and Venezuela also took considerable quantities of American butter. Panama and the West Indies are important markets for cheese. American condensed milk was being exported in record-breaking amounts, with sales aggregating 37,235,627 pounds in the fiscal year 1915, against less than one-third that amount in 1911. Cuba led among the foreign markets for this American product, while very large amounts were sold in the Orient, chiefly Japan, China, and the Philippine Islands.

The war has diverted large quantities of Canadian butter and cheese to England that would otherwise have sought a market in the United States, eleven months' imports of butter being but 3,721,224 pounds, against 7,640,995, and of cheese 46,561,251 pounds, against 58,778,538 pounds last year. Italy and Switzerland were the leading sources of the cheese imported into the United States, having supplied in 1915 26.5 million and 22.5 million pounds, respectively, as against nearly 5.5 million from France, 3½ million from the Netherlands, 3.25 million from Greece, 1 million pounds from Canada, and smaller amounts from Norway, Germany, England, and Austria-Hungary.

DAIRYING IN FOREIGN COUNTRIES. Census reports of food supplies in Australia showed that from 30 to 40 per cent of the dairy cattle in that country were lost in consequence of drought, and that with the limited milk supply an output of only 13,000,000 pounds of cheese could be expected for 1915. The annual consumption in Australia was in excess of 18,000,000 pounds. There was likewise a serious shortage of butter, and while there was probably ample for home consumption, very little butter would be available for export. Australia was forced to become an importer instead of an exporter of butter. Large shipments were being made by American concerns.

The dairy industry in New Zealand had become an important factor in the prosperity of that country. At the close of the year ended April 30, 1915, there were 167 public creameries, 330 public cheese factories, 64 private creameries, and 24 private cheese factories in operation. Large exports of cheese and butter were being made from that country, Canada and the United States being the principal consumers.

The production of milk, butter, and cheese by dairy farmers in Glasgow and the west of Scotland showed a decided increase since the beginning of the war. Formerly the tendency was in many cases toward producing milk alone. The war, however, brought a rise in the prices of milk, butter, and cheese, particularly of cheese. The total value of the exports of condensed milk from Switzerland increased in value from \$8,529,634 in 1913, to \$9,151,674 in 1914. The

general situation in the condensed milk industry in 1914 was comparatively favorable. The reduced production of milk in Switzerland, due to a shortage of feed crops, and subsequently the difficulty in procuring sugar, threatened to curtail the condensed milk and certain other Swiss food products industries. See also AGRICULTURE.

LITERATURE. Among the important publications that appeared during the year were the following: *Proceedings of the 6th, 7th, and 8th Annual Conferences of the American Association of Medical Milk Commissions, 1912, 1913, and 1914* (Cincinnati, Ohio, 1915); W. A. G. Pennington, *Science of Dairying* (London, 1915); S. H. Ayers and W. T. Johnson, Jr., "Ability of Colon Bacilli to Survive Pasteurization" (*U. S. Department of Agriculture, Journal of Agricultural Research, February, 1915*); C. Thom and R. H. Shaw, "Moldiness in Butter" (*U. S. Department of Agriculture, Journal of Agricultural Research, January, 1915*); G. L. A. Ruehle and W. L. Kulp, "Germ Content of Stable Air and Its Effect upon the Germ Content of Milk" (*New York State Station Bulletin 409*); B. H. Hibbard and A. Hobson, "Markets and Prices of Wisconsin Cheese" (*Wisconsin Station Bulletin 251*); J. D. Brew, "Milk Quality as Determined by Present Day Score Cards" (*New York State Station Bulletin 398*).

DALLES-CELILO CANAL. See CANALS.

DAMS. One of the most important engineering questions under discussion in 1915 was the construction of dams for power development across rivers under the control of the Federal government. It was claimed that existing legislation seriously curtailed hydroelectric development that would be of direct benefit to many persons, and in his annual report for 1915, Secretary of War Garrison pointed out that the national general dam act had prevented the development of water power on navigable streams and characterized the law as a "makeshift which effectually prevents all development." Referring to it specifically, he stated:

"The general dam act does not offer the rightful and necessary inducement for an economical and profitable development, nor on the other hand would it adequately protect the interests of the public if development were possible under it. It is a general dam act in name only; while purporting to lay down general conditions to cover development in all cases, it nevertheless requires in each case the further special authorization of Congress, which made of each application an independent legislative proposition, and subjected each project to the delay and hazard of congressional action."

The Secretary also pointed out that the usual use of electric power, in cities and in factories, was not the only outlet for hydroelectric energy, and instanced the fact that the fixation of atmospheric nitrogen, through the use of the electric furnace, offers a tremendous field for the use of cheap power—a matter of particular importance at a time when nitrogen for explosives is so important a factor in military effectiveness. He urged that Congress enact suitable legislation along the lines of that which failed to pass in the Congress of the previous year.

The Arrowrock Dam, across the Boise River just above Boise, Idaho, the highest dam in the world, was officially dedicated on October 4th. This dam is 348.5 feet in height from the lowest

point of the foundation to its parapet, and is about 250 feet above the river bed. It is arched in plan to a 662-foot radius. The section is the normal gravity type. The length at the top is 1100 feet, and the width at that point 16 feet. At the base it is 240 feet thick. The total amount of concrete reached 610,600 cubic yards. The excavation amounted to 683,000 cubic yards. It was completed nearly two years ahead of time at a saving of more than \$2,500,000 on the original estimate. It is a part of the Boise project of the United States Reclamation Service, which embraces an area of 240,000 acres.

Work continued during the year on the Elephant Butte Dam described in the 1914 YEAR BOOK, and on Sept. 1, 1915, 560,000 cubic yards of masonry had been placed, leaving about 50,000 cubic yards to complete the structure, which was virtually finished by the end of the year, so that sometime in 1916 it would be ready for use. This dam is built of rubble concrete masonry with a smooth concrete face, and local conditions introduced many interesting problems.

During the year further progress was made on the Calaveras Earth Dam for the Spring Valley Water Company, of San Francisco. This dam, when completed, will be the highest earth dam in the world, with a crest of 240 feet above bedrock, and containing over 3,000,000 cubic yards of material. The dam was being constructed by the hydraulic process and by means of material placed on the lower slopes by teams loaded by steam shovels. The dam is located in a narrow valley with steep hills on either side, and as the earth on the slopes was not well suited to hydraulic excavation and placing, much of the material required had to be carried in a pipe line for a considerable distance in order to reach suitable earth. The Calaveras reservoir when completed was expected to increase the available water supply for San Francisco by 30,000,000 gallons per day, and would provide for considerable growth of the city, which now has a daily consumption of 45,000,000 gallons.

In 1915 progress was made on the cyclopean masonry dam which was being built near the present Holden reservoirs of the city of Worcester, Mass., to impound an additional water supply. This dam was to be 108 feet in height, from foundation to top, and 80 feet wide at base, and 17 feet wide at the top, which is 850 feet long. The dam closes the narrow outlet of a natural basin and is built on solid rock, so that a certain amount of the excavated material can be used in the dam masonry, while rock excavated near the dam site will be used for the concrete aggregates, and for making sand as well as the coarser concrete, two sand rolls having been installed. This work was being done by municipal labor, with small annual appropriations, and is estimated to cost about \$700,000.

The reservoir formed by the Roosevelt Dam across the Salt River in Arizona was filled to the dam crest for the first time on April 14th, and water passed over the spillway. This dam was 280 feet high above bedrock, 1080 feet long (including spillways), and the reservoir has a capacity of 1,400,000 acre feet.

The year saw also the completion of the Lahontan Dam of the Truckee-Carson irrigation project in Nevada. This earth embankment was 124 feet high, and supplied 290,000 acre feet of water for irrigation. It is across the Carson River, near Fallon and Hazen, Nev. The struc-

ture cost about \$1,500,000, and is unique in possessing twin spillways 250 feet long at either end of the dam, with a combined normal discharge capacity of 30,000 second feet, which converge on a circular pool 230 feet in diameter. There is also a reinforced concrete outlet tower with two cylindrical hydraulically balanced valves. In its construction there was involved an electrically operated plant and also a sand cement plant. For an earth embankment the Lahontan Dam presents many striking and interesting features.

The Great Falls Dam on the Missouri River near Great Falls, Mont., was dedicated August 11th, when water passed over the crest of the dam. The improvement of the Ohio River involves construction of a number of dams, and Dam No. 10, at Steubenville, Ohio, was completed November 4th, and locks placed in operation on that date.

One of the dam failures during the year was the Lyman Dam, an earth dike across the main channel of the Little Colorado River, about 12 miles south of St. Johns, Ariz. This dike was 450 feet long on the bottom, and 65 feet on the crest, 65 feet high, with a 12-foot crest, and a slope of 2.1 on both sides, and contained 200,000 cubic feet of material. The reservoir which it formed had a capacity of about 40,000 acre feet, being the next in size in Arizona to the Roosevelt reservoir. The dam failed on April 14th, and the reason assigned for this was that a portion of the dike across the channel below the outlet conduit did not have an opportunity to dry out properly and therefore was materially weak.

As in other States, Pennsylvania requires the consent or permission of the Water Supply Commission previous to the construction or change of any dam for power or other water obstruction, and during 1915 rules of inspection were issued by the commission to aid its engineering department and for the guidance of those intending to construct dams. With each application plans and specifications were required, including a location plan or map, a general plan of the dam and reservoir, a longitudinal section, typical cross section, detailed plans of the spillway, and other works, diagrams of forces, and their stresses acting on the structure. In Colorado also there is State supervision of reservoirs, and detailed regulations and specifications are provided for construction. While in Colorado there have been a number of failures of reservoir dams, it has been found that in practically every case there has been inadequate investigation of the foundation of the dam and of the materials used in it.

DANBURY HATTERS' CASE. See BOYCOTT.

DANISH LITERATURE. See SCANDINAVIAN LITERATURE.

DANISH WEST INDIES. Three West Indian islands (Saint Croix, 84 square miles, 15,467 inhabitants in 1911; Saint Thomas, 33 and 10,678; Saint John, 21 and 941), which compose a colony of Denmark. Negroes form the majority of the population, and the cultivation of sugar-cane is the chief industry. The sugar export from Saint Croix in 1911-12 was 10,023 metric tons; in 1912-13, 6063; in 1913-14, 5825. In 1913-14, the export of rum from Saint Croix was 86,957 gallons; cotton, 161,539 kilograms; cotton seed, 277,144 kilograms. Gover-

nor, L. C. Helweg-Larsen; government seat, Charlotte Amalie (Saint Thomas).

DARTMOUTH COLLEGE. An institution for higher education, founded in 1769 at Hanover, N. H. The total enrollment in all departments in the autumn of 1915 was 1470. The faculty numbered 142, which includes also officers of administration. During the year Prof. James L. McConaughy was appointed head of the department of education and director of the summer session; Dr. Philip Greeley Class, director of music; Henry T. Moore, assistant professor of psychology, in place of Walter Van Dyke Bingham; Herbert E. Cushman, lecturer in philosophy. No notable benefactions were received during 1915. The productive funds at the end of the fiscal year amounted to \$3,861,717, and the income to \$392,768. The library contained 135,000 volumes.

DEATH RATE. See VITAL STATISTICS.

DEFECTIVES. See CHARITIES, *passim*.

DE GOURMONT, RÉMY. See FRENCH LITERATURE, *Literary Events*.

DEGREE, Ph.D. in GERMAN UNIVERSITIES. See PHILOLOGY, MODERN.

DELAFIELD, FRANCIS. American physician, died July 17, 1915. He was born in New York City in 1844, and graduated from Illinois College in 1860. He studied medicine at the College of Physicians and Surgeons, and received the degree in 1872. After post graduate work in London, Berlin, and Paris, he began practice in New York City. His investigation of the problems of medicine soon gave him a recognized place among the original workers of the day, particularly as a pathologist. He was appointed surgeon at the New York Eye and Ear Infirmary, and pathologist to the Roosevelt Hospital in the same year. In 1871 he joined the staff of Bellevue Hospital, and a year later became adjunct professor of medicine in the College of Physicians and Surgeons. Two years later he was elected to the chair of the theory and practice of medicine. From 1901 until his death he was professor emeritus. He was the first president of the Association of American Physicians. While professor of the College of Physicians and Surgeons, he founded and himself supported for some time the first pathological laboratory in the United States. He was called to Buffalo in consultation after the shooting of President McKinley. He received degrees of LL.D. from Illinois and Columbia universities. His writings include: *Hand Book of Post Mortem Examinations and Morbid Anatomy*; *Manual of Physical Diagnosis*; *Diseases of the Kidneys*; and *Handbook of Pathological Anatomy and Histology* (with Dr. T. M. Pruden).

DELAND, MARGARET. See LITERATURE, ENGLISH AND AMERICAN, *Fiction*.

DELANY, JOHN JOSEPH. American jurist, died July 14, 1915. He was born in New York City in 1861, and was educated at the College of St. Francis Xavier in that city. In 1888 he graduated from the Columbia Law School. Appointed assistant corporation of council of New York City in the following year, in 1904 he became corporation counsel. He was elected to the Supreme Court of the State in 1910. Delany was prominent in important municipal litigation, including the fight for eighty-cent gas.

DELAWARE. POPULATION. The population of the State on July 1, 1915, was, according to

DAMS

ARROWROCK DAM
Boise, Idaho. Dedicated October 4, 1915

ELEPHANT BUTTE DAM
Rio Grande Project, New Mexico

TWO NOTABLE DAMS OF THE U. S. RECLAMATION SERVICE

an estimate of the United States Bureau of the Census, 211,698.

AGRICULTURE. The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1914-15, were as follows:

		Acreage	Prod. Bu.	Value
Corn	1915	210,000	6,615,000	\$4,101,000
	1914	197,000	7,092,000	4,397,000
Wheat	1915	125,000	1,875,000	2,044,000
	1914	114,000	2,387,000	2,547,000
Oats	1915	4,000	184,000	68,000
	1914	4,000	108,000	54,000
Rye	1915	1,000	16,000	16,000
	1914	1,000	18,000	17,000
Potatoes	1915	11,000	1,045,000	784,000
	1914	11,000	880,000	616,000
Hay	1915	70,000	84,000	1,428,000
	1914	72,000	79,000	1,343,000

a Tons.

TRANSPORTATION. The railway mileage of the State in 1914 was about 335. No construction has been undertaken in recent years.

EDUCATION. The total school population is about 50,000, with an enrollment of about 36,000, and an average daily attendance of 23,000. There are 1000 teachers employed, of whom about 860 are women.

FINANCE. According to the report of the State Treasurer for 1914, the total receipts for that year amounted to \$685,273, and the disbursements to \$716,653. There was a balance on hand at the beginning of the year of \$45,797, and at the end of the year of \$14,418.

CHARITIES AND CORRECTIONS. The State has no board of supervision over the charitable and correctional institutions. The Associated Charities of Wilmington has a director in direct supervision over many philanthropic institutions. These include the Home for Friendless Children, The Home for Aged Women, St. Joseph's School for Orphan Colored Boys, the Florence Crittenton Home, Delaware Industrial School for Girls, Home of Merciful Rest, and the Layton Home for Colored Persons—all at Wilmington. There are, in addition, several institutions at Dover and Marshalltown, the Delaware Hospital for the Insane at Farnhurst, and Newcastle County Hospital. The Delaware State Tuberculosis Commission has general charge of the work for the prevention and cure of this disease.

POLITICS AND GOVERNMENT. There was little of political interest in the State in 1914. The Legislature met, but the laws enacted were merely local in their significance. The most interesting feature of the State's economic history resulted from the operation of the munitions plants at Wilmington and other cities. Some of the largest powder and munition factories in the country are located in Delaware. The large number of war orders received resulted in the employment of large numbers of men, and the State received a large amount of money. For comments on explosions occurring in munition factories during the year 1915, see UNITED STATES AND THE WAR.

STATE OFFICERS. Governor, Charles R. Miller; Lieutenant-Governor, Colen Ferguson; Secretary of State, George H. Hall; Attorney-General, Josiah L. Wolcott; State Treasurer, William J. Swain; Auditor of Accounts, John W. Luff; Commissioner of Insurance and Banking, William M. McCabe.

SUPREME COURT. Chancellor, Charles M. Cur-

tis; Chief Justice, James Pennewill; Associate Judge-at-large, Thomas B. Heisel; Associate Judges, Herbert L. Rice, William H. Boyce, Henry C. Conrad.

STATE LEGISLATURE:

	Senate	House	Joint Ballot
Republicans	9	19	28
Democrats	8	16	24
Republican majority..	1	3	4

DELCASSE'S RESIGNATION. See FRANCE, *History*, section so entitled.

DENMARK. A constitutional European monarchy situated north of Germany, between the North and Baltic seas. Copenhagen is the capital.

AREA AND POPULATION. The area and population by insular and mainland divisions, according to the census taken Feb. 1, 1911, compared with the figures for population in 1906, are shown in the following table:

Islands:	Sq. m.	Pop. 1906	Pop. 1911
Seeland	2,895	1,026,119	1,096,897
Bornhohn	227	41,081	42,885
Lolland-Falster	692	108,029	115,658
Fyn	1,841	289,046	303,179
Jutland:			
Southeast Jutland	2,827	452,445	492,264
Southwest Jutland	4,144	338,224	364,620
North Jutland	2,920	334,005	351,573
Total Denmark proper..	15,046	2,588,919	2,757,076
Faroe Islands	540	16,848	18,000
Total	15,586	2,605,267	2,775,076

The population of Denmark proper increased from 929,001 in 1801, to 1,969,039 in 1886, and 2,449,540 in 1901. Males (1911), 1,337,900; females, 1,419,176 (1,257,765 and 1,331,154 in 1906). The rural population in 1911 numbered 1,647,350, as compared with 1,565,585, an increase of 81,765; the urban, 1,109,726, as compared with 1,023,334, a gain of 86,392. Copenhagen (Köbenhavn), covering 28 square miles, had (1911) 462,161 inhabitants; Frederiksborg, 97,237; Aarhus, 61,755; Odense, 42,237; Aalborg, 33,449; Horsens, 23,843; Randers, 22,970; Esbjerg, 18,208; Vejle, 17,261; Fredericia, 14,228; Kolding, 14,219; Helsingör, 13,783; Svendborg, 12,667; Nykøbing, 11,010; Viborg, 10,885; Slagelse, 10,463.

Marriages in 1913 numbered 20,460 (20,533 in 1912); living births were 72,465 (74,651); still births, 1734 (1754); and deaths 35,378 (36,481).

PRODUCTION. Agriculture and dairying are the principal industries. About 80 per cent of the total area is productive; less than one-half the productive area is under crop, the remainder being forest, pasture, and meadow. The tables below give area (in hectares) and production (in quintals) of main crops, with yield per hectare in 1913:

	1913	1913	1914
		Hectares	
Wheat	40,512	54,044	54,044
Rye	276,009	245,786	245,786
Barley	233,714	241,409	241,409
Oats	402,939	428,387	428,387
Beets *	80,800	82,370	80,900
Potatoes	61,141	61,141	61,141

	Quintals			Qs.
	1912	1913	1914	ha.
Wheat	1,018,777	1,822,073	1,279,178	33.7
Rye	4,670,173	4,319,513	4,788,294	17.6
Barley	5,676,095	5,956,184	4,974,452	24.7

Potatoes	8,265,000	10,697,378	9,456,627	175.0

* Sugar beets.

Creameries in operation in 1911, 681, with 104,557 work people; the milk employed was from 605,208 cows, with an average production of 2570 kilos of milk per cow. The live stock censuses of July 15, 1909, and July 15, 1914, returned 535,018 horses and 568,240, respectively; cattle, 2,253,982 and 2,462,862 (of which, cows 1,281,674 and 1,310,268); sheep, 726,879 and 514,918; swine, 1,467,822 and 2,496,661; goats, 40,257 and 40,670; fowls, 11,815,783 and 15,153,999.

Margarine factories (1912), 26, with total output of 39,620 metric tons; beet-sugar mills, 9, with total output of 134,670 metric tons. Fisheries products (1911) were valued at 15,230,200 kroner.

COMMERCE, ETC. The general and special trade is shown below in kroner:

	1910	1912	1913
Imports:			
General ..	634,407,000	817,512,000	855,351,000
Special ...	577,166,000	740,015,000	777,424,000
Exports:			
General ..	548,074,000	682,082,000	721,290,000
Special ...	485,374,000	596,723,000	637,360,000

Principal exports (1913, special trade), values in thousands of kroner: Provisions, eggs, etc., 459,418; animals, 68,726; beverages, 1819; cereals, etc., 13,370; metals and hardware, 8058; colonial goods, 9306; wood and wooden-ware, 1722; textile manufactures, 1074.

Principal countries of origin and destination, general trade, values in thousands of kroner:

	Imports		Exports	
	1912	1913	1912	1913
Germany	314,286	328,308	181,646	178,694
United Kingdom ..	135,887	134,562	373,104	410,418
Sweden	69,060	71,104	38,352	84,088
Norway	9,166	8,755	18,541	19,300
United States	69,354	86,979	9,489	7,853
Russia	56,179	59,411	16,347	19,275
France	19,406	20,935	3,302	3,342
Netherlands	20,863	21,208	5,270	4,123
Belgium	9,902	10,275	1,726	8,052

Vessels entered in the 1913 trade, 41,071, of 4,615,800 tons; cleared, 42,042, of 1,637,067. Merchant marine (Jan. 1, 1914), 4386 vessels, of 566,727 tons.

Railways in operation at end of 1913, 2390 miles (1243 State owned); State telegraph service (1914), 8373 miles; telephone wires, 342,522 miles; post offices, 1171.

NAVY. The fleet, maintained for purposes of coast defense, is composed of 3 monitors carrying, each, two 9.4-inch and four 6-inch guns, and 1 carrying one 9.4 and three 4.7; 3 torpedo gunboats; 14 first-class torpedo boats; 6 submarines; besides an old battleship, a cruiser, and some small craft. Building: a coast-defense vessel and several submarines.

FINANCE. The budget for the financial year 1914-15 estimated the revenue at 132,525,240 kroner (taxes and duties, 83,586,400), and the

expenditure at 129,696,705 (war, 17,359,516; worship and instruction, 16,383,889; interior, 19,057,212; marine, 10,001,636; debt, 12,370,401; justice, 10,276,167; finance, 10,075,547). The debt stood (March 31, 1914) at 358,962,084 kroner.

GOVERNMENT. The King is the executive, assisted by a ministry of eight members, appointed by him and responsible to the Parliament, or Rigsdag. This body consists of an upper house of 66 and a lower of 114 members. Justice is administered by judges of the Hundreds and by city magistrates, from whose courts appeals are taken to the superior courts at Viborg and Copenhagen. There is also a supreme court of last recourse of 24 judges at Copenhagen. In case of impeachment of ministers the Upper House appoints 4 judges to sit with the Supreme Court as a joint tribunal. Reigning sovereign, Christian Charles Frederick Albert Alexander William, born Sept. 26, 1870; married April 26, 1898, to Alexandrine, Duchess of Mecklenburg (born Dec. 24, 1879); proclaimed king (Christian X) May 15, 1912, upon the death (May 14) of his father, King Frederick VIII. Heir-apparent, Prince Christian Frederick Francis Michael (born March 11, 1899).

HISTORY

CONSTITUTIONAL REFORMS. The democratic constitutional amendments which had been defeated by the Landsting in 1914 (consult YEAR BOOK, 1914, DENMARK) were again proposed by the Folkething in the spring of 1915, and since changes in the membership of the Landsting had in the interim created a favorable majority, the amendments were now finally passed and received the King's assent, June 5, 1915. Under the amended constitution, the property qualification which had previously excluded the poorer classes from voting for the members of the Landsting was abolished; the twelve members hitherto appointed by the Crown were henceforth to be elected; and full political status, implying both the right to vote in parliamentary elections and the privilege of eligibility to sit in the Folkething, were conferred upon the women of Denmark. A fortnight later another important constitutional amendment, enfranchising the women of Iceland, received the royal signature. Shortly after the passing of these constitutional reforms, particularly violent attacks upon the Radical government began to appear in the Conservative press of Denmark, coupled with insistent demands for the creation of a coalition cabinet. In reply to its critics, the government called a conference of all parties, and invited the Opposition to state its grievances. As the criticism of the government's interpretation of the duties of neutrality in the war had been especially keen, it was expected and freely predicted that the neutrality issue would cause the overthrow of M. Zahle's Radical cabinet. By meeting frankly his antagonists in conference, however, M. Zahle was able to disarm his critics, and maintained himself in office. Consequently the Conservatives were unable to erase the constitutional amendments from the statute book, and Premier Zahle could confidently announce, October 26th, that the forthcoming elections in the summer of 1916 would be conducted under the new electoral laws.

EFFECT OF THE WAR UPON DENMARK. Rumors that foodstuffs and contraband commodities

were being imported into Germany by way of Denmark received wide credence and evoked caustic criticism of Danish neutrality in the British press. Trade statistics, showing that Denmark's imports from the United States had suddenly increased from \$600,000 in 1913, to \$7,000,000 in 1914, were adduced as evidence that Denmark was serving simply as a channel for German imports. In answer to this insinuation, the Danish foreign minister, M. Scavenius, on January 11th explained that before the war a large part of Denmark's imports had come through Germany, whereas now they were being obtained direct. Owing to the delays and uncertainties of commerce during war-time, moreover, prudent traders naturally desired to maintain a surplus store of imported merchandise, and ordered larger quantities than were actually required for current consumption. In March, Denmark, in concert with the other Scandinavian States, made representations to Great Britain, protesting against the latter's policy of interfering with neutral shipping, as enunciated by the British Order in Council of March 15th. On May 26th the Danish steamer *Betty* was sunk by a German submarine. In response to Danish remonstrances, Germany agreed, August 23rd, to pay damages for the loss of the steamer. Denmark was also forced to lodge a protest with the German government with regard to the destruction of the British submarine *E-13*, which had run aground on the Danish island of Salt-holm. (For further information concerning naval events and commercial warfare in Scandinavian waters, consult the article, WAR OF THE NATIONS.)

THE SCANDINAVIAN INTERPARLIAMENTARY UNION. In September, representatives from the three Scandinavian countries, Denmark, Norway, and Sweden, met in the Northern Interparliamentary Union Congress at Copenhagen. Especially interesting was the speech of former Finance Minister Neergard, chairman of the Danish War Insurance Institute, reviewing the effect of the war upon Denmark's economic life. "There is no more vital issue during the war," said M. Neergard, "than the security of neutral shipping." Especially for the Scandinavian peoples he held this to be true. The planting of mines in the path of neutral commerce had been one of the most injurious practices of the belligerents. "At the start [of the war] the North Sea became a hotbed for mines, and it was only after repeated protests that such routes were established as brought comparative safety to traffic. In most instances the Danish War Insurance Company has been compelled to make these routes obligatory, no matter what has been the inconvenience to ship-owners. Likewise, in the Baltic many mines have been planted, and the losses on this score to date amount to 10 ships, valued at 3,700,000 crowns." The fact that the mines usually defied identification, and that damages consequently were impossible to obtain, was particularly irritating. Since May 27th, however, no losses had been occasioned by mines. A new question had since arisen, the question of contraband. England, M. Neergard admitted, observed the Declaration of London in regard to contraband more strictly than Germany, for Germany considered the Declaration void, whereas "Great Britain is strong enough to secure its prizes in a more conventional manner." In the question of neutral prizes, "Germany has pro-

ceeded in the most unconcerned manner as regards formerly established regulations. It is certainly contrary to the rights of nations that Germany should destroy neutral ships." M. Mo-vinckel, a Norwegian delegate at the congress, gave out the interesting information that although at first Norway's shipping interests had suffered enormously—100,000 crowns a day—and although during the first year of the war Norway had lost 61 ships, valued at 18,000,000 crowns, either by mine or by submarine, nevertheless, under the protection of a government insurance organization, Norway's merchant marine had increased in value within the past year from 400,000,000 crowns to 500,000,000 crowns. A delegate from Sweden made a similar statement for his country: that Swedish shipping had been paralyzed at the beginning of the war, but that since the policy of State insurance had been adopted, the prosperity of Swedish shipping had in large measure returned. Before disbanding, the Congress of the Interparliamentary Union passed a resolution in favor of maintaining the policy of neutrality and of close co-operation among the three Scandinavian States.

THE SCANDINAVIAN PEACE CONGRESS AT COPENHAGEN. In September, a Peace Congress representing Denmark, Sweden, and Norway, was held in Copenhagen. Many helpful suggestions were made for methods of promoting the cause of peace. Historians should treat of peaceful progress rather than of battles and treaties. A universal language would be a great step forward in the direction of international solidarity. "Children should not be allowed to play with tin soldiers." "In the universities the seed of peace should be firmly implanted in the mind of youth," said another delegate. The resolutions finally adopted by the Congress were chiefly directed against compulsory military service, on the ground that it was not only likely to lead to war, but also infringed the rights of individuals. See INTERNATIONAL PEACE AND ARBITRATION.

DESCLAUX GRAFT CASE. See FRANCE, *History*, section so entitled.

DIABETES. Fasting and a low diet have long been known to benefit sufferers from diabetes mellitus, but a new method advocated by Allen, of the Rockefeller Institute, puts the treatment on a more scientific basis than it has hitherto possessed and makes the method almost specific in uncomplicated cases. The object of treatment is to produce a sugar-free and acid-free urine. Experiments show that this object may be attained by an initial fast of from 8 to 10 days. Hitherto a rapid loss of body weight has been considered a dangerous risk in the fasting treatment, but this fear is shown to have

little basis. After the excretion of sugar has been stopped and the acidosis controlled, a suitable diet is advised; but instead of attempting to increase the weight, the aim is now to keep the weight low in the belief that the reduction is beneficial. Any gain in weight which results in a return of glycosuria is harmful. During the fasting period alcohol may be given until the ketonuria disappears. Even weak and emaciated patients are said to bear the fasting without untoward results. Their behavior indicates that they are suffering from a kind of intoxication, rather than from a lack of nutrition.

As an article of diet for diabetics, the soy bean has been urged as a nourishing food. It is almost free from starch, and at the same time rich in protein and fat. The soy bean (*Glycine hispida*) is an annual leguminous plant, grown extensively in Japan and China, and used for food from time immemorial. Over 200 varieties of the plant are known. It was introduced into the United States on the return of the Perry expedition from Japan, in 1853, but it was known, both in Europe and this country, before this time, as a botanic curiosity. Street and Baily, of the analytical laboratory of the Connecticut Experiment Station, have analyzed several varieties of soy bean grown on the station farm, giving the following average percentages: water, 10; ash, 5.54; protein, 38.29; fibre, 4.64; nitrogen-free extract, representing the total carbohydrates, 26.64; and fat, 14.89. The average percentages of commercial soy bean flours are: water, 5.1; ash, 4.5; protein, 42.5; fibre, 3.7; nitrogen-free extract, 24.3; and fat, 19.9. The carbohydrates consist of forms not considered dangerous to diabetics. The bean is just beginning to take a place as a farm crop. It is a palatable vegetable, but is not in general use as human food, being employed chiefly as a forage plant, for ensilage and fertilizer. See C. V. Piper, and T. H. Nuelsen, "Soy Bean" (*Farmers' Bulletin*, 372, U. S. Dept. Agriculture, 1909); and Carleton R. Ball, "Soy Bean Varieties" (*Bureau of Plant Industry*, 98, U. S. Dept. Agriculture, 1907).

DIAMONDS. See MINERALOGY, section so entitled.

DIAZ, PORFIRIO. President of the Republic of Mexico from 1876 to 1880 and from 1884 to 1911, died at Paris, France, July 2, 1915. When he first assumed the reins of government, revolutions and brigandage were rampant, ignorance, poverty, and corruption everywhere prevailed.

Diaz first of all was a fighter. The revolutions he crushed with an iron hand; and was successful in suppressing brigandage and corruption. Turning his attention to the development of the vast resources of his country, he invited the investment of foreign capital, at the same time seeing to it that no internal disorder and lawlessness should exist to frighten away the desired investors.

Industrial establishments of every type sprang into being, giving employment to thousands. The banking business of the country was put on a firm basis for the first time. Vast engineering works, including the draining of the valley of Mexico, the construction of 15,000 miles of railroad, and the building of many reservoirs, were undertaken. While all these plans for the betterment of his country were being carried out Diaz also found time to swing his energies into still another channel of perhaps

greater importance, that of education. He established a public school system and founded normal schools, manual training schools, colleges, and professional schools. Nor were women overlooked in Diaz's educational schemes, and the first of his girls' institutions of learning was opened at his native town of Oaxaca.

In carrying out his programme of reforms, he was frequently accused of arbitrary conduct. He was, in fact, an absolute dictator, and the history of Mexico prior and subsequent to his régime would seem to indicate that only a man of this strong type could hope to attain similar success. He knew his people, or rather mixture of peoples, and appreciated that a firm hand was needed if order and progress were to be obtained.

Diaz was born in Oaxaca on Sept. 15, 1830. His father was a Spaniard, and his mother the daughter of a Spaniard and an Indian woman. The death of the father, when Porfirio was only three years old, left the family in the throes of poverty. Friends, however, came to the rescue and young Diaz was enabled to study for the priesthood. As he grew older, the idea of a church career lost its appeal and he decided to devote himself to the law. In taking this step he followed the advice of Juarez, who was later to become president of Mexico.

When war broke out between Mexico and the United States, Diaz declared himself against the rule of Santa Anna and an order was issued for his arrest. He took refuge in the mountains and later joined a band of Indian revolutionists, of which he became commander. At first he met with success in combat with the government troops, but his band was finally dispersed, and he remained in hiding until 1855, when General Alvarez overthrew Santa Anna.

Diaz was made sub-prefect of Ixtlan by Alvarez and immediately began to organize the Indians in his territory into an army. A revolution was started in November, 1855, which forced Alvarez to resign. Gen. José Maria Garcia raised an army which he led against Diaz, who with his Indian forces won a signal victory and induced Garcia to abandon his plans. An uprising in Tehuantepec next demanded the attention of Diaz, who emerged a victor but only after being severely wounded.

The revolution was eventually quelled and Juarez succeeded to the presidency. Diaz was appointed a lieutenant-colonel, although but 28 years old, and also was chosen deputy to the national Congress. When Napoleon III made his attempt to found an empire in Mexico, Diaz was put in military command of Jalapa, which was occupied by a French army. He won much praise for his skillful conduct of the campaign in that section and came to be looked upon as one of the ablest and most patriotic of the Mexican generals.

After the battle of Santa Ines he was captured by the French, but escaped and joined President Juarez and his army in Northern Mexico, being placed in command of the native troops, whom he reorganized effectively. In 1863 Diaz was made a general of division, the highest rank in the Mexican army. The following year he met with reverses in battle and was obliged to surrender to the French General Bazaine. Once more he escaped and started his third campaign against the invaders. The interference of the United States at this juncture

restored peace to the country, Diaz capturing the Emperor Maximilian and marching into the capital in 1867.

After being an unsuccessful candidate for the presidency against his friend Juarez, Diaz retired for the time from public life. In 1871 he organized a rebellion against the government. During the fighting his brother, Felix, was killed, and Diaz was forced to flee. At the death of Juarez he pledged his support to Lerdo de Tejada, but in 1874 he started an insurrection, was defeated and took refuge in the United States. Two years later he returned to Mexico and, raising an army, triumphed over Lerdo at Tocoac. In 1877 he became president. As the constitution provided that no man should hold the office of chief executive for two consecutive terms, Diaz was succeeded in 1880 by his close personal friend, General Gonzalez, while he became governor of Oaxaca. Diaz was unanimously elected president in 1884 and, changing the constitution, continued in office term after term until his resignation in May, 1911.

The fall of Diaz was brought about by the rebellion launched by Francisco I. Madero, one of the leading capitalists of the country, and representing the large and constantly growing number of Mexicans who felt Diaz was flagrantly abusing his power. Diaz left Mexico soon afterward and passed his remaining days in various European capitals, death coming to him in Paris. See MEXICO.

DIGESTION. See FOOD AND NUTRITION.

DIPHTHERIA. The control of this disease has been advanced by the use of the Schick test, which has been extensively used during the past year. This test consists in injecting, beneath the superficial layers of the skin, a diluted standardized diphtheria toxin of such strength that 0.1 c.c. contains $\frac{1}{60}$ of the minimum lethal dose for a guinea pig weighing 250 grams. A positive reaction is characterized by a steadily increasing area of reddening and induration about the site of the puncture, reaching its maximum in 48 hours and lasting for about a week. Such a reaction indicates that the subject is susceptible to diphtheria, i.e. he has not sufficient antitoxin in his blood to resist an invasion of diphtheria bacilli. When there is no reaction, the subject is immune and possesses sufficient antitoxin in his blood to resist contagion. The value of the Schick test lies in the fact that it is now possible to discriminate between immune and non-immune persons, especially nurses, children, and others who may be exposed to diphtheria, thus rendering unnecessary the administration of prophylactic doses of antitoxin in those found by the test to be immune. It is also of value in detecting "carriers" who are always non-susceptible and give a negative reaction; yet a culture taken from them will usually show a growth of diphtheria germs. It has been found by Kolmer and Moshage that 40 to 50 per cent of children under 15 years of age react positively; also that immunity conferred by an injection of antitoxin begins to disappear in 10 days and is lost entirely in about four weeks; also that scarlet fever patients are especially susceptible to diphtheria. The immunity conferred by an attack of diphtheria is of short duration or it may be entirely absent. The New York Health Department encourages the general use of the Schick

test and supplies an outfit to physicians for its application.

DISASTER AT SEA. See SAFETY AT SEA.

DISCIPLES OF CHRIST. The total membership in this religious body in 1914 was 2,283,003. There were 17,236 churches, and 14,184 ministers. The sect has two bodies: The Disciples of Christ proper, with 1,363,163 communicants, 8494 churches, 6161 ministers; and the Church of Christ, with about 157,000 communicants, 2700 churches, and 2100 ministers. The churches lie chiefly in the Middle West and in the South, though the denomination is represented in nearly every State in the Union. Churches are also found in Australia, and other provinces of Great Britain, in Cuba, Scandinavia, and the Philippines. The denomination controls 26 institutes of learning. Missionary work is carried on in several countries. The income of the missionary societies in 1914 was \$1,506,716. Of the general convention, which met in October, 1915, Dr. F. W. Richardson, Kansas City, Mo., is president, and Rev. Robert G. Frank, Liberty, Mo., is secretary.

DIVING. In the raising of the United States submarine *F-4*, which sank in the harbor of Honolulu, Hawaii, March 29, 1915, the United States made use of experiment and training in deep water diving which had been carried on for two years previously. These experiments carried much further some that were undertaken by the British government in 1906 and 1907, where divers had been able to go down to a depth of 200 feet in safety, the best results being secured by bringing the diver up by stages, allowing a period of from 15 to 30 minutes at each stop for him to become used to the altered pressure. In other words, the trouble was due to the improper decompression, and the blood which had taken up nitrogen from the air did not have opportunity to eliminate it. In the American navy the greatest depth previously attained was 100 feet, and accordingly it was decided to undertake a series of tests in a tank where conditions equivalent to a depth up to 215 feet could be reproduced. These experiments were begun in February, 1914, and continued for a number of months, checking the English decompression table and accustoming the divers under training to deep water work, and also testing the various features of the equipment, such as suits, helmets, and other gear, as well as modern self-contained diving apparatus equipped with chemical and oxygen cylinders. As a result of this work an improved method of feeding air to the divers from compressed-air cylinders instead of by hand pumps was adopted, properly devised valves, air washers, and other devices regulating the supply of air. A diver's telephone was also devised so that conversation was possible at any time, where formerly the diver depended on signals by line. This work, which was mainly under the charge of Chief Gunner George D. Stillson, United States navy, was supplemented by actual tests in deep water, the torpedo boat destroyer *Walke* being equipped

with diving apparatus, including a recompression tank for the treatment of divers affected by the bends. During these practical tests, Chief Gunner's Mate Drelishak made a world's record at 274 feet, remaining under water long enough to work. Immediately upon receipt of the news of the disaster to the submarine *F-4*, Chief Gunner Stillson and five assistants, accompanied by a naval surgeon, were hurried to Honolulu, and the submarine was found covered by about 275 feet of water. The divers were able to attach lines to the vessel, and the greatest depth attained by any diver, 288 feet, a world's record, was made.

DOCKS AND HARBORS. UNITED STATES.
New London. The State of Connecticut during the year 1915 was engaged in the construction of a 1000-foot pier, 200 feet wide, at New London, at a cost of \$1,000,000. The design adopted under the appropriation made by the State Legislature in 1911 called for a fill inside of masonry bulkheads, with outside deck made up of pre-cast concrete slabs resting on creosoted timber piles. This new pier, made for a steamship terminal, was designed for a commercial life of 25 years, this time being selected, as it was thought that in the interval changes in transportation would render of doubtful utility any more permanent construction.

New Orleans Improvement. During the year work was begun on an important port improvement in New Orleans, whereby a large wharf, six large reinforced concrete cotton warehouses, and a railway terminal covering approximately 100 acres of ground, and costing \$3,500,000, were put under way. The terminal wharves, located on the Mississippi River, were to be two-story structures of reinforced concrete, 2000 feet in length, and 180 feet wide, built on pine piles placed 20 feet on centres each way. On these piles reinforced concrete columns were to be carried up to the first floor of the wharf, the two stories of the superstructure being 16 feet 8 inches, and 15 feet 8 inches, respectively. The wharf and general terminal were to be provided with conveyor apparatus for handling cargoes and a complete system of railway tracks.

New York Docks and Piers. The construction of the water terminal to be connected with the New Haven, Pennsylvania, and New York Central railroads at Hunt's Point, in the Borough of the Bronx, was in active progress during the year. This project involved the construction and filling in behind a 3600-foot bulkhead to reclaim 200 acres of ground, and required heavy pile driving, dredging, the placing of 400,000 tons of riprap, and extensive filling with other materials, not to mention suction dredge working. As much of the work had to be done in originally soft mud and varying types of bottom, practically every form of construction was involved, and a large amount of stone from Bronx subway cuts was employed in the filling. Work was in progress during the year on a new South Brooklyn pier at 35th Street, 1740 feet in length, 175 feet wide, this being the longest pier yet built in New York Harbor. This pier has a railway track on either side so that there can be direct transfer from ship to cars, which the steamship company owning the pier claims is both possible and essential. The shed of the pier is nearly 140 feet wide, and the tracks are placed outside the shed. The floor slabs are of reinforced concrete. The pier will be connected

eventually with the Brooklyn marginal railway. Two other piers, at 29th and 30th Streets, South Brooklyn, were also under construction. The pier construction was typical of other New York City piers, in that pile bents spaced 10 feet apart and trussed were employed, on which were laid reinforced concrete slabs. Work continued actively during the year on the new ocean steamship piers in the Hudson River at 46th Street.

Boston. During 1915 much excavation had been done for the new South Boston dry dock, which was to be the largest in the United States, being 1200 x 140 feet in over all dimensions.

Philadelphia. Two piers, known as the Southwark piers, were completed during the year at Philadelphia. It was part of a scheme ultimately to give the city a municipally owned waterfront of more than a mile. These two piers were the first of such a group, and represented the best construction yet undertaken by the city, being designed along the lines of the general Philadelphia type of construction with reinforced concrete substructures extending down to low water and carried on wooden piles. The superstructure was of structural steel with reinforced concrete facings. The two new piers, known as Nos. 38 and 40, are along the Delaware River at the foot of Queen and Christian Streets, 550 feet in length, 180 feet wide, and 200 feet apart. These piers are two-story structures with numerous elevators and sheds of various kinds, while the railroad tracks down the middle of each pier connect with the belt line on Delaware Avenue. The actual construction of this work, which will involve eventually the expenditure of \$24,000,000 for the South Philadelphia Railway improvement, began in April, and involved not only an extensive railway system to give access to the piers and to the various industries along the river, but also a systematic improvement of the water front.

Los Angeles. The city of Los Angeles had under construction a large timber wharf and shed on Mormon Island channel in the inner harbor and a concrete wharf and steel shed on the east side of the east channel in the outer harbor. The latter was one of the first sections of the outer harbor improvement, and is a dock 650 feet wide and 4000 feet long, with the main ship channel on one side and the east channel on the other.

Chicago. In Chicago a municipal pier was under construction for freight and passenger steamship service, with a recreation space and public hall in addition located north of the mouth of the Chicago River in line with Grand Avenue and Illinois Street. It was 3000 feet long and 292 feet in width. At the shore end was a head house forming an ornamental entrance and carrying offices on its upper floors. Two parallel double deck buildings, 2335 feet in length, are used for freight and passenger service, and are supported on a central 80-foot driveway. The remaining 665 feet of the pier length are devoted to recreation purposes, with an open upper deck which forms a shelter for the space below. Near the end of the pier is a municipal hall for public meetings, concerts, etc. Two double track railways extend along the sides of the driveway adjacent to the sheds, and a double track incline will connect the street railways with tracks on the upper deck of the pier. The pier is an elaborate structure and the total cost was estimated at about \$4,000,000.

Cleveland. At Cleveland, Ohio, the new Ninth Street pier in Lake Erie was opened for service late in June, so that the steamship companies could use the lake proper for docking instead of the channel of the Cuyahoga River, the lake front being protected by an extended breakwater. This new pier was built by the steamship companies and is connected to the trunk line railways. It is 720 feet in length and 300 feet wide, being made of a continuous line of concrete wall, part of which is founded on the remains of an old bulkhead and the rest on new pile construction.

St. Louis. Plans for the first section of the municipal dock system at St. Louis, Mo., were approved, during 1915, by the Board of Public Service, and an ordinance authorizing the construction was introduced in the Board of Aldermen. The estimated cost of the dock alone is \$255,000, and of equipment \$30,000. The first unit of the dock was to be 300 feet long out of a total length of 1200 feet, and was to be a reinforced-concrete structure, including both piling and decks. The dock will be open underneath and ripped. A railroad track was to extend down the centre of the dock, back of which a steel frame warehouse was to be built. The dock was to be equipped with two traveling cranes for transferring material between either boats and cars, or between boats and the warehouse, and the warehouse and platforms were to be equipped with electric trucks. The estimated cost of the other three sections of the dock, subsequently to be put under construction, was \$155,000.

Coal Dock at Toledo. At the opening of navigation on the Great Lakes a new coal handling plant, dock, and yard, containing one of the three largest car dumpers in the country, was put into use at Toledo, Ohio, by the Cincinnati, Hamilton, and Dayton Railway. This new terminal, which was constructed during the winter, involved 802 feet of concrete dock, concrete foundations for the unloader, approach, and run-off trestles, the relaying of the load and empty yards, and the erection of the unloader frame and machinery. The load yard has a capacity for 140 cars, and the empty yard for 96 cars. The new dock, except at the unloaders, is of reinforced concrete on piles cut off 18 inches below the water line.

BALBOA DRY DOCK. The important dry dock at Balboa for the Panama Canal, described in the YEAR BOOK for 1914, was practically completed at the end of 1915. A second dry dock had been planned, but its erection was not contemplated for some years.

CANADA. Halifax. The largest harbor work in progress during the year in North America was at Halifax, N. S., where the Dominion Department of Railways and Canals was developing the port as a part of a project to cost \$30,000,000. Contracts in force during the year totaled over \$7,000,000, and the new work involved the building of a large reinforced concrete pier, as one of six for deep water vessels, as well as a 2000-foot landing quay, and some 6 miles of railways, so as to insure communication throughout the terminal and with the railways. Halifax is a deep water, all the year, port, and the work is being prosecuted with the idea of making it an important landing place for the commerce of Canada. The construction work for the quay wall involved the use of 60-

ton concrete blocks stacked up to the required height and joined together laterally to form a continuous wall. Above low water granite facing is employed as a protection against frost and sea water. An elaborate system of shed and warehouse structures has been planned, and the construction was actively in progress during the year. The plan for the Halifax port development was so well worked out that it was believed that when completed the terminal costs at this port could be brought in proper relation to its operation costs, but it was a problem whether, with all its facilities and low terminal charges, sufficient commerce would be directed to Halifax in preference to Montreal and Quebec, to warrant the long railway hauls from the interior to the coast.

Prince Rupert. The official test of the 20,000-ton floating dry-dock at the ship-repair plant of the Grand Trunk Pacific Railway at Prince Rupert, Canada, was made successfully during the year, and the plant was ready for work. It includes a carpenter shop, shipbuilding shed, launching platform, machine shop, boiler and blacksmith shops, foundry, and a power plant.

Victoria. Progress was continued during the year at Victoria, B. C., in harbor development under the supervision of the Department of Public Works of Canada. The project involved the construction of 2500 feet of breakwater and two large docks in the outer harbor, all with rubber-mound foundations and reinforced concrete superstructure. The breakwater affords a 90-acre area of shelter, within which are the two docks, which have berthing space from 800 to 1000 feet in length. The improvement of the channel was also under way, and it was intended that the inner harbor should be used by smaller craft.

Toronto. During 1915, \$2,000,000 was being spent on the Toronto harbor improvement, being devoted to the water front between the Don and the Humber rivers, and supplementing the \$1,400,000 spent in 1914 in piles, cribs, dredging, and filling. The total estimated cost of the entire improvement, which is about equally divided between the Harbor Commission and the Dominion government, is \$24,000,000, and contracts for nearly \$11,000,000 have been let.

ZUYDER ZEE. One effect of the war was the postponement of the vast project for the reclamation of the Zuyder Zee, which had been discussed for a quarter of a century previously, and which latterly had been developed in distinct plans whose consideration by the Dutch Parliament was desired. It was necessary first to have the various departments of the government approve the plans, and this approval had been forthcoming for all the civil departments, but the War Department had been unable up to 1915 to pass on the military features of the reclamation project, as naturally this affected the schemes of national defense, and was one reason for the delay, although financial considerations also applied. The proposed scheme was to cost 300,000,000 guilders (a guilder equaling forty United States cents), and would reclaim at the same time an area of about 47,000,000 acres. The cost of the project would be spread over a number of years, but with the expense for mobilization, which up to September had amounted to 275,000,000 guilders within its European limits, and 65,000,000 in the colonies, with a flotation of a 200,000,000 guilder war

loan, there was little chance for expenditure on civic works. The project was of interest, as it involved a vast mileage of dykes, canals, with locks connecting the canals with the sea, large pumping stations, and various economic problems, such as the destruction of the salt water fishing industry and its possible replacement by a fresh water fishing industry of large proportions. Further, there would be involved the construction of an auxiliary system of canals to preserve water communication facilities for the towns on the Zuyder Zee, and a provision for suitable materials for the levees and other works, many of these not being native to Dutch soil. On the engineering side the project was so complete and interesting that its abandonment even temporarily was a source of regret. See CANALS.

DODGE, ARTHUR PILLSBURY. American lawyer, inventor, and publisher, died Oct. 12, 1915. He was born in Enfield, Mass., in 1849; studied law; and in 1879 was admitted to the bar. In 1886 he founded the *New England Magazine*, and later the *Bay State Monthly*, and the *Granite State Monthly*. For a time engaged in the publishing business, he later became interested, through his association with George M. Pullman, in motor power for railways.

DOLOMITE. See GEOLOGY.

DOMINICA. A presidency of the Leeward Islands colony. Most of the inhabitants are descendants of the original French settlers and speak a patois. Roseau, the capital, had, at the 1911 census, 6577 inhabitants. The island is fertile; coffee, sugar, spices, oils, timber, fruits, etc., are exported. Trade and finance statistics for the years 1907-14 are given in the following table:

	1907-8	1909-10	1910-11	1913-14
Imports	£121,650	£128,779	£147,332	£175,590
Exports	124,294	102,339	112,111	190,701
Revenue	39,865	39,521	42,133	48,143
Expenditure ...	31,486	41,860	39,603	47,572
Shipping *	508,631	713,227	694,985	572,222

* Tonnage entered and cleared.

See LEEWARD ISLANDS.

DOMINICAN REPUBLIC, THE. An independent state occupying the larger and eastern part of the Island of Haiti. The capital is Santo Domingo.

AREA, POPULATION, ETC. The republic consists of 12 provinces, with an estimated area of 48,577 square kilometers (18,756 square miles). Estimates of population vary. A 1913 estimate was 724,500. In October, 1915, the *Gaceta Oficial* stated the population (as for Dec. 31, 1914) at 657,270. The population of Santo Domingo was given as 26,486; according to an unofficial census, reported earlier in 1915, the population was 23,624. Estimated population of other towns: Santiago, 20,000; Puerto Plata (the chief port) and San Pedro de Macoris, 15,000 to 16,000 each; Samaná, La Vega, Sánchez, Monte Cristi, and Azua, 4000 to 5000 each.

Reported births in 1913, 27,332, and in 1914, 24,319; marriages, 2557 and 2022; deaths in 1914, 6393; immigration in 1914, 3930, and emigration, 1587. Primary instruction is free and nominally compulsory. In 1911 there were 590 schools, with 20,453 pupils. The state religion is Roman Catholicism.

PRODUCTION, COMMERCE, ETC. Agriculture and cattle raising are virtually the only source of national wealth, as mining and manufacturing are little developed. Sugar and cacao are commercially the leading crops. Others of importance are tobacco, coffee, cotton, and bananas and other fruits.

Several different sets of figures were published in 1915 purporting to state the commerce of 1914. The following are taken from the *Gaceta Oficial* mentioned above. Imports and exports in 1913, \$9,348,839 and \$10,047,297; in 1914, \$6,608,112 and \$10,611,228. Sugar export in 1914, 103,331 metric tons, valued at \$4,973,272; cacao, 20,825 metric tons, \$3,899,102. Considerably more than half the trade, both importation and exportation, is with the United States.

The length of railway in operation is reported at 282 kilometers (175 miles); in addition there are private lines for sugar plantations reported at 362 kilometers (225 miles). Telegraph offices, 16, with 352 miles of line. Post offices, 105.

FINANCE. The unit of value is the American dollar. For 1915, estimated revenue and expenditure, \$4,485,350 and \$4,490,821, respectively. Nearly four-fifths of the revenue is derived from customs. A treaty between the Dominican Republic and the United States authorized a loan of \$20,000,000 for the conversion of the debt, and established an American receivership of customs from April 1, 1905. The sum of only about \$14,000,000 was issued, the balance being kept against certain disputed liabilities and the provision of a fund for public works. Total outstanding, Dec. 31, 1914, \$13,042,850. A further loan of \$1,500,000, having no connection with the original loan, was issued in March, 1913. Both loans are guaranteed by the customs. By agreement between the Dominican and American governments in 1914, an American financial expert was appointed to control the national expenditure and the revenues other than those derived from customs.

GOVERNMENT. The executive authority is vested in a President, who, constitutionally, is elected by indirect vote for six years. The legislative power rests with a Congress of two houses, the Senate (12 members, elected for six years) and the Chamber of Deputies (24 members, elected for four years). In 1913 José Bordas Valdés became provisional President, assuming office April 14th. After the insurrection of 1914, Bordas Valdés resigned (August 27th), and the Congress elected Ramón Báez as provisional President. At elections held later in 1914, Juan Isidro Jiménez was chosen President, and on December 5th he was inaugurated for the six-year term.

HISTORY. Confusion in Financial Affairs. Late in January it became known that a shortage existed in the San Domingo Department of Public Works. Under the right which was given to the United States by the convention between the two countries, Secretary of State Bryan, on January 22nd, ordered an investigation of the situation. Three days later the State Department at Washington issued the statement: "When Nolasca, the auditor in charge of the Public Works Fund, was removed recently, a defalcation of some \$8000 was discovered. The irregularities date back at least two years. A further defalcation of \$1000 is reported under the Mann administration. Nolasca is a citizen

of Santo Domingo and his appointment was made by the Santo Domingo government. Full information has been asked for, and, in so far as the prosecution depends upon the actions of this government, instructions will be given when the facts are fully known." By the terms of the convention American officials were in charge of the customs houses of the republic as well as several other financial posts. It is the duty of these officials to see that the interest on the American-owned debt is paid monthly, that the sinking fund is enlarged, and that the residue of the customs, after 5 per cent is taken out for expenses, is turned over to the government. The defalcation of the two sums of \$8000 and \$1000 occurred entirely in the native administration of affairs, not in any department with which Americans were connected.

Sullivan Inquiry. On January 13th, President Wilson ordered an investigation as to the fitness of James M. Sullivan, minister to Santo Domingo. This investigation was in answer to a letter sent to the President by W. W. Vick, formerly connected with the American administration of Dominican customs. Mr. Vick charged that Sullivan owed his appointment to a political group representing the interests of the *Banco Nacional* of San Domingo, who had in view the control of concessions, government contracts, or deposits of government funds. The names of Secretary of State Bryan, ex-Governor Martin H. Glynn of New York, and Representative James H. Hamill were mentioned among those alleged to share in profits from the prospective contracts. Witnesses testified in New York, Washington, and Philadelphia, while officials likewise came from the *Banco Nacional* to offer their evidence. It became known in June that Senator Phelan, in charge of the investigation, reported to the President that Minister Sullivan had done nothing which involved moral turpitude, but was temperamentally unfitted for a diplomatic post. Consequently, Minister Sullivan's resignation was announced in July.

Internal Affairs. In March, Governor Zayas of Santo Domingo and two of his children were murdered at Azua, a small town 55 miles southwest of Santo Domingo. Zayas had gone to Azua to assume the duties of governor, and had been in office only two days. His assassination was brought about by political enemies. In April, Minister Sullivan reported a new revolution in the island. The cruiser *Des Moines* was ordered from Progreso, Mexico, to assist the gunboat *Nashville* in maintaining order. Three commissioners, Jacinto Peynarado, minister of justice, Frederico Velasquez, minister of public works, and Dr. Henriquez, were appointed in May to discuss financial matters with American financiers. In September, two new appointments were made in President Jiménez's cabinet. They were José Manuel Francisco Jiménez, minister of interior, and Francisco Herrera, minister of finance. Jiménez had held the portfolios of interior and public works in previous administrations.

DONALDSON, SIR JAMES. English scholar and educator, died March 10, 1915. He was born in 1831, and was educated in the Aberdeen grammar school, in the University of Aberdeen, at New College, London, and at Berlin University. In 1854, appointed director of the high school in Stirling, he became, in 1856, classical

master of the high school of Edinburgh, and in 1881 professor at Aberdeen University. He held this position until 1886, when he was appointed vice-chancellor and principal of the University of St. Andrews. He was one of the first to endorse simplified spelling. He wrote widely and authoritatively on a number of educational subjects. In 1907 he was knighted. His published writings include: *A Greek Grammar* (1863); *The Apostolical Fathers* (1874); *The Westminster Confession of Faith* (1905); and *Woman: Her Position and Influence in Ancient Greece and Rome, and Among the Early Christians* (1906).

D'OOGHE, MARTIN LUTHER. American scholar and educator, died Sept. 13, 1915. He was born at Zennemaire, Netherlands, in 1839, and graduated from the University of Michigan in 1862. He afterwards studied at the University of Leipzig. In 1867 he was appointed assistant professor of ancient languages at the University of Michigan, becoming acting professor of Greek language and literature there in 1868, professor in 1870, and professor emeritus in 1912. He was ordained to the Congregational ministry in 1878, and in the same year became one of the commissioners of the American School of Classical Studies, at Athens, and was its director in 1886-87. In 1884 he was president of the American Philological Association. He was an editor of Greek classics, the author of *The Acropolis of Athens* (1898), and a contributor to journals and periodicals, classical and archaeological. He received the degree of LL.D. from the University of Michigan, and D.Litt. from Rutgers College.

DOUGHERTY, WILLIAM EDWARD. American soldier, died July 13, 1915. He was born in Ireland in 1841, and was educated in private schools there, in Germany, and in England. He removed to the United States, and on the outbreak of the Civil War enlisted as a private in the United States infantry. He served throughout the war, rising to the rank of first lieutenant. He was appointed brigadier-general, and was retired at his own request, after over 43 years of service, in 1904. He took part in many important actions in the Civil War, and in 1865-66 was provost marshal in Louisiana. He served against the Indians from 1874-82, in Cuba in 1898, and in the Philippine Islands 1901-02.

DOUBINE. See VETERINARY MEDICINE.

DRAINAGE. The year 1915 has been one of comparative inactivity in the drainage of wet lands for agricultural purposes throughout the world. The European war practically stopped such work in belligerent countries and their colonies, and this covers most of the territory in the Eastern Hemisphere where such work was in progress. On the Western Hemisphere the wave of land reclamation, by both irrigation and drainage, which was so acute a few years ago, has subsided to a large extent and attention is being devoted principally to the attempts to utilize the lands made available in the past.

UNITED STATES. Land drainage in the United States is of two classes—(1) the drainage or protection from overflow of lands already occupied and producing some crops, where drainage is merely a means of improvement; and (2) the reclamation of lands which are now unproductive and waste by reason of insufficient drainage or overflow. Work of the former class goes on more or less continuously throughout the United

States without reference to land settlement projects, and was quite active during 1915. Work of the second class, however, seems to have been overdone in recent years, notably where large reclamation schemes in North Carolina, Florida, Louisiana, Arkansas, and Missouri have been undertaken. These projects were engaged in 1915 in efforts to colonize and utilize the lands reclaimed, and in the meantime few new projects were being undertaken.

Drainage reclamation work in the United States is done very largely under drainage district organizations—quasi-municipal corporations which have the power of eminent domain, the power to issue bonds which are a lien on the lands reclaimed, and the power to levy and collect taxes for meeting the cost of constructing, operating, and maintaining drains. Most of the States have such laws. In 1915 Alabama passed a drainage district law, and surveys for the first district to be organized under this law are in progress. The drainage district laws of Georgia and South Carolina have been passed upon and declared constitutional by the Supreme Courts of those States during the year, while the Utah district law is now before the Supreme Court of that State. The Colorado district law is also before the State courts.

The purpose of the drainage district organization is twofold: (1) To make it possible for the owners of wet lands to condemn rights of way for outlet ditches, and (2) to raise funds for the construction of drainage works. In the latter purpose the organizations have been only partially successful. In the reclamation of lands wholly unproductive, the value of the bonds issued depends upon the successful settlement of the reclaimed lands, and these bonds are therefore speculative in character, while the laws usually prohibit their sale below par. Investors are unwilling to assume the risk of such development without the chance for profit made possible by buying the bonds below par, and consequently the bonds are not readily marketable. This condition has led to proposals that the States in some way place their credit behind drainage district bonds, but so far none of the States has done this.

The most notable work of the year in drainage for flood protection is that being done under the Ohio Conservancy act, passed after the disastrous floods in that State in 1913. This law has been tested in the courts of the State and declared constitutional, and districts to carry out the objects of the law have been organized, plans have been made, and assessments for defraying the cost are being levied. Construction has not begun, however. The large drainage enterprises in the Florida Everglades almost ceased activity because of controversies between the State of Florida and the companies carrying on the work, and because of difficulties of selling land and of utilizing the land which had been sold but not completely drained. The reclamation enterprises in the vicinity of New Orleans were proceeding very slowly because the lands were not being taken up and utilized.

In the arid region of the United States there has been considerable activity in the drainage of lands injured by over irrigation and the rise of the ground water due to irrigation and seepage losses from canals. In many of the large irrigation projects begun but a few years ago the ground water has risen so rapidly that large

areas are already unproductive, and the continued use of these lands requires that the surplus water be removed and the ground water level lowered. This is noticeably the case in Western Colorado, Southern Idaho, Northern Wyoming, and many parts of Utah. On many of the government irrigation projects drainage has become necessary, and provision for this is being made. The drainage of irrigated lands presents many new problems, and the United States Department of Agriculture is giving considerable attention to the solution of these problems. During 1915 extensive observations and experiments have been made in the San Luis Valley in Colorado, and in the Snake River Valley in Idaho.

FOREIGN COUNTRIES. As has been stated, the European war has brought drainage reclamation work in the Eastern Hemisphere almost to a standstill. In the irrigated sections of Egypt and India the same trouble with rising ground water and the accumulation of harmful salts, so apparent in the United States, is being experienced, and drainage works have become necessary in connection with most of the large irrigation schemes. In Australia, the states of Victoria and New South Wales are continuing their irrigation work. In New South Wales this work consists of continued construction on the Burrinjuck scheme, while in Victoria the state is engaged in settling and reclaiming the lands supplied with water in former years.

In the Western Hemisphere Argentina is beginning the reclamation of her wet lands, but other than this there is little activity outside of the United States.

DRAMA, AMERICAN AND ENGLISH. The great war cast a shadow over the theatre season of 1915, not only in England, but also in America. In England, creative activity in the drama was brought almost to a standstill. Most of the London theatres remained open, but the majority were given up to the lighter types of entertainment. The most popular plays of the London season were American farces and melodramas, written cheerfully in American slang, and acted with verve and gusto by companies imported from America. With one notable exception, no new plays were brought out by the acknowledged leaders among British dramatists. *The Big Drum*, by Sir Arthur Pinero, which had been begun before the war, was produced early in the autumn by Sir George Alexander. It dealt satirically with the means employed to work up artificial reputations for current novelists by publicity campaigns in the newspapers. The play, as originally produced, ended unhappily; but the author soon substituted a different last act, which ended happily. He stated, as the reason for the change, that he had decided that the war-time audience needed optimism in the theatre even more than logic.

Several war plays were produced in both countries; but none of them really rose to the height of the occasion. One of the earliest of these was called in England *The Man Who Stayed at Home*, and in America *The White Feather*. It was written by Lechmere Worrall and J. E. Harold Terry, and dealt with the discovery of a nest of German spies in a seaside hotel on the east coast of England. A somewhat better play of the same type was *Inside the Lines*, by Earl Derr Biggers. The scene was set at Gibraltar. The hero, an officer in British uniform, was sus-

EXAMPLES OF MODERN STAGECRAFT IN 1915

pected to be a German spy, until in the end he turned out to be a British spy who had merely pretended to take orders from the Wilhelmstrasse in order to convert a German plot to blow up the British fleet in the harbor. More entertaining still was *Under Fire*, by Roi Cooper Megrue, a traditional war play of the secret service type, made alluringly up to date by a skillful localization in Belgium and Northern France. A one-act play, entitled *War Brides*, by Marion Craig Wentworth, which dealt tragically with the misery inflicted on the women of a war-ridden country, was acted with great success by Mme. Nazimova throughout the leading vaudeville theatres of the country. A sombre play, entitled *Moloch*, was written by Beulah Marie Dix. It depicted, in terms a little too abstract, the horror and futility of war. It set forth a powerful appeal for peace; but it failed in the theatre, both when it was produced in Chicago in the spring, and when it was produced in New York in the fall. More ambitious still was *Armageddon*, an attempt by the dramatic poet, Stephen Phillips, to deal with the subject of the war in a large Miltonic manner. This piece was not produced in America, but it was published in both countries. In December, Stephen Phillips died, at the age of 47, and England lost her one poetic dramatist of unquestionable talent. Early in the spring, the American novelist, Justus Miles Forman, hastily wrote a war-play called *The Hyphen*, which dealt with the menace of the German spy-system in America. The play was produced by Charles Frohman; but it had been both written and rehearsed without sufficient preparation, and it failed in the theatre. Shortly afterward, the author and the manager sailed together for England on the *Lusitania*, accompanied by the well-known dramatist, Charles Klein; and all three were killed when the ship was destroyed by a German submarine on May 7th. The loss of these three men was the greatest tragedy of the year in the theatrical world of England and America.

In the American theatre, the most important event of the year was the advent of Granville Barker as a producing manager. Invited to New York by the Stage Society, and backed by the founders of the New Theatre, Mr. Barker installed himself in Wallack's Theatre in January and produced a repertory consisting of *The Man Who Married a Dumb Wife*, by Anatole France, *A Midsummer Night's Dream*, and Bernard Shaw's *Androcles and the Lion* and *The Doctor's Dilemma*. All four plays were admirably acted and beautifully produced; and the repertory ran successfully until April 30th, when it became necessary to vacate Wallack's Theatre because arrangements had previously been made to begin the demolition of the building on the following day. The last night at this historic playhouse was celebrated with appropriate ceremonies. The Barker productions brought the American public face to face with that new stagecraft which, initiated by Gordon Craig, has been gradually developed, in the last dozen years, in Russia, Germany, and England. The purpose of this movement is to make the modern theatre as hospitable to romantic and poetic plays as it is to realistic plays. The essential principles of the new stagecraft are the following: First, a return to the inner and outer stage of the Elizabethan theatre; second, the abolition of foot-

lights and the substitution of overhead lighting; and third, the treatment of scenic backgrounds in a summary and decorative spirit, instead of in the detailed and photographic spirit of the preceding period.

The leading American stage-director, David Belasco, was immediately influenced by these innovations. In the early spring, he produced a romantic play, *Marie Odile*, on an apron-stage devoid of footlights; and in the late summer, he produced a contemporary comedy, *The Boomerang*, on a stage lighted wholly from the top and from the sides. These two pieces, incidentally, must be counted among the very best American plays of the year. *Marie Odile*, by Edward Knoblauch, was a lovely and exquisite work of pure poetic fancy; and *The Boomerang*, a light and alight comedy of love and jealousy, was written with great artistic delicacy by Winchell Smith and Victor Mapes.

The beautiful decorations designed for Granville Barker's productions by the American artist, Robert E. Jones, and the English artists, Albert Rothenstein and Norman Wilkinson, started a new fashion in America, which has been continued by the Viennese, Josef Urban, and the American, Robert McQuinn. The work of the Chicago artist, William Penhallow Henderson, should also be mentioned. Mr. Henderson's chief contribution was the investiture of Alice Gerstenberg's charming dramatization of *Alice in Wonderland*.

Late in the spring, Granville Barker turned his attention to the production of two plays by Euripides, *The Trojan Women* and *Iphigenia in Tauris*, both translated by Gilbert Murray. These plays were given out of doors, in the Yale Bowl, the Harvard Stadium, the Princeton Stadium, the Stadium of the College of the City of New York, and in other large open-air auditoriums. Each performance was attended by from 7000 to 10,000 people; and the enthusiasm of these enormous audiences afforded ample proof that Greek tragedy is still a living art. During the summer, Margaret Anglin was no less successful in producing certain plays by both Euripides and Sophocles in the Greek Theatre at Berkeley, Cal.

Next to these events, the most interesting undertakings of the year were still of the sort that is usually called irregular. The eminent German actor and stage-director, Emanuel Reicher, came to New York early in the year and organized a society called The Modern Stage for the production of several masterpieces of the modern drama. During the course of the season, he exhibited Hauptmann's *Elga*, Ibsen's *John Gabriel Borkman*, Björnson's *When the Young Vine Blooms*, and Hauptmann's *The Weavers*. In acting the part of Borkman, Mr. Reicher made his first appearance in the English language.

A very interesting movement was initiated at the Bandbox Theatre in New York by an enthusiastic group of amateurs calling themselves the Washington Square Players. Their policy is to produce a repertory of one-act plays, four plays to each bill, at the small charge of fifty cents a seat. Their plays are adequately acted, beautifully decorated, and well produced; and their repertory includes already such interesting items as Maeterlinck's *Interior*, Schnitzler's *Literature*, Bracco's *The Honorable Lover*, and *Helena's Husband*, a delightful satire by an American author, Philip Moeller. The work of

the Washington Square Players is symptomatic of a movement that is being taken up in many other cities of America.

In the commercial theatre, Grace George successfully established a repertory company at The Playhouse, in New York. Her first two offerings were revivals of *The New York Idea*, by Langdon Mitchell, and *The Liars*, by Henry Arthur Jones. These were followed by the first American production of *Major Barbara*, by Bernard Shaw, a very witty comedy that had been written as long ago as 1905. Mention should also be made of the installation of a Théâtre Français, at the Berkeley Theatre in New York, where excellent performances of standard French plays were given, in the French language, under the direction of Lucien Bonheur.

Comparatively few new plays of English authorship were presented in America during the course of the year. The best of these were a Lancashire comedy by Harold Brighouse, entitled *Hobson's Choice*, and a comedy of Yorkshire character, entitled *Quinneys*, by Horace Annesley Vachell. Both of these were excellent examples of that racy type of realistic comedy that has been growing up, in recent years, in the British provinces. Alfred Sutro was represented by a clever satiric comedy, *The Two Virtues*, developed from the theme that charity is no less to be desired in a woman than chastity, and by a less successful satire, *The Clever Ones*, which discussed the same theme as *Les Femmes Savantes* of Molière. A new comedy by Henry Arthur Jones, entitled *Cock o' the Walk*, received its first production in America. The material was rather thin, but it was handled with the author's customary skill. It poked fun, in an airily satiric spirit, at the conduct of the theatre-system in London at the present time, with special reference to the coming centenary celebration in honor of Shakespeare.

The most serious, and perhaps the most important, American play of the year was *Children of Earth*, by Alice Brown, which won the prize of \$10,000 which had been offered by Winthrop Ames. It presented a profound study of New England character, and was extremely searching in its psychological analysis; but it failed to interest the public, because its atmosphere was rather gloomy, and because it lacked rapidity of action. *The Shadow*, by Dario Niccodemi, was not of American authorship, but it received its first and only production in America. It was made memorable by the very impressive tragic acting of Ethel Barrymore. Louis K. Anspacher, in *The Unchastened Woman*, presented a very interesting study of a woman of the Hedda Gabler type, who took delight in devastating the lives of all with whom she came in contact. An earlier play by the same author, entitled *Our Children*, was much less valuable. A new writer, Cleves Kinkead, achieved a great success with *Common Clay*, a play more notable for its evident sincerity and earnestness than for its structural development. It discussed the theme that society, in reference to sins of sex, is harder on the woman than on the man, and harder on the poor than on the rich. In *The Eternal Magdalene*, another new writer, Robert McLaughlin, pleaded for greater sympathy toward those unfortunate women who have been required, by the constitution of society, to adopt the oldest profession in the world; but his play was unimaginative and was poorly written.

Considerable delicacy of art was displayed by Charles Kenyon in *Husband and Wife*; but the play failed because the subject-matter was lacking in novelty. Herman Sheffauer's *The New Shylock*, which had been previously produced by Miss Horniman in Manchester, was brought out in New York under the title of *The Bargain*; but, despite the fact that it presented an interesting characterization of a patriarchal Jew, it failed because the plot was badly proportioned. Paul Kester contributed a slight but charming comedy called *Beverley's Balance*, which was delightfully performed by Margaret Anglin. Edward Locke came forward with two plays—a very agreeable comedy of character, called *The Bubble*, and a rather unpleasant study of a runaway wife, entitled *The Revolt*. In *Sinners*, Owen Davis returned to the manner of the cheap melodramas of his earlier career. *The House of Glass*, a successful melodrama by a new author, Max Marcin, developed with considerable skill the conventional story of an innocent woman hounded and haunted by the police. Jules Eckert Goodman, after failing with *The Trap* and *Just Outside the Door*, came forward at the close of the year with an admirable dramatization of *Treasure Island*. In fact, the thoroughly successful transference of Stevenson's great story to the stage was one of the memorable events of the season.

Among the lighter American plays of the year, the most original was *Young America*, by Fred Ballard, a charming comedy of the juvenile court, in which a naughty little ragamuffin was reclaimed by his love for his dog. James Forbes displayed his usual humor in a merry farce about the theatre, entitled *The Show Shop*. Somewhat analogous was a sentimental comedy that dealt with life in and about a metropolitan opera-house: it was entitled *The Great Lover*, and was written by Leo Ditrichstein and Frederic and Fanny Hatton. The successful campaign of the evangelist, Billy Sunday, was turned to the uses of farce by George M. Cohan in *Hit-the-Trail Holiday*. In *Rolling Stones*, Edgar Selwyn added another to the long list of American plays in which a penniless hero makes a fortune in two hours. Avery Hopwood, a deft and witty writer of entertaining farces, scored a great success with *Fair and Warmer*, and was only a little less successful with *Sadie Love*. In *Abe and Mauruss*, Montague Glass and Roi Cooper Megrue wrote a successful sequel to the earlier play of *Potash and Perlmutter*, which had been written by Mr. Glass and the late Charles Klein. *Abe and Mauruss* was not only, like its predecessor, rich in characterization; it was also a well-made play. So much, however, could not be said for *Our Mrs. McChesney*, a somewhat analogous comedy taking up American business-life, by George V. Hobart and Edna Ferber.

The year was marked by a notable increase in the number of published plays: and most of these were real plays—that is to say, plays devised to be presented by actors on a stage before an audience—instead of closet-dramas, merely written to be read. The institution of the *Drama League Series of Plays* and the *Modern Drama Series* appears to have stimulated the further publication of good translations of the best European dramas, and also of good plays of native authorship. An especially useful book was Thomas H. Dickinson's collection of 20 com-

plete plays, entitled *Chief Contemporary Dramatists*.

The study of the drama was also encouraged by the publication of several very valuable studies in contemporary stagecraft. Among these new books, mention must be made of: *The Theatre of To-day*, by Hiram Kelly Moderwell; *The New Movement in the Theatre*, by Sheldon Cheney; *The Modern Drama*, by Ludwig Lewisohn; *Aspects of Modern Drama*, by Frank Wadleigh Chandler; *The Changing Drama*, by Archibald Henderson; and *How to See a Play*, by Richard Burton.

DU BOIS, AUGUSTUS JAY. American civil engineer and educator, died Oct. 19, 1915. He was born in Newton Falls, Ohio, in 1849, and graduated from the Sheffield Scientific School in 1869, later studying mechanics in Germany. In 1875 he was appointed professor of civil and mechanical engineering at Lehigh University, holding this position for two years, when he was made professor of mechanical engineering at Sheffield Scientific School, becoming professor of civil engineering at that institution in 1884. He published several books on engineering subjects, including: *Elements of Graphical Statics* (1876); and *Elements of Mechanics* (three volumes, 1893-95). He edited and translated important engineering works from the German. He also contributed numerous articles to technical journals concerned with the relation of science to the spiritual and supernatural.

DUNKARDS, or DUNKERS. See BRETHREN, CHURCH OF THE.

DURNOVO, PETER NIKOLAIEVICH. Russian statesman, died Sept. 24, 1915. He was of a noble family of the Province of Chernigoff, and first became prominent while minister of the interior, during the repressions that followed the "Charter of Liberties" granted by Alexander III. He entered the government as an official of the interior department, later joining the police department, of which he finally became head. Following scandals in the department, he was dismissed, and for a time disappeared from sight, emerging as governor of one of the Volga Provinces under Nicholas II. He was made head of the department of posts and telegraphs shortly before the Russo-Japanese War. When Plehve was killed, he was appointed minister of the department of the interior to take the latter's place, resigning in May, 1906, as a result of disloyalty which, Witte declared, Durnovo showed toward him. He later became a member of the Council of the Empire, and in March, 1911, in company with Trepoft, was suspended from all sittings of the Council until January, 1912, at the instigation of Premier Stolypin.

DUTCH EAST INDIES. Possessions of the Netherlands, lying between Australia and the Asiatic continent. Capital, Batavia.

AREA AND POPULATION. The Dutch East Indies consist of two main divisions: (1) Java (16 residencies) and Madoera (1 residency); and (2) the outposts (17 provinces). Area and population (for the outposts approximate) of

Java, Madoera, and the outpost provinces at the end of 1905 are given in the table below:

	Sq. m.	Pop.
Java	48,686	28,604,719
Madoera	2,090	1,493,289
<i>Outposts</i>		
<i>Island of Sumatra:</i>		
Sumatra, West Coast	31,788	
Padang Highlands		408,431
Padang Lowlands		905,040

Bali and Lombok	4,063	523,535
Total	739,547	37,979,377

* Consists of Indragiri in Sumatra and the Riouw and Lingga archipelagoes. † Included in Ternate are a part of eastern Celebes Island, Dutch New Guinea, and a part of the Moluccas; the rest of the Moluccas are in Amboina. Dutch New Guinea extends to 141° E., with estimated area 152,428 square miles and estimated population 262,000.

The native population (exclusive of New Guinea) numbered 37,020,460 (Java and Madoera, 29,715,908); Europeans, 80,910; Chinese, 563,449; Arabs, 29,588; Orientals, other than natives, 22,970. Batavia had 138,551 inhabitants; Semarang, 96,600; Pekalongan, 41,719; Djokjakarta, 118,378; Padang, 91,440; Palembang, 60,985; Bandjermasin, 16,708.

PRODUCTION. Area (1912) under rice, 3,342,084 bahoes (1 baho = 1¼ acres); production, 85,514,914 piculs; sugar cane, 281,994 (sugar production, 21,562,047 piculs); tobacco, 262,736; indigo, 14,583; other cultures, 3,704,660. Government coffee plantations (Java), 59,526 bahoes (production, 81,000 piculs); production from emphyteutic lands, 272,000; from private estates, 29,000. Tobacco: 30,673,631 kilos in Java, and 19,965,896 in Sumatra. Tea (Java), 29,412,704 kilos; cacao, 2,272,953 kilos. Tin from the government mines at Banka in 1911-12, 250,496 piculs; from private mines (as Billiton and Riouw), 76,914; total tin production, 1912-13, 20,219 tons. Coal production (1912), 673,121 metric tons; petroleum, 1,518,044 tons. Gold, silver, diamonds, copper, and manganese are mined.

COMMERCE. Government and private trade, merchandise and specie, are given for three years (in florins):

	1908	1912	1913
<i>Imports</i>			
Government:			
Merchandise ..	7,667,549	20,229,755	27,021,000
Specie	8,850,000	5,170,000	4,419,000
<i>Private:</i>			
Merchandise ..	243,544,983	380,669,597	437,903,000
Specie	20,499,027	29,553,007	23,998,000
Total	280,561,559	435,622,359	493,341,000
<i>Exports</i>			
<i>1912</i>			
<i>Government:</i>			
Merchandise ..	16,856,649	51,411,500	51,231,000
Specie		609,072	

Exports	1908	1912	1913
Private:			
Merchandise	452,823,832	533,617,014	620,504,000
Specie	1,084,623	1,410,614	6,211,000
Total	470,714,604	587,048,200	688,946,000

The Netherlands is the important country of destination for exports, which consist mainly of sugar, coffee, tea, indigo, cinchona, tobacco, copra, and tin. A large export of rice goes to Borneo and China. There were entered at the ports in the 1913 trade, 6253 steamers, of 5,046,000 tons, and 2664 sailing vessels, of 192,000.

Railways in operation (1913), 1721 miles; government telegraph and cable lines, 12,319 miles.

FINANCE, ETC. Estimated revenue, 1915, 309,429,094 florins (1914, 295,229,458); expenditure, 338,440,625 (338,774,555). A. W. F. Idenburg was appointed governor-general, Aug. 20, 1909.

DUTCH GUIANA, OR SURINAM. A colony of the Netherlands (between 46,000 and 49,000 square miles) on the northern coast of South America. Population (1910): 913 Europeans, 7894 Dutch East Indians, 19,683 British East Indians, 52,369 indigenous, 3643 other; total (exclusive of negroes in interior forests), 86,233. Of these, 36,480 are classed without occupation. Total at the end of 1913, 86,134. Immigrants employed under contract on plantations, Dec. 31, 1910, 11,561. Sugar production, 1912, 9,634,400 kilos (1910, 12,015,100); molasses, 197,100 litres (164,100); rum, 989,900 litres (797,800); cacao, 864,000 kilos (1,683,000); coffee, 196,900 kilos (202,300); corn, 1,290,600 kilos (1,323,000); rice, 2,659,300 kilos (1,993,700). Gold yield, 743,199 grams (1,081,476), valued at 1,081,183 florins (1,481,622); gold export, 981,588 florins (1,446,073). Total imports, 1912, 7,494,063 florins (1910, 424,698); exports, 6,619,937 (8,345,447). Tonnage entered, 211,214. Revenue and expenditure (provisional), in 1914, 6,262,000 and 7,052,000 florins, respectively; subvention, 790,000.

DYCHE, LOUIS LINDSAY. American zoölogist, educator, and explorer, died Jan. 20, 1915. He was born at Berkeley Springs, W. Va., in 1857, and graduated from the University of Kansas in 1884. After post-graduate studies at that university, he was appointed assistant professor of zoölogy in 1885, becoming in the following year professor of comparative anatomy, in 1890 professor of zoölogy and curator of birds and mammals, and in 1900 professor of systematic zoölogy and taxidermy. He made over twenty scientific expeditions; hunted all over North America from Mexico to Alaska; and was a nimrod also, in Greenland and the Arctic regions. These activities resulted in one of the largest and finest collections of North American mammals in the world. It became the property of the University of Kansas. He was the author of many articles on the subjects that chiefly interested him in scientific publications and other periodicals.

DYNAMO-ELECTRIC MACHINERY. While there was only a slight increase in the capacity of the largest electric generators built in 1915 over those constructed in the previous years, large, high capacity machines were built

in greater quantity. At the close of the year an order for a 45,000 K. V. A. turbo-unit was announced, this being the largest ever constructed. The 35,000 K. V. A. generating set mentioned in the 1914 YEAB BOOK as being installed by the Philadelphia Electric Company was put in service early in 1915. In New York City, the substitution of turbine for reciprocating engine-driven generating sets was continued by the New York Edison and Interborough Rapid Transit Companies, the last named replacing, on the same floor space, four 7500 K. V. A. engine-driven units with three turbo generator sets, each one of which had a rating equal to that of all four old units combined, thus trebling the station capacity without enlarging the building.

Near Newark, N. J., the Public Service Corporation, supplying light and power throughout a large territory in that part of the State, was completing during the latter part of the year a power station in which the initial installation comprised two 25,000 kilowatt sets. The Detroit, Mich., Edison Company was building a power plant at Conners Creek, designed to comprise six 25,000 kilowatt units. In Toledo, Ohio, the Toledo Street Railways and Light Company started the operation of a 20,000 kilowatt generator in the Water Street station. This company also began the remodeling of its Detroit Avenue station, substituting turbo-generator units for engine-driven sets so as to secure a larger power output from the same floor space. The Chicago Edison Company ordered a turbo-generator set of 35,500 K. V. A. capacity of a type similar to those installed by this company recently, consisting of a Parsons type steam turbine directly connected to a three-phase 60-cycle alternating current generator. At Detroit, Mich., the Ford Motor Car Company put into use early in the year the largest continuous current generator ever built. It had a normal rating of 3750 kilowatts with a maximum capacity of 4500 kilowatts. Its armature was about 16 feet in diameter, and weighed 42½ tons. The largest generators ever built for operation by water turbines were those installed during the year at Rjukan, Norway, and near Spokane, Wash., the former being rated at 17,000 K. V. A., and the latter at 13,900 K. V. A.

There was little change in the design or size of alternating current motors installed for industrial uses during the year, and while for mill and factory purposes the induction motor was the commonest type, there were many cases where the synchronous machine was preferred by engineers. A new field for the application of induction motors was opened by the satisfactory performance in service of motors of this kind for the "split phase" system on the Norfolk and Western Railway electric locomotives. (See ELECTRIC RAILWAYS.)

The United States Navy Department began the installation in the superdreadnought *California* of two steam turbo-generator units for furnishing energy to four electric propelling motors, the largest electric ship propelling plant ever built. The two generating sets were designed for a capacity of 37,000 horse power in order to furnish energy for operating the ship at 22 knots speed. The propeller motors were rated normally at 7500 horse power and were to operate at 4000 volts with 25 cycle, quarter phase alternating current, being so wound that connection can be made for using either 24 or 36 poles. The ob-

ject of this was to secure more economical operation at cruising speeds of 15 knots or less, as under these conditions only one generator will be required and the motors will be on the 36-pole connection, and it was expected that even under these conditions the ship would be able to make 18.5 knots per hour. The exciting generator units of 300 kilowatts each were also to be turbine driven. See also **BATTLESHIPS**.

EARTH, AGE OF. See **GEOLOGY**.

EARTHQUAKES. Central Italy was visited by a heavy earthquake on Jan. 13, 1915, which proved to be one of the most disastrous occurrences of recent record, as measured by the loss of life, which was placed at over 30,000. The devastated region included the mountain districts of the Abruzzi, with the epicentral tract close to the city of Avezzano, where about 90 per cent of the 11,000 inhabitants were reported to have been killed. Pescina had 4500 victims, and some of the villages in the vicinity were literally wiped out, only piles of debris remaining to mark their sites. In completeness of devastation the earthquake probably has had no equal within recent times, although the loss of life was not so large by half as in the Messina disaster. The area of damage extended across the peninsula from Rome on the west, to Chieti on the Adriatic side, a distance of 110 miles, and from Ancona, Perugia, and Grosseto on the north, to Naples and Potenza on the south, in all an area of 56,000 square miles. The main shock was followed by two lighter ones in rapid succession; and minor disturbances were felt for several days, as many as 120 having been recorded at Rome in the first 48 hours. Despite its destructiveness, the disturbance was not of extraordinary violence in the estimation of seismologists; the great loss of life was rather the result of the poor type of construction of the buildings in that part of Italy, the houses being built mainly of stones joined with a little cement. Heavy shocks have not been common there, as the region lies to the north of the main seismic zone in which they usually originate.

Otherwise the year's record was uneventful, although mention may be made of one or two occurrences that possessed local interest. A moderate shock was felt in Southern California, Western Arizona, and the adjacent part of Mexico, arousing some apprehension for the safety of the great irrigation system of the Imperial Valley, which, however, was only slightly damaged. The few fatalities were confined to the Mexican town of Mexicali and were incident to the collapse of buildings. Current opinion seemed to have connected the disturbance with a reopening of the San Andreas fault, in the same way as the San Francisco disaster may be traced to a slipping of the earth on opposite sides of that fracture. There was really no basis for such a view, however, for the fault, so far as can be seen, terminates in Ventura County and lies close to the coast throughout its extent. Slight tremors were reported on December 7th from various parts of the Mississippi Valley from Illinois south to Tennessee and Arkansas.

EAST AFRICA PROTECTORATE. The territory lying between the Umba and Juba rivers, from German East Africa to Italian Somaliland and Abyssinia, and inland to Uganda; a British dependency. Estimated area, about 200,000 square miles, inclusive of coast territory

leased from the Sultan of Zanzibar. The population is estimated at about 4,000,000, including about 25,000 Asiatics and 3500 Europeans. Mombasa, the largest town and chief port, has a population of about 30,000 (230 Europeans). Nairobi (14,000 inhabitants, of whom about 800 are Europeans, and over 3000 Indians) is the administrative headquarters and the central station of the Uganda Railway. At Kilindini improvements are in progress that will make it the finest harbor on the east African coast and the centre of trade for equatorial Africa. In 1912, of the 338,033 acres (9844 freehold, 328,189 lease) classed as productive, 310,145 were devoted to grazing, 27,888 to crops. Cattle, sheep, and ostriches are raised. The crops include grains, coconuts, cotton, sisal, rubber, tobacco, coffee, and fruits. The worked mines yield carbonate of soda, limestone, graphite, and gold. The cost of construction of the Uganda (Mombasa-Victoria) Railway (602 miles) to March 31, 1914, was approximately £6,289,917. Four steamers are operated on Victoria Nyanza in connection with the railway. Railway passengers carried (1913-14), 616,197; tons of goods, 189,556; revenue, £546,345; expenditure, £322,861. The telegraph system, exclusive of the lines in Uganda, has 2302 miles of line (the railway line has three wires). Commercial and financial figures follow:

	1908-9	1909-10	1910-11	1913-14
Imports ..	£ 797,158	£ 775,246	£1,000,846	£2,147,937
Exports ..	436,818	590,057	962,911	1,482,876
Revenue ..	485,668	503,089	609,585	1,123,789
Expenditure	703,103	669,404	682,041	1,115,899
Gr't-in-aid.	138,000	133,500	130,000	
Shipping *	1,838,159	1,914,153	1,364,740	1,791,081

* Tonnage entered at Mombasa and Kilindini.

The import figures are exclusive of railway material, government stores, and specie. The United Kingdom supplied imports to the value (1913-14) of £907,410, and received exports valued at £686,643; British possessions, £433,337 and £118,451; Germany, £194,514 and £219,523; the United States, £170,864 and £95,976; the Netherlands, £101,050 imports; France, £207,414 exports.

EASTLAND DISASTER. See **SAFETY AT SEA**.

ECONOMIC ASSOCIATION, AMERICAN. The twenty-eighth annual meeting of the association was held at Washington, D. C., from Dec. 27 to 30, 1915. The American Historical Association, the American Statistical Association, the American Sociological Society, the American Political Science Association, the American Association for Labor Legislation, the Nineteenth International Congress of the Americanists, the American Society of International Law, the Naval History Society, the American Folk-Lore Society, the American Anthropological Association, the Archaeological Institute of America, and the Mississippi Valley Historical Association also held their annual meetings at the same place and time. Among the papers and addresses were the following: "Probable Changes in the Foreign Trade of the United States Resulting from the European War," by Emory R. Johnson; "The Value of Archives to the Student of Economics," by Frank W. Taussig; "The Apportionment of Representatives," by Walter F. Wilcox; "The Economic Costs of War," by John Bates Clark

and W. S. Rossiter; "Economic Theorizing and Scientific Progress," by J. H. Hollander. Papers or speeches were also given by G. Hunt, B. F. Shambaugh, Waldo G. Leland, Leo F. Stock, Louis A. Simon, W. M. Stephens, B. H. Meyer, W. C. Mitchell, Willard Straight, and G. E. Roberts. The officers of the association for 1915: Walter F. Wilcox, of Cornell University, president, and Allyn A. Young, of Cornell University, secretary and treasurer.

ECONOMICS, HOME. See **FOOD AND NUTRITION.**

ECONOMICS, SOCIAL. See **SOCIAL ECONOMICS.**

ECUADOR. A South American republic between Colombia and Peru. Capital, Quito.

AREA AND POPULATION. The eastern limits of the republic are not definitely established, but, pending a settlement of the boundary disputes with Colombia and Peru, the area is stated at 299,600 square kilometers (115,676 square miles); or, including the Galápagos (about 730 miles off the coast), 307,243 square kilometers (118,627 square miles). The republic is divided into 17 provinces. The population in 1903 was placed at 1,272,000; an estimate of 1910 is 1,500,000. The majority of the people are Indians, and there are perhaps 400,000 mestizos; the proportion of pure white inhabitants is very small. Much uncertainty exists in respect of urban population; Guayaquil is supposed to have upwards of 80,000 inhabitants; Quito, about 70,000; Cuenca, over 40,000; Riobamba, about 18,000; Puertoviejo, Ambato, Loja, and Ibarra, each about 10,000.

EDUCATION. Illiteracy is prevalent, though primary instruction is free and nominally compulsory. A report of the minister of public instruction, published in 1915, gave the number of primary schools as 1231, with an enrollment of 95,019. State schools numbered 1054, with 72,655 pupils; municipal schools, 92, with 12,009 pupils; and private schools, 85, with 10,355 pupils. For secondary instruction there are 12 institutes supported by the government, besides commercial and technical schools at Quito and Guayaquil. For higher and professional education there are universities at Quito, Guayaquil, and Cuenca. There is also a law college at Loja. The state religion is Roman Catholicism.

PRODUCTION AND COMMERCE. The most important crop is cacao, for which Ecuador supplies a large part of the world's demand, though the proportion is smaller than formerly; the average Ecuadorean output has not declined, but that of other countries, notably Brazil, has in recent years increased. In 1913, 85,908,495 pounds of cacao were delivered at the port of Guayaquil; the quantity sent to other ports for shipment is comparatively small. Other products of account are coffee, rice, sugar cane, tobacco, ivory nuts, and rubber. The rubber industry has suffered from the thriftless exploitation of the trees. A large part of the ivory nuts was taken by Germany, and the export of that product declined upon the outbreak of the great German war. Ecuador has valuable mineral resources, but they have not been largely exploited. Manufactures have little commercial importance, except Panama hats, which are produced in large numbers.

The reported value of imports and exports, respectively, in 1911, was \$11,489,104 and \$12,692,237; in 1912, \$10,354,564 and \$13,689,696;

in 1913, \$8,836,689 and \$15,789,367; in 1914, \$8,402,767 and \$13,061,566. The principal imports are cotton and woolen fabrics, foodstuffs, hardware, machinery, wines and liquors, ready-made clothing, etc. The chief export is cacao; other exports of some importance are Panama hats, ivory nuts, rubber, gold, and cattle hides. Trade by principal countries, in thousands of dollars:

	Imports		Exports	
	1912	1913	1912	1913
United Kingdom	3,058	2,618	2,042	1,620
United States	2,687	2,818	3,957	3,834
Germany	2,105	1,563	1,523	2,827
France	616	435	4,097	5,382
Total, including other	10,355	8,837	13,690	15,789

COMMUNICATIONS. The length of railway in operation in 1912 was about 370 miles; of this, 297 miles are comprised in the line from Durán (opposite Guayaquil) to Quito. This line was opened in June, 1908, and since has been worked at a heavy loss, in fact not earning interest upon its bonds, so that the track cannot be maintained in a proper state of repair, and breakdowns and serious accidents are of frequent occurrence. Previous to the outbreak of the European war a German firm secured a contract from the government to build a line from Huigra to Cuenca, and this would have had considerable effect on the prosperity of the country. A railway (19 miles) extends from Puerto Bolívar to Machala, Pasaje, and Guabo. There are under construction: a line from Manta, on the coast, to Santa Ana; a line from Bahía de Caraquez to Quito; a line from Ambato to Curaray; and a coastal line from Guayaquil to Salinas. At the end of 1912, there were 3318 miles of telegraph line, with 188 offices. There are six radiotelegraph stations. Post offices, 151.

FINANCE. Gold is the standard of value. The sucre is the monetary unit; it has a par value of 48.665 cents, being one-tenth of the Ecuadorean condor or of the British sovereign. Revenue and expenditure are reported as follows, in thousands of sucres (the figures for 1915 are estimated):

	1911	1912	1913	1914	1915
Revenue	13,264	19,973	20,140	20,996	20,880
Expenditure	15,836	19,950	21,503	20,760	20,880

The chief items of revenue are import duties (8,155,620 sucres in 1912) and export duties (4,598,408). The larger disbursements in 1912 were: for the public debt, 6,927,348 sucres; war and marine, 3,411,810; public instruction, 1,844,698; interior and police, 1,561,325. Public debt, Jan. 1, 1914: foreign, 28,027,400 sucres; internal, 14,114,420; total, 42,141,820.

GOVERNMENT. The executive authority is vested in a President elected by direct vote for four years. He is assisted by a cabinet of five ministers. The Congress consists of two houses, the Senate (32 member, elected for four years) and the Chamber of Deputies (48 members, elected for two years). For the term beginning Aug. 31, 1911, Emilio Estrada was inaugurated President in succession to Gen. Eloy Alfaro. The death of Estrada, Dec. 21, 1911, was followed by a revolutionary outbreak headed apparently by friends of Alfaro (who was killed). On March 31, 1912, the commander of the government forces, Gen. Leonidas Plaza, was elected

President, and on the 31st of August following was inaugurated for a four-year term. Plaza was President in 1901-05.

HISTORY. *End of the Revolution.* The revolution in Ecuador which began in December, 1913, under the leadership of Col. Carlos Concha was thought to have reached an end late in February, when Colonel Concha was captured near Esmeraldas. A report to the State Department in Washington stated that the government "considers this of great importance and that it means the collapse of the revolutionary movement." (See YEAR BOOK, 1914.)

Political and Economic Conditions. Ecuador was represented at the Pan-American Financial Conference, in Washington, in May, by E. Gallardo and V. Gonzales. The principal duty of these delegates was to acquaint the members of the Conference with facts concerning the Guayaquil and Quito Railroad, an American-owned line, which had failed to make several payments of interest on bonds. These bonds were owned mainly by European investors who, as security, held a lien on the entire customs receipts of the country. Ecuador claimed that it was experiencing difficulty with the line and could not make it pay the interest. The committee appointed by the conference to consider the matter accepted the report made by the Ecuadorean delegates. The war in Europe brought about a deficit in the revenues of Ecuador estimated at \$2,000,000. In order to make up this deficit the government endeavored to establish a market in the Western Hemisphere for Ecuadorean products. In July an effort was made to encourage trade between Chile and Ecuador by an exhibit of Chilean goods at Quito. An executive decree convened Congress on August 10th. The session was chiefly concerned with measures to improve the economic condition of the country.

EDISON BATTERY. See ELECTRIC BATTERIES.

EDUCATION. See section so entitled under various foreign countries and under States of the United States.

EDUCATION IN THE UNITED STATES. **STATISTICS.** *Attendance in Elementary and Secondary Schools.* The latest report of the United States Commissioner of Education gives the statistics for the year 1913. It shows that there were in the elementary schools, including kindergarten, primary, and grammar grades, a total of 19,084,787 pupils. Of this number, 17,474,269 were in public, and 1,590,518 in private, schools. There were 1,134,771 secondary students in public institutions, and 148,238 in private schools. There were also 83,813 secondary students in the preparatory departments of higher institutions. In miscellaneous schools of elementary and secondary rank there were 839,634 students. A total of 21,271,243 students received formal instruction in elementary or secondary subjects during 1913. Compared with the total population of the country, in each thousand persons 196 were in the elementary school and 14 were in the high school. The public provided instruction for 180 of the 196 elementary pupils and for 12 of the 14 high school students.

The length of school term varied from 91 days to 194 days. The average for all of the States was 158 days. The average number of days' attendance in public schools for each child between the ages of 5 and 17 years inclusive varied from 41 days in South Carolina to 112

days in California. The average for the whole country was 84 days. All but three States, Georgia, Mississippi, and Alabama, now have compulsory school attendance laws. In Idaho the compulsory attendance age is from 8 to 17 years inclusive. In a few States the limits are from 7 to 15 years, in others from 8 to 15. The minimum period of compulsory attendance each year varies from 24 weeks to the full school year.

Of each thousand pupils in the elementary school 235 were in the first grade, 150 in the second, 139 in the third, 133 in the fourth, 112 in the fifth, 92 in the sixth, 76 in the seventh, and 63 in the eighth. The number registered in the first grade does not represent the number who are beginning school. It is usually estimated that one-half of the first grade enrollment is composed of those who repeat the grade or are retarded. Taking this assumption as the basis, it would seem that less than one child in four who enters the first grade reaches the high school and that only about 109 out of every thousand who enter first grade graduate from the high school.

Teachers in Elementary Schools and High Schools. The public elementary schools employed 89,801 men and 421,944 women as teachers. The public high schools employed 23,412 men and 30,326 women. In addition it is estimated that 41,831 teachers were employed in private elementary schools and 13,358 in private high schools. In three years—1910 to 1913—the number of public elementary school teachers was increased 6 per cent. The increase in number of children enrolled was 5 per cent. During the same time the number of high school students increased 21 per cent but the number of high school teachers increased 29 per cent.

Costs of State Common Schools. The total expenditure for the common schools in 1913 was \$521,546,375, or \$5.37 per capita of total population. Of each \$100 secured for school purposes \$4 came from income of permanent funds or rents, \$15 came from State taxes, \$74 from local taxes, and \$7 from other sources. It cost an average of \$38.31 for each pupil in average attendance. Of this amount \$6.14 was used for sites and buildings, \$22.36 for salaries, and \$9.81 for all other purposes. The per capita cost for high school students during the year ending June, 1914, was \$57.02.

In a recent report of a survey of the San Antonio school system Prof. J. F. Bobbitt presents as an "index of community valuations" some tables which give the costs of teaching various high school subjects. The following table is compiled from data which he presents:

	Cost of instruction in per cents	Cost of instruction per student hour
English Composition and Literature	20.4	6.7
Higher Mathematics	17.0	6.9
The Sciences	13.1	6.8
History and Civics	10.6	8.3
Modern Languages	10.3	11.4
Household Occupations	9.7	8.3
Shopwork and Mechanical Drawing	6.3	10.3
Commercial Subjects	5.3	10.3
Latin	5.2	10.3
Public Speaking	1.9	9.8
Music	.4	4.0
Physical Training	.0	
Drawing and Design (not Mechanical)	.0	
Training of Elem. Teachers...	.0	

The table should be read as follows: San Antonio devotes 20.4 per cent of all the expense of instruction to English composition and literature. For each student it costs 6.7 cents for each hour of instruction in English. Professor Bobbitt implies that because the community is willing to pay 11.4 cents per student per hour for instruction in modern languages and only 6.8 cents for the instruction in sciences they value modern languages more highly than sciences.

BUREAU OF RESEARCH AND EFFICIENCY. In the past four years nine cities have established departments or bureaus of research and efficiency in connection with their public schools. These cities and the dates of the establishment of the bureaus are as follows: Rochester, N. Y., 1911; Baltimore, Md., 1912; New Orleans, La., 1912; New York City, 1913; Boston, Mass., 1914; Kansas City, Mo., 1914; Detroit, Mich., 1914; Oakland, Cal., 1914; Schenectady, N. Y., 1914. In each case the aim is to have a constant investigation of the school system. The following quotation from the annual report of the Superintendent of Schools of Kansas City gives the aims and functions of the bureau established in that city: "The purpose of this bureau is to assist in discovering better methods of administering and supervising our schools, and better methods of teaching the various subjects of the curriculum. It is hoped that such plans and methods may be discovered as will secure the best results from the given factors.

"The plan throughout will be coöperative. . . . It shall be the function of this bureau to bring together the results of efforts at improvements and so tabulate and arrange the data that those interested may know the facts that have been revealed by any investigations that are undertaken and be able to judge in a better way the value of the conclusions reached. A further aim will be to so democratize the school system and so plan the work that the humblest teacher in any grade may contribute the results of her work to the advancement of the system. . . .

"While ill-advised and unorganized experimentation will not be undertaken, much liberty will be allowed in working out problems along safe and conservative lines. . . ."

While the above statement describes in a general way the work of this bureau, we might enumerate specific functions as follows:

First: To measure and tabulate the results that are now being secured in our schools. During the first year we hope to do some work in measuring the results in writing and arithmetic and possibly also in spelling and language.

Second: To study the results of the work of similar bureaus in other cities and bring to Kansas City the best conclusions of those bureaus.

Third: To coöperate in the investigation of any problem that may confront the board of education, the superintendents, the supervisors, the principals, the teachers, or the people.

Fourth: To tabulate and analyze all statistical reports.

Fifth: To study methods of reducing waste in the school system.

Sixth: To study with the principals and the teachers plans for reducing elimination of pupils, non-promotion of pupils, and failures of pupils.

Seventh: To coöperate with all the depart-

ments of the school system in efforts to increase efficiency.

EDUCATIONAL INVESTIGATIONS AND SURVEYS. The Survey Committee of the Cleveland Foundation assisted by the Russell Sage Foundation conducted a very thorough survey of the schools of Cleveland, Ohio. The report of the survey is contained in 25 small volumes which may be obtained either from Cleveland Foundation or from the Russell Sage Foundation, New York. Professor John F. Bobbitt, of the University of Chicago, investigated the schools of San Antonio, Texas. During December, 1915, the city of Boston employed a group of educational experts to investigate the management of the city schools. The report of this investigation is not yet printed. The Carnegie Foundation for the Advancement of Teaching is conducting an exhaustive survey of the teachers' training institutions of Missouri. During the month of May the public school system of Salt Lake City, Utah, was surveyed by a staff under the direction of Ellwood P. Cubberley, Leland Stanford University.

There are evidences that interest in investigations such as have been conducted is decreasing. The recent investigations have failed to develop any new plans of procedure or to suggest specific remedies for defects other than those found in certain administrative matters. The outcome of many of the investigations has been the creation of a distrust on the part of the public for their school officials and teachers. This may be wholesome in the end but the immediate results have in many cases been unfortunate.

INDUSTRIAL EDUCATION SURVEYS. Several cities, notably Richmond, New Orleans, and Minneapolis, have begun or completed very comprehensive investigations of their industries as related to industrial education. After considering such questions as conditions of employment, wages, hours of labor, entrance age, etc., the findings in the Richmond investigation present the education requirements for operatives in the various trades. It shows what the worker needs to properly equip him for the trade, what training the industry gives, common deficiencies of workmen, and ends with suggestions as to what the school ought to give. The industrial survey of Minneapolis seeks to find, first, to what extent the worker can "get on" in his job; second, to what extent the city's industries may give special training which they do not now provide; third, to what extent can the schools be a factor. The National Society for the Promotion of Industrial Education is directing the survey. Dr. Charles A. Prosser, Director of the William Hood Dunwoody Industrial Institute of the city of Minneapolis, is director. The Minneapolis School Board, the Dunwoody Industrial Institute, the Minneapolis Art Institute, and the Civic and Commerce Association are coöperating.

MONTESORI SCHOOLS. Dr. Montessori began her experiments with normal children in Rome in the Case dei Bambini (children's houses) in one of the tenement sections. She had previously experimented with defective children and found that by using methods that developed the senses and by following the child's development she was able to accomplish almost as much with these children as was ordinarily accomplished by the regular schools with normal children. In 1909 she published the outcome of her observations and experiments in a book entitled *The*

Method of Scientific Pedagogy Applied to Infant Education. Her training in medicine and psychiatry enabled her to apply the method of experimental science to the study of education. The following quotation presents in brief form her method: "Give the best conditions of life, and then, as is done with other living organisms, give freedom for development, disturbing as little as possible, observing, certainly helping, by every means, in this development." The distinctive features of the method are an insistence upon sense education and muscular training. She emphasizes freedom for the children and demands that the teacher shall observe them and assist them but not prescribe what shall be done. By the use of various materials which can be used in only one way the child is led to correct himself. This, according to Madame Montessori, provokes "auto-education" and because the material does the teaching she calls it "the didactic material." It is claimed that children learn the ordinary school subjects rapidly and easily after the preliminary training afforded by this method.

The Montessori movement in America began in 1911. From that time on many American teachers and others interested in education visited the Montessori schools in Italy and Switzerland. Miss Anna E. George, who had previously studied and observed in the Montessori schools, translated Madame Montessori's book, and opened a Montessori class in Tarrytown, N. Y., in October, 1911. In 1912 the Montessori American Committee was formed. This committee helped to arrange the first International Teachers' Training course at Rome. Of the 100 students in attendance nearly 70 were Americans. In May, 1913, the National Montessori Educational Association was formed with headquarters in Washington. The purpose is "to promote and develop in America the educational movement based on the principles and theories of Dr. Montessori, and to assist in the establishment and maintenance of schools for children and schools of observation and practice conducted according to said principles." The association now has a membership of more than 700.

Dr. Montessori visited the United States in 1913 and again in 1915. During her last visit she conducted a teachers' training institute in connection with a model class at the Panama Exposition. No available data concerning the number of Montessori schools in America are available. It is certain that a considerable number of teachers have been influenced by her method and in their own work, largely in private schools, have modified their practice in accordance.

ORGANIC EDUCATION. Mrs. John F. Johnson is developing a method of school instruction and organization at Fairhope, Ala., that is now commanding the attention of the school authorities. Schools similar to hers have been established in various parts of the United States. Each summer she conducts a teachers' training course in connection with a model school at Greenwich, Conn. "She calls her methods of education 'organic' because they follow the natural growth of the pupil. The school aims to provide for the child the occupations and activities necessary at each stage of development for his unfolding at that stage. Therefore, she insists that general development, instead of the amount of informa-

tion acquired, shall control the classification of the pupils. Division into groups is made where it is found that the children naturally divide themselves. These groups are called 'Life Classes' instead of grades. The first life class ends between the 8th and 9th years; the second between the 11th and 12th, and since an even more marked change of interests and tastes occurs at the period of adolescence, there are distinct high-school classes. The work within the group is then arranged to give the pupils the experiences which are needed at that age for the development of their bodies, minds, and spirits."

In place of the typical primary curriculum she has the following activities: Physical exercise, nature study, music, hand work, field geography, story telling, sense culture, fundamental conceptions of number, dramatizations, and games. As much as possible of this work is conducted out of doors. In the ordinary school the gymnasium work comes at a time when the child is fatigued with his study. In Mrs. Johnson's school the gymnasium work, which is informal, may come the first thing in the morning. In place of being forced to learn the "three R's," the child is led into reading, writing, and arithmetic by his own desire to know. Mrs. Johnson is not disturbed if a child does not learn to read until he is eight or nine years old.

Mrs. Johnson has not formulated her work into any system, so it is impossible to state the principles by which she works. The best description of her work is found in *Schools of Tomorrow*, by John Dewey.

VOCATIONAL EDUCATION. There was no change during 1915 in the number of States having systems for organizing and supervising vocational schools and for assisting local communities in the maintenance of such schools through grants of State aid. The States having such systems are: Massachusetts, New York, New Jersey, Pennsylvania, Wisconsin, and Indiana. In each of these States administration is effected through the office of a special deputy or expert assistant attached to the staff of the State Superintendent of Public Instruction or Commissioner of Education.

Federal Aid for Vocational Training. The Smith-Lever Act, approved by the President on May 8, 1914, provides for "coöperative agricultural extension work which shall consist of the giving of instruction and practical demonstrations in agriculture and home economics to persons not attending or resident" in the agricultural colleges. The appropriations provided by this act go to the State agricultural colleges which are required to make plans for the work subject to the approval of the Secretary of Agriculture. During the current fiscal year each State had \$10,000 from this fund. The general plan for conducting the extension work consisted in, first, locating extension agents in several counties of the State to carry on demonstrations, advise the agricultural people and stimulate them to better methods; second, the organization of boys' and girls' clubs, largely in connection with the rural schools, to conduct some simple agricultural or home economics project; third, the organization of a staff of specialists in agriculture and home economics as a part of the faculty of the agricultural college. These specialists go about the State and assist the extension agents. Agents are now located in more

than 1000 counties out of the 3000 in the United States.

The Smith-Lever Bill provides "\$10,000 annually to each State for its Agricultural College beginning July 1, 1914. For the year beginning July 1, 1915, it provided \$600,000 additional to be allotted to the various States in the proportion which the rural population of each State bears to the total rural population of the United States; and for each succeeding year for seven years an additional amount of \$500,000 allotted on the same basis. By July 1, 1923, this will amount to an annual appropriation of \$4,100,000 in addition to the \$10,000 to each State. None of this amount will be paid to any State (excepting the \$10,000 annually) unless the State makes an equal appropriation. Both the fund received from the Federal government and the equal fund from the State government to balance it must be expended on extension schemes approved by the United States Department of Agriculture."

The Smith-Hughes Bill for national aid to vocational education was before the Sixty-third Congress and has been reintroduced in the Sixty-fourth Congress. This bill would "provide Federal aid to cooperate with the various States in the maintenance and support of vocational schools of agriculture, home economics, and the trades and industries for persons 14 years of age and over, and in the maintenance and support of schools for training teachers for the vocational subjects in these vocational schools. This would provide vocational education in regular day schools of high school grade and part-time day schools for youths not employed, and in continuation courses in evening schools for youths and adults regularly employed." The following table presents a summary of the proposed grants to be given to the States by the Smith-Hughes Bill:

Year	Toward salaries for agricultural teachers	Toward salaries for trade and industrial teachers	For training of teachers for vocational work	Federal Board of Vocational Education for administration, investigation, studies, etc.	Total for each year
1915-16.....	\$500,000	\$500,000	\$500,000	\$200,000	\$1,700,000
1916-17.....	750,000	750,000	700,000	200,000	2,400,000
1917-18.....	1,000,000	1,000,000	900,000	200,000	3,100,000
1918-19.....	1,250,000	1,250,000	1,000,000	300,000	3,700,000
1919-20.....	1,500,000	1,500,000	1,000,000	200,000	4,200,000
1920-21.....	1,750,000	1,750,000	1,000,000	200,000	4,700,000
1921-22.....	2,000,000	2,000,000	1,000,000	200,000	5,200,000
1922-23.....	2,500,000	2,500,000	1,000,000	200,000	6,200,000
1923-24.....	3,000,000	3,000,000	1,000,000	200,000	7,200,000

The maximum in each case above is continued annually after 1923-24.

EDUCATION, VOCATIONAL. See EDUCATION IN THE UNITED STATES, section *Vocational Education*.

EDWARDES, GEORGE. English theatrical manager, died Aug. 4, 1915. He was born in 1852. In his early years he intended to enter the army, but his associations with the theatre provided the stronger attraction, and he went into the theatrical business. For 10 years, beginning with 1875, he worked under the direction of D'Oyley Carte, then manager of the Savoy Theatre. He then bought out a half interest in the Gaiety Theatre, which soon passed under

his sole control. This theatre was given over to the lighter comedies and burlesques. With the production of *The Gaiety Girl* Mr. Edwardes first introduced that form of entertainment now known as musical comedy. This was followed by a long series of comedies of a like kind, including *The Shop Girl*, *The Artist's Model*, *San Toy*, *The Country Girl*, and *The Geisha*. These musical plays were produced in conjunction with Charles Frohman, and other partners, and were successful in the United States and England. Mr. Edwardes was one of the most widely known managers in England at the time of his death.

EGGS. See AGRICULTURE, sections *The War and Agriculture* and *Eggs*.

EGYPT. A khedivate of northeastern Africa, virtually under the control of Great Britain and nominally under Turkish suzerainty until 1914, when it became a British protectorate. Cairo is the capital.

AREA AND POPULATION. The area, exclusive of the Sudan, is given as 363,181 square miles, of which only 12,013 square miles are settled and under cultivation. The population in 1907 numbered 11,189,978, not including nomadic Bedouins, estimated to number over 97,000. By nationalities the population was made up as follows: 10,903,877 (10,366,046 sedentary, 537,631 nomadic) Egyptians, and 286,381 foreigners, of whom 69,725 Turks, 62,973 Greeks, 34,926 Italians, 20,853 British including Maltese, 14,591 French including Tunisians, 7704 Austrians and Hungarians, 2410 Russians, etc. Mohammedans numbered 10,366,826; Copts, 706,322; Jews, 38,635. In 1907 Cairo had 654,476 inhabitants; Alexandria, 332,246; Tanta, 54,437; Port Said, 49,884; Mehala el Kobra, 47,955; Mansura, 40,279; Assiut, 39,442; Damanhur, 38,752; Fayum, 37,320; Zagazig, 34,999; Damiatta, 29,354; Minieh, 27,221; Sherbin, 25,473;

Akhmim, 23,795; Beni-Suef, 23,357; Menuf, 22,316; Shebin el Kom, 21,576; Mellawi, 20,249; Qena, 20,069.

EDUCATION. In 1910 an important and very interesting experiment was begun, viz., the handing over of local education to the recently constituted provincial councils. This new departure introduced a much-needed elasticity and diversity into the system. The provincial councils became entirely responsible for elementary vernacular education in their districts, and all schools maintained by them are inspected by the ministry of education. The ministry still retains, under its direct control, certain elementary schools belonging to trusts controlled by

the ministry of Waqfs (pious foundations); these schools, or maktabas, numbered 142 at the end of 1913, with an attendance of 14,027. Higher primary schools, 34, with 7610 pupils; provincial council maktabas, 911, with 57,175; private maktabas (grant-in-aid), 3394, with 174,282; provincial council higher primary schools, 78, with 10,493. Total number of establishments under direct management of the ministry of education, 198, with 27,864 pupils; total number of establishments under inspection by the ministry, 4493, with 253,295 pupils. Of the latter total, 227,434 were boys, and 25,861 were girls. A free primary school has been established in Cairo.

AGRICULTURE. The area planted to cotton in 1910 was stated at 1,642,610 feddans, and in 1911 at 1,711,228—an increase of 68,618 feddans. Production, in 1911, of cleaned cotton, 3,318,529 metric quintals. In the table below are shown areas under main crops in feddans (1 feddan = 1.038 acres) in 1913, as distributed in Lower Egypt, Upper Egypt, and the Suez governorate; with the total area for Egypt, and the total yield (cotton and sugar in kantars, other crops in ardebs of 5.44 bushels):

	Lower	Upper	S.G.	Total	Yield
Cotton	1,339,565	383,485	44	1,723,094	7,554,000
Wheat	678,747	626,634	197	1,305,578	6,972,000
Barley	165,785	203,300	73	369,158	2,078,000
Rice	229,149	13,218	...	242,367	1,280,000
Corn	1,173,716	458,471	369	1,632,556	10,350,000
Millet	...	220,204	...	220,204	1,863,000
Sugar	2,199	46,241	28	48,468	21,629,000

Of the 1,723,094 feddans reported as planted to cotton in 1913, 486,600 feddans were attacked by the cotton worm, as compared with 980,300 in 1912. Area reported as planted to cotton in 1914, 737,354 hectares; yield, 3,144,960 metric quintals. Lower Egypt suffered from pink bollworm attacks, but Upper Egypt yielded a good crop.

The area under sugar cane in 1915 was 21,921 hectares, or 108.2 per cent of the area in 1914, which amounted to 20,252 hectares and gave a production of 9,248,429 metric quintals of cane. The amount of sugar cane treated in 1913 was 741,000 tons, as compared with 537,000 in 1912. Amount of sugar cane treated in 1909-10, 515,839 tons (sugar yield, 553,346 metric quintals); 472,344 in 1910-11 (493,942).

Area planted to wheat, 1913-14, 526,453 hectares (preliminary figures for 1914-15, 640,118 hectares), yielding 8,935,297 metric quintals (10,654,389); barley, 161,035 (187,206) hectares, 2,412,234 (2,993,027) quintals; corn, 713,550 (771,904) hectares, 16,954,119 quintals; rice, 14,967 (133,925) hectares, 598,991 quintals.

Much hardship has resulted from the dearth of cattle for plowing in the Delta, disease having carried off a quarter of a million of these animals in seven years. Increase of cotton pests, due to improper drainage and the wholesale destruction of birds, has wrought havoc. Legislation has been enacted for the protection of bird life, and a commission appointed to devise means for the suppression or better control of the cotton worm and bollworm. The government has taken measures for the distribution of improved cotton seed.

COMMERCE. In the following table are given imports and exports of merchandise in thousands of pounds Egyptian:

	1910	1911	1912	1913	1914
Imports	23,553	27,227	25,908	27,865	21,725
Exports	28,944	28,599	34,574	31,662	24,092

Trade with the principal countries of origin and destination is shown in the following table in thousands of pounds Egyptian (£E = \$4.943):

	1910	1911	1912	1913	1914
Imports:					
United Kingdom	7,311	8,557	7,991	8,496	7,061

* British possessions in the Mediterranean.

† British possessions in the Far East.

‡ Including Algeria.

By decision of the president of the council of ministers, the export of foodstuffs and products (except for necessary supplies to ships leaving, which demand them) was prohibited after Aug. 3, 1915.

The total export of cotton decreased from £E27,529,300 in 1912 to £E25,513,100 in 1913, and from £E24,241,000 in 1910 to £E22,988,000 in 1911, the United Kingdom taking over £E1,000,000 less than in the previous year. In 1913 the United Kingdom took £E10,996,700, as against £E12,572,200 in 1912; the United States, £E2,442,500, as against £E4,072,200 in 1912. Total export of cotton seed was £E3,294,800, of which the United Kingdom took £E1,698,700, and Germany, £E1,480,704. The cigarette export was £E395,000. Coal arrived to the amount of 1,686,700 tons, valued at £E2,010,000, of which the United Kingdom contributed 1,605,000 tons, valued at £E1,909,700.

The withdrawals of leaf tobacco decreased from 8,206,000 kilograms in 1912 to 8,177,000 in 1913. Russian tobacco advanced from 1,027,000 kilograms in 1911 to 1,511,000 in 1912, and 1,853,000 in 1913. Tobacco in bond decreased from 186,000 bales Dec. 31, 1912, to 167,000 bales Dec. 31, 1913, from the fact that, owing to the disturbed political conditions in eastern Europe, merchants transferred their stocks to Alexandria in 1912.

Steamers entered at Alexandria in the 1913 trade, 1932, of 3,718,660 net registered tons; cleared, 1927 steamers, of 3,698,396. There passed through the Suez Canal in 1913, 4979 vessels, of 19,758,040 net tons.

COMMUNICATIONS. There were 1512 miles of state railway in operation Jan. 1, 1913. In addition there were 795 miles of light railways—the Egyptian Delta Light Railways, the Chemins de Fer de la Basse-Egypte, and the Fayum Light Railway. There is an increase of 20 miles, as compared with 1912, due to the completion of a new line from Salhib to Baltim, constructed by the Delta Light Railway Co. Capital value of railways, 1913, £E27,291,943; interest on cap-

ital, 5.97 per cent. Capital expenditure on State railways in 1913 amounted to £E446,000. For 1914, expenditure on capital works, £E443,000 were granted.

FINANCE. The alteration of the date of the financial year involved the preparation of an intercalary budget for the first quarter of 1914, which estimated for a surplus of £E155,000. All unused balances lapsed on March 13, 1914, with the inception of the new system. The budget for 1914-15 was estimated to balance at £E18,162,000. Revenue and expenditure for three years are shown in the table below:

	1911	1912	1913
Revenue ...	£E16,792,750	£E17,515,748	£E17,868,616
Expenditure	14,414,499	15,470,584	15,728,785

The total outstanding debt Jan. 1, 1914, amounted to £E94,202,540, and the annual charge for interest and sinking fund to £E3,551,266.

GOVERNMENT. The reigning Khedive at the date of the establishment of the British protectorate was Abbas (II) Hilmi. By associating himself with the Turkish military operations against Egypt he incurred the resentment of the British government and was superseded by his father's brother, Hussein Kemal Pasha, with the revived title Sultan of Egypt. The Sultan is a man over 60 years of age, experienced in administrative functions, and educated in the Paris of the Second Empire. Sir Arthur Henry McMahon was appointed high commissioner for Egypt.

HISTORY. The first Sultan of Egypt, Hussein Kemal, appointed in December, 1914 (see *YEAR BOOK, 1914, EGYPT*), chose the following ministers to form his first cabinet: Premier and minister of the interior, Hussein Rushdi Pasha; agriculture, Adli Yeghen Pasha; pious foundations, Ismail Sidki Pasha; public works, Ahmed Hilmi Pasha; finance, Yussuf Wahba Pasha; justice, Abdul Khalek Sarwat Pasha. Almost from the outset the newly created Sultan was confronted by foreign and domestic dangers. From without, Egypt was menaced by the ex-Khedive, Abbas Hilmi, who had been given the title "King of Syria and Arabia" by the Sultan of Turkey by way of consolation for the loss of Egypt, and was rumored to be engaged in mustering forces for an attack upon the usurping Hussein Kemal. More serious was the danger from the army which the Turks sent to attack the Suez Canal and invade Egypt. Thanks to the warships stationed in the canal and to the loyal British colonial troops encamped on the banks of the canal, all Turkish assaults were repulsed. (For details see article *WAR OF THE NATIONS, The Suez Canal*.) Within Egypt itself constant conspiracies were being formed against the Sultan's life. Sir Arthur McMahon, the new high commissioner, who arrived in Egypt Jan. 9, 1915, took prompt measures to insure domestic tranquillity; and care was taken to impress the populace with a sufficient display of British colonial troops; but in spite of all precautions, an attempt to assassinate the Sultan almost succeeded April 8. A few months later another attempt was made. A bomb was thrown at Hussein as he passed through the streets of Alexandria on his way to prayers, July 10. After this attack, the government

deemed it necessary to issue a proclamation ordering every person having knowledge of any plot to report it under pain of summary punishment by martial law; nevertheless in September a member of the cabinet was thrice stabbed by an employee of the ministry of finance. The regular November session of the Legislative Assembly and the elections which should have been held in January, 1916, were postponed by a decree of the government, October 27th. See also *ARCHÆOLOGY and WAR OF THE NATIONS*.

EHRLICH, PAUL. German scientist, died Aug. 20, 1915. He was born in Strehlen, in the Province of Silesia, in 1854, and attended school in Breslau, and later studied medicine in that city and at Strassburg, Freiburg, and Leipzig. His first studies were of the cellular elements of the blood, and his experiments in this work fortified him for his practical triumphs over certain blood diseases. About the same time he standardized his diphtheria antitoxin, which was adopted by the German government and which is used almost everywhere to-day. After the publication of this discovery, he took over the direction of a government institution founded at Steglitz, but its activities grew to such an extent that in 1899 the Royal Institute for Experimental Therapeutics was established at Frankfurt-on-the-Main, and Dr. Ehrlich was made its director. Here he carried on many experiments in the treatment of cancer, and in 1912 produced his cancer specific, nigrosin, which he had used on mice with great success. His most important discovery was salvarsan, widely known at first as "606" specific, for the cure of blood diseases. His experiments led him to the discovery of this remedy in 1910. Several years before his death he began experiments on the sleeping sickness. In 1906 Mrs. Georg Speyer endowed an institute for chemical therapeutics for Dr. Ehrlich. This was known as the Georg Speyer House. About the same time John D. Rockefeller learned of the contributions made by Dr. Ehrlich to medical science, and authorized the board of the Rockefeller Institute to place \$10,000 at his disposal. In 1904 he visited the United States, and delivered lectures in several large cities. He received the degree of LL.D. from the University of Chicago. In 1907 he delivered the Harben lectures in London, receiving the degree of Sc.D. from the University of Oxford. He was the greatest exponent of modern pathology. He with Dr. Metchnikoff was, in 1908, the recipient of the Nobel prize for research work in medicine. He was the author of many works on medical science.

ELECTION LAWS. See *ELECTORAL REFORM*.

ELECTION OF SENATORS, DIRECT. See *ELECTORAL REFORM*.

ELECTORAL REFORM. The State Legislatures in session in 1915 enacted many important measures relating to changes in electoral laws of the States. In several States changes were made in the residence qualifications of the voters. In Vermont the voter who changed his residence within 15 days prior to the election might vote in the town to which he moved. The Connecticut Legislature authorized a voter to retain, for the purpose of voting, residence in the town from which he moved. Meanwhile he was regarded as a resident of the town to which he moved, for the purpose of voting there at the following election. A similar provision was passed by the California Legislature. In Colorado, Michigan, Montana,

Washington, Wisconsin, and Iowa, qualified voters, absent from their resident precincts, were permitted to vote elsewhere in the State. In Texas a constitutional amendment was proposed authorizing absentee voting for State officers or on referendum.

REGULATIONS OF ELECTIONS. Separate ballots for judicial candidates in cities of 200,000 or over were required in Illinois and Wyoming. In these States judges had to be nominated regardless of political affiliation on judicial ballots at the general primaries. The Legislature of Indiana passed measures providing for the election by public vote of party committees of all kinds. It further provided that candidates for all offices, except State offices, and for presidential electors, should be chosen by direct primaries, but preferential voting for candidates for President, Vice-President, United States Senator, and Governor was authorized. Provision was made in West Virginia for nomination by direct primaries for all candidates for office, except specified judicial officers, presidential candidates and electors, and officers in small cities. The Legislature of South Dakota repealed the Richards Primary Law enacted in 1913, and restored the law of 1909, with amendments. New direct primary laws were enacted in California and Alabama. In Oregon provision was made for the election of delegates to national conventions, nomination of presidential electors, and for expression of choice of candidates for President and Vice-President. In Minnesota and Wisconsin a second-choice provision of the primary laws was abolished. In Vermont at the primary a provision for referendum was enacted. If the law is approved by the people, it will take effect in 1916; if rejected it will take effect in 1927. In Kansas provision was made for a system of individual declaration of intention to become a candidate as an alternative for nomination by votes. At the time of making this declaration the intended candidate must pay an entry fee of 1 per cent on his salary for the first year. The expenditure of any party for a single campaign is limited to \$15,000.

INITIATIVE, REFERENDUM, AND RECALL. The constitutional amendment authorizing the initiative and referendum was proposed in Minnesota and North Dakota. Frauds in connection with initiative, referendum, or recall petitions were penalized in California, and it was made a felony of 1 to 15 years' imprisonment to subscribe a fictitious name or the name of another person to such petitions. In Nevada provision was made for referendum on local and special legislation to the voters of the county affected. Improvement in the form of initiative bills is provided for in California, which requires the legislative council to cooperate in the passage of such measures on the request of 25 electors, and requires also the Attorney-General to prepare a title and summary for initiative improvements.

PROVISION FOR AMENDMENT OF STATE CONSTITUTIONS. A constitutional convention for the provision of an amendment in New York State was in session in New York (see NEW YORK). The question of calling conventions in Louisiana, New Hampshire, South Dakota, and Tennessee was submitted to the voters. If authorized the New Hampshire Convention will meet in 1918, and the Tennessee Convention in 1916.

ELECTRICAL ENGINEERING. See ELEC-

TRIC POWER, TRANSMISSION OF; ELECTRIC RAILWAYS; RAILWAYS; WIRELESS TELEGRAPHY AND TELEPHONY; etc.

ELECTRICAL INDUSTRIES. The European war continued to have its retarding effect on the development of electrical industries during the first part of 1915, but later on under improved business conditions there was a larger demand in most lines of activity, although not great enough noticeably to alter the financial results as compared with 1914. The accompanying table, compiled by a well-known authority in such matters, giving the gross earnings of the various electrical industries of the United States for 1915, shows a very slight increase—less than one-half of 1 per cent—in the result of operations as compared with the preceding year:

	1914	1915
Electric railways	\$ 780,000,000	\$ 700,000,000
Central stations	400,000,000	425,000,000
Telephone service	850,000,000	850,000,000
Telegraph service	85,000,000	100,000,000
Electrical mfg.	450,000,000	450,000,000
Isolated plants	125,000,000	125,000,000
Miscellaneous	125,000,000	125,000,000
Total	\$2,265,000,000	\$2,275,000,000

The exports of electrical machinery, appliances, instruments, etc., from the United States for the fiscal year ended June 30, 1915, amounted to \$19,771,757, a decrease of \$5,289,087, as compared with the corresponding period of 1914.

The iron and steel industry adopted electric power on an increasing scale and for a great variety of purposes. In steel works the arc furnace was apparently the most favored type, and there was a continually wider use of electricity for welding in railroad and automobile shops, etc. The adoption of electric japanning ovens for use in the automobile industry was making rapid strides and it was estimated that appliances of this sort having a total capacity of 12,000 k. w. were in use in or near the cities of Detroit and Toledo alone, besides an equal amount in widely distributed service stations of the various automobile manufacturing companies.

A project for the construction of a dam near Queenston, at the lower end of the Niagara Gorge, for developing 2,000,000 horse power of electrical energy, was under consideration during the year. A plant at this location, and of such large capacity, would increase enormously the development of the electro-chemical industries in and near the city of Niagara Falls. The importance of the matter alike to the industrial world and to all those interested in the preservation of the scenic beauties of the State of New York, was destined to lead to a bitter controversy.

At the close of the year it was the prevailing opinion that the competition of the jitney automobile that had made such serious inroads on the earnings of electric street railways had about reached its limit, and that owing to the growing recognition of the cost of supplying jitney service on a scale satisfactory to the public, the effect on the earnings of the traction companies would be less severe.

ELECTRIC BATTERIES. There was little change in the design of storage batteries during the year. A modified type of cell was brought out by Thomas A. Edison, Inc., of larger size and

stronger construction than the standard nickel-iron alkaline cell, and adapted for use in central stations and submarine boats. The positive elements consisted of layers of nickel hydrate and metallic nickel flakes packed in small perforated steel tubes. These were clamped into a grid called a subgrid, which was welded into a main grid frame of steel. The negative plates were oxide of iron and mercury packed in flat perforated pockets of nickel-plated steel. The chemical reactions are the same as those in the standard Edison cells in common use.

There was a marked increase in the application of storage batteries to vehicle propulsion not only for pleasure cars but for commercial trucks and fire apparatus as well. The growing recognition by the managers of electric central stations of the value of the electric vehicle as a by-product customer led in large cities to a better system for supplying energy for such purposes, as well as improved arrangements in garages to facilitate the charging, handling, and replacing of batteries.

An endurance test for a delivery wagon battery was made which established a new mileage record for such work, the vehicle traveling 98 miles with a single charge of its battery while operating under regular service conditions, over wet asphalt, carrying its regular load and making the average number of stops, of which there were 35. The amount of current consumed was about 165 ampere hours, or an average of 1.68 ampere hours per mile.

A number of electric locomotives for operation by storage batteries were built during the year, ranging in size from the smallest practicable type, for use in mines and having a height of only 41 inches, to a 10-ton locomotive built for use in the United States Navy Yard at Portsmouth, Va. This was equipped with two 21-horse-power motors, and its battery could develop enough energy to accomplish 800 ton-miles of travel on a level track.

ELECTRIC GENERATORS AND MOTORS.

See DYNAMO-ELECTRIC MACHINERY.

ELECTRICITY. See AGRICULTURE.

ELECTRIC LIGHT AND POWER. See MUNICIPAL OWNERSHIP.

ELECTRIC LIGHTING. The retarded progress of most industries during the earlier part of the year restricted the demand for electric lamps of all kinds, and conservative estimates reported that the total sales of incandescent lamps manufactured in the United States amounted to less than 100,000,000, about the same number as in 1914. Tungsten lamps made up 70 per cent of the total number sold. In 1914 about 1,000,000 gas-filled tungsten incandescent lamps were put on the market, while in 1915 it was reported that more than 1,750,000 lamps of this type were sold in the United States. This lamp was available in a variety of sizes rated from 200 to 1000 watts and adapted to voltages of from 220 to 250. There was an improvement in the efficiency of the 15- and 20-ampere lamps used for series street lighting, and the 1000-candle-power lamp used for this purpose showed a specific consumption of 0.45 watts per candle power. Its quality was further improved by an arrangement for avoiding the damage to the stem caused by the excessive heat of the gas.

Continued efforts were being made in large cities to improve the quality of street illumination. Some illuminating engineers preferred the

flame arc and magnetite arc lamps to the gas-filled tungsten unit, but this was not by any means universal and the substitution of the latter type for arc lamps in several large cities continued on an increasing scale, the prevailing type of the former being of 300 watts' capacity, with a limited number of the 400 watt size. The manufacturers were producing lamps capable of a useful life of about 2000 hours, a notable improvement over the former product.

The high and rapidly increasing cost of platinum during the year made it necessary for manufacturers to find a substitute for this metal to use for the leading-in wires of incandescent lamps. For this purpose an alloy of nickel and chromium was largely employed, and to a limited extent metallic tungsten and molybdenum were used.

In England a novel type of tungsten arc lamp was being developed. The lamp was filled with nitrogen at a pressure of about two-thirds of one atmosphere, and the filament was of tungsten combined with the refractory oxides zirconia, thoria, and yttria. In operation the heating of the filament ionized the gas between it and another electrode, thus leading to the formation of an arc after a few moments. The lamp was so made that the arc occurred between small globules of tungsten, and while still in an experimental stage at the close of the year, gave promise of furnishing a highly efficient light. Its ordinary efficiency was 0.5 watt per candle power, and the color of the light a bright yellow. Higher efficiencies than this were obtained and the color of the light became a dazzling white, but the arc under those circumstances was not as stable as could be desired.

A portable searchlight for fire department use was developed that was giving highly satisfactory results in service. The light was furnished by a 35 volt, 750 watt Mazda lamp of the focus type, for which current was furnished by a 35 volt Edison storage battery of 150 ampere hours' capacity. The focusing device attached to the lamp made it possible either to concentrate the light in a parallel beam of almost 1,000,000 candle power for penetrating dense smoke, or for furnishing a divergent beam to illuminate a wide area such as the entire front of a high building. The apparatus, which weighed only 600 pounds, was mounted on two wheels and could be operated by one man.

The Illuminating Engineering Society, of which Dr. Charles Proteus Steinmetz was elected president in 1915, continued its active work during the year in stimulating and educating the public taste for better quality of illumination, especially as regards its influence on the human eye. The society published in September, 1915, a Code of Lighting for factories, mills, and other work places, embodying a systematic effort to diffuse reliable information on this highly important subject. One of the large accident insurance companies reported as the result of an extended investigation that 25 per cent of all the industrial accidents could be traced in one way or another to improper lighting.

ELECTRIC POWER, TRANSMISSION OF. In the transmission of electric power there was no particularly notable work done in 1915. Existing transmission lines were extended as the demand for energy increased and became diversified. The maximum voltage, 150,000, that had been employed on several such lines in 1914, was not

ELECTRIC LOCOMOTIVES

LOCOMOTIVE FOR CHICAGO, MILWAUKEE AND ST. PAUL RAILWAY

The first electrification for through traffic on a trunk line. Designed and built by General Electric Co. Operates at 3,000 volts direct current

exceeded. Experience with the steel towers commonly used disclosed the fact that in several instances they were unable to resist the twisting action set up by high winds when heavily coated with ice and sleet, thus causing destruction of property and interruption of service.

The Great Falls Power Company of Montana completed a plant of 60,000 horse power capacity on the Missouri River at the site from which the company derives its name. Late in the year this plant began to supply electric energy at 100,000 volts, over a line 140 miles long, to the Chicago, Milwaukee & St. Paul Railway for the electric locomotives on that portion of its line (about 230 miles in length) between Deer Lodge and Harlowton, that had been equipped for such operation. (See **ELECTRIC RAILWAYS.**)

An interesting hydro-electric plant was put in operation during the year in Japan, noteworthy for the large amount of power developed and because it distributed energy at the highest tension of any transmission line in the world outside of the United States and Canada. This plant utilized the power of the Nippashi River, the outlet of Lake Inawashiro. Sixty thousand horse power developed at this location by a fall of 350 feet was being transmitted over two three-phase circuits at 115,000 volts, a distance of 145 miles to the city of Tokyo. The apparatus was supplied by manufacturers in England, Germany, and the United States. In Toledo, Ohio, an underground cable adapted to the unusually high voltage of 23,000 was put in use during the year. Hitherto, the maximum voltage for underground cables had been 13,200. The municipality of Treves, Prussia, was distributing electric energy throughout the city by underground cable at 25,000 volts, a more notable achievement even than that just mentioned. Before this cable was put in use it was tested for a half hour at 75,000 volts with three-phase alternating current and showed only 250 watts per kilometer dielectric loss.

ELECTRIC RAILWAYS. Several important developments in the application of electric motive power to railways marked the year 1915. At the beginning of the year more than 2250 miles of steam railway tracks in the United States had been converted to electrical operation, using either third-rail or overhead conductor. In addition to motor cars in use on those lines there were more than 280 electric locomotives in regular service. During December the Chicago, Milwaukee, and St. Paul Railway was making tests of new electric locomotives built for its 440 mile electrification in Montana and Idaho. These locomotives were the largest and most powerful electric engines ever built, weighing 282 tons, and were for operation at the highest voltage (3000) ever attempted with direct current. As shown in the illustration, they were of the double unit type, each half having the 4-4-4 wheel arrangement consisting of a four-wheel guiding truck and two four-wheel motor trucks with a 375-horse-power motor geared to each axle, giving a total rating of 3000 horse power for the double unit. Their one hour rating was 3440 horse power, giving a tractive effort of 85,000 pounds, while for starting, almost 135,000 pounds could be depended on. On a test run two of these locomotives hauled a train of 48 loaded cars, weighing 3000 tons, up a 2 per cent grade at a speed of 16 miles an hour. This train was followed up the grade by another com-

posed of 37 cars weighing 2000 tons, and pulled by two standard steam locomotives assisted by a Mallet engine as a pusher. This train went up the grade referred to at a speed of 9 miles an hour. The St. Paul engines were also notable for being the first direct-current locomotives ever built to use "regenerative" control, an arrangement for so connecting the motors when descending grades as to act as generators and return current to the line, thus retarding the train.

Early in the year the Norfolk and Western Railway began the operation of a 30-mile stretch of its line in West Virginia with electric locomotives, illustrated in the 1914 YEAB BOOK. These machines operated with alternating current from an overhead conductor at 11,000 volts, and were hauling in regular service trains having a total weight of 3250 tons. One of the important features of the polyphase motors used on these locomotives was their equipment also for regenerative braking but differing from that above mentioned on account of the use of alternating current. Another important electrification was that inaugurated by the Pennsylvania Railroad in September, between Broad Street Station, Philadelphia, and Paoli, Pa., about 20 miles distant. No electric locomotives were used, but 93 motor passenger coaches were employed, equipped with series-repulsion motors of 450 horse power, taking energy from an overhead conductor at 11,000 volts alternating current. This installation, in the opinion of the railway officials, increased the total capacity of Broad Street Station by more than 8 per cent, and the company was contemplating equipping the 12-mile Chestnut Hill branch in the same manner during 1916.

In England, the London and South Western Railway began the electrification of nearly 50 miles of suburban lines near London, using 600-volt direct current with a third rail.

The Swedish State Railways began electric operation of their line from Kiruna to Rikagårsen in October. This attracted considerable attention because it was the first Swedish line to use electricity, and because of its northerly location, which for part of its length was within the Arctic Circle.

ELECTRIC SHIP PROPULSION. See **DYNAMO-ELECTRIC MACHINERY.**

ELECTRIFICATION OF RAILWAYS. See **ELECTRIC RAILWAYS; RAILWAYS.**

ELECTRIFICATION OF RAILWAYS AT CHICAGO. See **SMOKE ABATEMENT.**

ELECTRO-METALLURGY. See **METALLURGY.**

ELEVATORS. A notable work of the year in this field was the completion of a 5,000,000-bushel bulk grain elevator by the municipality of Seattle, Wash. It was built and owned by the city, by which it will be operated. It was designed to afford storage for the local flour mills, and to facilitate commerce, and especially the interchange between rail and ship transportation of the product of the grain fields of Montana, Idaho, and Washington. The new elevator was of concrete, 165 feet high, with a receiving capacity of 95 cars per each 24-hour day, and a shipping capacity of 20,000 bushels per hour. All equipment is electrically operated and access is given to tracks from four railroads, the structure standing between the dock and the tracks. The total cost was \$281,862.

A new method of controlling the elevators or lifts on the London Underground Railway was inaugurated this year. The attendants were stationed at the top and bottom landings instead of inside the cars, on the theory that a man was always available to deal with the inquiries of passengers, and could control the loading of the cars better from the outside than from within. The method consisted of installing control boxes at the various landings which not only served to control the movements of the cars themselves but also to open and close the gates and doors by the action of compressed air. These control boxes were arranged for the electrical control both of the operating gear of the elevators, and the air for the doors and gates. Fifty-one elevators were to be equipped for operation in this manner, and the Central London Railway was also to have the new arrangement installed on the elevators of older pattern.

ELKIN, JOHN PRATT. American jurist, died Oct. 3, 1915. He was born in Indiana Co., Pa., in 1860, and graduated from the Law School of the University of Michigan in 1884. He was admitted to the bar, and began active practice. In 1885 and in 1887 he served in the Pennsylvania House of Representatives; from 1895 to 1899 was Deputy Attorney-General of the State; and in the latter year he was elected Attorney-General. He was Republican candidate for Governor in 1902, and in 1905 was appointed to the Supreme bench of the State. He was at one time chairman of the Republican State Committee, and was a delegate to many Republican National and State conventions.

EMERSON, LUTHER ORLANDO. American composer and hymn writer, died Sept. 29, 1915. He was born in Parsonfield, Me., in 1820, and received an academic education. Studying music, he became teacher and choir master at Salem, Mass., and was afterwards organist and director in the Bulfinch Place Church in Boston. He directed about 300 musical festivals and conventions, and made over 70 selections of church and other music. He also compiled many other books for piano and organ, and composed largely. He composed the music for the song, "We Are Coming, Father Abraham," popular in the days of the Civil War.

EMETIN. See PYORRHCEA ALVEOLARIS.

EMIGRATION. See IMMIGRATION AND EMIGRATION.

EMPLOYERS' ASSOCIATIONS. The first important association of employers in the United States was the Stove Founders' National Defense Association, formed in 1886. It was followed by numerous others before the close of the century. Most of these were formed along trade lines and had for their main purpose the meeting of trade union demands, though they also sought to advance the general interests of the trade. There followed more powerful organizations, including employers as such, regardless of industrial lines. These sprang up in various cities and States under such names as "Citizens' Alliance," "Citizens' Industrial Association," "Employers' Association," and "Manufacturers' Association." The most important of these is the National Association of Manufacturers described below. In 1913 the investigating commission of Congress, created to inquire into such associations on the score of the scandals connecting members of Congress with the legislative activities of the National Association of Manufacturers, secured a

list of more than 200 associations of employers. Such organizations are an inevitable accompaniment of modern industrial conditions and hence are found in England, France, and Germany. Everywhere their purposes are the same. They seek to advance the legislative interests of employers, to secure the advantages of coöperation and combination, and especially to oppose the political and industrial activities of organized labor. Thus they have in all these countries made use of lockouts, black lists, employment bureaus with registers of workmen, professional strike breakers, strike funds, "fake" unions, detective agencies, armed guards, and spies. On the other hand, there has been an increasing tendency on the part of employers to recognize unions, to enter into collective agreements, and to provide suitable machinery for the settlement of grievances and trade disputes. Only a few notable associations can be described here.

THE NATIONAL ASSOCIATION OF MANUFACTURERS began in 1895 as a voluntary association, but 10 years later was chartered as a membership corporation under the laws of New York. Its membership includes individuals, partnerships, and corporations in all kinds of manufacturing businesses. In 1915 it had about 4000 members with combined capital of \$10,000,000,000 and employing about 5,000,000 workers. It thus claimed to be "the largest and strongest trade organization in the world, whether one considers capital invested, hands employed, or output." It has a foreign trade department for studying opportunities in international commerce; a legal department for supplying advice to members on State and corporation law; and a foreign and domestic collection department. It has also a Committee on Industrial Betterment for studying plans for improving the conditions of labor. During the summer of 1915 this committee made a report on the minimum wage at home and abroad. In the view of the committee the weight of the argument was against the advisability of establishing a legal minimum wage. It held that "the general operation of the legislative minimum wage has everywhere been unsatisfactory to employers and employees." Competent students, in commenting on this report, universally condemned it as warped in spirit and as setting forth general opinions unsupported by facts. The annual membership dues of the association are \$50. As it can conduct no business ventures, it has formed an auxiliary corporation, the National Manufacturers' Company, which publishes two export journals and the official magazine, *American Industries*. Its headquarters are at 30 Church Street, New York City.

THE NATIONAL COUNCIL FOR INDUSTRIAL DEFENSE was formed in 1907 through the initiative of President Van Cleave of the National Association of Manufacturers. The primary object was to focus the power of numerous associated employers in opposing legislation deemed "unwise," "vicious class legislation," and to promote legislation deemed "wise." The Council virtually consists of a chairman, treasurer, and counsel, these being, respectively, two chief officers of the N. A. M., and Mr. James A. Emery as counsel. The constituent organizations contribute as they see fit to the necessary expenses, there being no fixed membership fee, but each grants the counsel full power of attorney to represent them in State and national legislative contests.

THE AMERICAN ANTI-BOYCOTT ASSOCIATION

likewise owes its existence to the National Association of Manufacturers. It was formed to fight organized labor in the courts, and especially to put an end to the use of the boycott. It had a prominent part in two famous cases, the Buck's Stove and Range Company case, and the Danbury Hatters' case. See *BOYCOTT*.

THE NATIONAL METAL TRADES ASSOCIATION includes numerous powerful employers in all branches of the metal industries and machine trades. It has branches in some 15 or 16 cities where these trades are important, each branch exercising considerable local autonomy. It has been a most determined opponent of any "dictatorial" action by organized labor, and especially of the closed shop; and while it is not as a whole opposed to the union shop with collective bargaining, some of its stronger branches have successfully opposed every form of recognition of organized workers. It holds the following principles as essential to the conduct of the business of its members and hence cannot be made subjects of arbitration: the number of apprentices, helpers, and handy men must be determined by employers; wages must be fixed by employers; any employee may leave when he sees fit, or the employer at his discretion may discharge any employee. This association has made a most effective use of registers of workers by means of the employment offices maintained in connection with local branches. The records of employees of all member concerns are kept; men cannot transfer from one firm to another without a suitable card from this employment office; the same is true to a large extent of men from other cities who have previously worked in the metal trades. The national headquarters are in the People's Gas Building, Chicago, Ill.

COMMISSION ON INDUSTRIAL RELATIONS. The preliminary report of this Commission (q.v.) included a statement of 21 criticisms of employers' associations. Most of these had been advanced by trade unionists, who favored the formation of such associations as essential to effective collective agreements, but who objected to various methods and policies of many associations. It was objected that they frequently oppose the organization of the workers; to this employers replied that they do not object to unions formed on proper lines, but that they do object to unions which interfere with the employer's right to conduct his business in his own manner and with the right of the worker to determine what conditions of employment he individually is willing to accept. It was objected that the salaried secretaries or managers of employers' associations are usually not employers, lack contact with industry, and to keep their jobs stir up enmity; this was declared by employers to be in the main untrue. To the charge that the associations are usually dominated by small cliques, it was replied that this was simply such centralization of power as experience had shown to be effective. The charge that the associations were indifferent to the condition of workmen was generally admitted on the ground that the associations were formed for purely business reasons and left individual employers free to do what each saw fit in the way of welfare work. The charge that office records of workmen were used to blacklist agitators and unionists was admitted, but it was contended that men ought to be employed on the basis of their past records, and that the elimination of the agitator was in the interest of in-

dustrial peace. That associations opposed to trade unions have boycotted employers using union labor and goods bearing union labels was answered by the contention that such action was taken as defense against union aggression. It was charged that associations, by employing armed guards, maintain a state of feudalism, and oppose the constituted authorities of the State, while these guards themselves provoke violence; to this employers answered that the employment of guards was due to a failure of the government to perform its duties, that, since this involved heavy expense, it was a result, not a cause, of violence, and that since violence was most detrimental to employers' property and faithful workers, it is inconceivable that employers would encourage violence. To the objection that the associations maintain spies and detectives to spy on unions, harass union officials, and foment strikes, it was replied that detectives were used to secure only such information as the employers need, and that it is not probable that employers stir up trouble among their workers only to suffer the consequent losses.

That employers' associations maintain bodies of strikebreakers, who are not bona fide workmen but only mercenaries in the industrial war was defended on the ground that plants must be kept in operation and that the maintenance of a supply of reserves is only an example of business foresight. To the charge that the associations defend members in case of strikes without determining the justice of the issues, the employers replied that this was not frequent and that behind an apparently just strike may be fundamental principles which the employers must maintain. The employers contended that no association exercised such control over its members as to compel them to so distribute advertising that the press could be brought under control. They also contended that the influence of employers over judges through social contact was not greater than the influence of labor through elections of judges. To the charge that the agents of associations bribe union officials, it was answered that such bribes were usually solicited and that no association would be warranted in disciplining a member "held up" by a trade union official. The employers admitted that the associations maintain lobbyists at State and National capitals, but this involved great expense and would not be done had experience not shown it to be a necessary protection against foolish and burdensome legislation. Other minor objections were made and similarly answered.

In its *Final Report*, the Commission included a section on "Organization, Methods, and Policies of Employers' Associations." It found that such bodies had increased rapidly in number and power during the past 10 years, and that they were of two classes, "bargaining" associations, formed to make collective agreements, and "hostile associations," formed to oppose trade unions and collective bargaining. Of the latter a fundamental principle is that wages shall be determined solely by the individual employer and individual worker. Such associations see to it that the number of union men in the shops of members is kept within suitable limits; they nearly all maintain employment agencies and secret-service departments. The report, which was written by Basil M. Manly,

condemned the "hostile" associations as anti-social and recommended the formation of strong associations for the determination in a democratic and equitable manner through collective agreements of the conditions of labor.

ENDANGER. See **PYORRHOEA ALVEOLARIS.**
ENGINEERING. The year 1915 was somewhat abnormal in practically all branches of engineering, when the world at large is considered. The attention of engineers in the leading European countries was turned to the great war and military engineering was paramount to all other considerations. The services of all departments of engineering were enlisted by the great armies, and never before had warfare involved such destructive means and such scientific methods. Not only were these concerned with the actual combat, as discussed under **MILITARY PROGRESS** and **NAVAL PROGRESS**, but also with the supply of the various munitions, including ordnance supplies to battleships, improved shoes, metal helmets, clothing, and other articles manufactured specially. These scientific methods applied also to the operation of railways and waterways under purely military conditions or under conditions changed by military necessities. In the neutral or non-belligerent countries the manufacture of war munitions enlisted the attention of many large manufacturers, and in the United States particularly, new plants came into being for the manufacture of explosives, shrapnel, motor vehicles, aeroplanes, and other munitions of war, where the latest methods of machine operation and factory organization were applied.

As is usual in the **YEAR BOOK**, the more important branches of engineering will be found discussed under their individual heads. See, for instance, in civil engineering, the following articles: **AQUEDUCT**; **BRIDGES**; **BUILDING OPERATIONS**; **CANALS**; **DAMS**; **FLOOD PREVENTION**; **RAILWAYS**; **TUNNELS**; **WATER PURIFICATION**; and **WATER WORKS**. The **PANAMA CANAL**, with its record of successful operation for a few months, till the great slides caused its closure, is also discussed in a separate article, while the much needed harbor improvement at various American ports is considered under **DOCKS AND HARBORS**. The article on **RAILWAYS** in 1915 is particularly interesting, in view of the depression under which the great transportation companies had been operating for several years, and of the improvement of the railway business with a renewal of prosperity. **MUNICIPAL GOVERNMENT**, as usual, requires careful consideration, and this it receives from the **YEAR BOOK**, with a discussion of such problems as **WATER SUPPLY**, mentioned above, **GARBAGE AND REFUSE DISPOSAL**, and forms of municipal engineering and activity, such as **FIRE PROTECTION**, where improved methods of engineering not confined merely to apparatus but extended to proper construction and inspection, were made evident.

In **Electrical Engineering** the year 1915 saw the first long distance electrification of a trunk line—the Chicago, Milwaukee, and St. Paul, in its Rocky Mountain section, through Montana and Idaho. This involved special equipment and locomotives, which are discussed under **ELECTRIC RAILWAYS**. In **DYNAMO-ELECTRIC MACHINERY** the most notable progress of the year was not, as hitherto, an increase in the

size of the various units put under construction or completed, but the large number of units of unusual size and capacity which seemed to be considered the best practice. In **Communication** the most notable advance was in wireless telephony, where successful conversation was maintained between Washington and Honolulu, and signals from San Francisco were heard at Paris. This is discussed under **WIRELESS TELEGRAPHY AND TELEPHONY**. Under **TELEPHONY** the completion of successful transcontinental communication by wire on a commercial basis was the notable event of the year.

In **Mechanical Engineering** the depression that was felt until well into the year acted against any extensive developments, though some progress was to be noted in **INTERNAL COMBUSTION ENGINES**, and larger **BOILERS** with higher steam pressures and higher superheat were considered the coming practice. Under **AERONAUTICS** great developments in size, power, and strength of aeroplanes, as demanded by war conditions, were the order of the year, and great triplanes spreading a hundred feet were reported at its close.

The record of the **SUBMARINES**, while not particularly creditable on the moral side, from the engineering point of view indicated progress, as the increased radius of activity of these vessels indicated good construction and design.

In **SHIPBUILDING** the renaissance of construction in the United States due to war conditions was not accompanied by any original or novel features of design, but naval engineers were interested in the performance of the warships of belligerent navies, and the new battleships that were being designed, built, and placed in service.

In short, the year's record as outlined under the topics given above, and under similar titles, is one that must be considered in the light of the war, and not as marking any great development in theoretical engineering or actual design and construction.

ENGINEERING CONGRESS. See **INTERNATIONAL ENGINEERING CONGRESS.**

ENGLAND. See **GREAT BRITAIN.**

ENGLAND, CHURCH OF. During 1915 all church questions were necessarily considered in their relation to the great war. The work of the army chaplains was efficient, but their number was too small. Dr. L. H. Gwynne, Bishop Suffragan of the Sudan, was put in general charge of army work. Dr. A. F. Winnington-Ingram, Bishop of London, was actively engaged in ministrations in France and Belgium, and paid many visits to the soldiers in the trenches.

The three outstanding features of interest during the year were: Welsh Disestablishment; the opinion of the Central Consultative Body of the Church of England on the Kikuyu Conference; and the question of revision of the Prayer Book.

With regard to the first, it was found that the Welsh disestablishing law, strictly construed, permitted its being put into force immediately in certain parts of Wales, though not intended to be generally operative until the close of the war.

With regard to the Kikuyu Conference, the action of the bishops, and also the scheme of federation there proposed, were referred by the Archbishop of Canterbury to the Central Consultative Body of the Church of England, which published in 1915 the following opinion: "The Central Consultative Body heartily appreciate

the fact that the main object of the Kikuyu Conference—namely, the promotion of a brotherly spirit and the adoption of practical steps toward unity—is wholly desirable. All this, with the mutual consideration involved, and with the united testimony borne to the faith which is enshrined in the Apostles' and Nicene Creeds, plainly makes for unity; and it is by such methods and by such a temper, more, perhaps, than by formal organization, that the conditions may be realized in which the end of our efforts and our prayers—a genuine African Church—will be shaped by the Holy Spirit of God according to His will." This opinion was endorsed by the Archbishop, who, nevertheless, emphasized the difficulty and danger of allowing one section of a great communion to federate itself with some of those outside of it. He admitted that interdenominational preaching might be allowed, if care were taken not to contravene the authority of the diocesan bishop. He also favored a large discretion for the diocesan bishop in regard to admitting unconfirmed persons to the Holy Communion. With regard to the special eucharistic service held at Kikuyu, at which such persons were admitted, the Archbishop advised abstention at present from such services.

A joint committee of the two houses of the Canterbury Convocation recommended a number of changes in the Prayer Book. These include a rearrangement of the Psalter, a revision of the calendar, and alterations in the ornaments rubric, the daily offices, and the litany.

In 1915 there were in England and Wales approximately 2,446,000 Anglican communicants and 2,541,000 Sunday school scholars. There were 14,019 beneficed clergymen, 222,309 Sunday school teachers, and about 7700 assistant curates. The annual income from voluntary offerings is between £12,000,000 and £14,000,000.

ENTOMOLOGY. As has been stated in earlier YEAR BOOKS, economic entomology is a subject of especial interest in the United States where insect pests (other than those carrying disease) are undoubtedly of more pressing importance than anywhere else. A large number of these pests are imported, but some are undoubtedly indigenous. Writing from an ecological standpoint, Shelford considered the latter condition an indirect result of the removal of forests. He thought that the original habitat of these insects was in "cracks" in the original forest; i.e. along the margins of streams and ponds, and on rocky highlands where trees do not grow. As the forests were removed, the insects spread from these "cracks" over larger areas.

The gypsy moth has continued to spread over New England, accompanied in many cases by the brown tail. Twenty towns in Connecticut report the presence of the gypsy, and 72 the brown tail. In this State the last Legislature appropriated \$25,000 to be expended in the next two years in combating these insects. The gypsy moth problem is discussed in *Bulletins* of the United States Department of Agriculture, the general conclusion being that in many cases we must resort to reforestation with trees on which the animal does not feed, if we are to have any forests left. For apples, spraying with arsenate of lead and thorough removal of all probable nesting places in the immediate neighborhood are recommended. In Europe, Burgess reported that coniferous trees are not attacked, but that

other trees are subject to periodical attacks. In Massachusetts, a number of parasites have become acclimated; two of these are hymenopterous parasites, and one is a fly, while the Colosoma beetle is doing effective work in feeding on caterpillars of both the gypsy and brown tails. Egg clusters have been found on quarry products, and in October, 1914, a quarantine was declared against these, similar to the one earlier placed against lumber products. Quarry products must now be inspected exactly as are the others.

Much work was done during the year on the house fly problem. Experiments conducted in Texas indicated that in order to prevent reproduction it is necessary to capture the female flies within 4 days after they emerge in summer, and within 10 days in early fall and spring. The egg stage lasts less than 24 hours even in winter, while the larval stage varies from 3½ days to about 3 weeks. While horse manure is their favorite breeding material, they will breed in almost any decaying materials such as ensilage, bottoms of burned straw stacks, etc. Flies will feed on manure, but in these experiments, did not lay eggs when this was the only food. These experiments in Texas indicated that the fly, with plenty of food, will live to an age of 53 days, but no evidence was seen that they can hibernate as adults. It seemed demonstrated that hibernation is always as eggs or pupæ. Hewitt, however, in other localities, thought he found them hibernating in the adult condition.

According to a *Bulletin* of the United States Department of Agriculture, the compound *Para-dichlorobenzole*, used in the proportion of 1 pound to every 100 cubic feet of space, is superior to carbon bisulfid in killing insects. It is not injurious to human beings unless taken internally.

That the public is becoming aware of the seriousness of the fly problem is evidenced by the number of publications that appeared during the year, both from the government printing office, and from private sources. The best mode of prevention is undoubtedly to eliminate breeding places, but this is not always practicable, and attempts have been made to discover some effective larvicide. A publication of the United States Department of Agriculture recommended the use of hellebore, ½ pound dissolved in 10 gallons of water for each 8 bushels of horse manure, as an efficient larvicide, and one that does not affect the value of the manure. For outhouses, etc., they recommended the use of powdered borax in the proportion of 62 pounds to 8 bushels of manure. If used in larger quantity, the borax is liable to injure the material for fertilizing purposes, by killing vegetation with which it comes in contact.

Since 1912 the mosquito work in the State of New Jersey has cost \$200,000, while the property values within the protected area have increased more than \$5,500,000.

Unusually successful results from the importation of parasites of injurious insects are reported from Hawaii, where, according to Howard, more has been done along this line than anywhere else in the world.

Much trouble was experienced in California from the insects which infest dried fruit. Of these the "Indian Meal" moth, the fig moth, and a number of beetles are most important. It was estimated that a single "Indian Meal" moth

will give rise to 23,000 larvæ in the course of a summer. Infestation may take place at any stage of the preparation of the fruit, though heating and the sulphur treatment which are used in the "processing" tend to kill the insects. The fruit may also become infested after it is packed, and hence it is desirable that some method of sealing the packing boxes should be devised.

In the *Australian Zoölogist* is recorded the appearance in Australia of a carpet beetle (*Attagenus piceus*) imported in cloth from London, and a West Indian longicorn beetle (*Eburia binodosa*) was seen to work its way out of an imported oak chair. The observations were interesting as showing possible means of transportation of insects. It was feared that the carpet beetle might develop into a serious pest.

An alarming discovery recently made in Arizona is that there is a variety of the cotton boll weevil feeding on cotton-like plants. In Texas some parts of the State have been free from the weevil because of the dry climate. If this newly discovered form can live in the dry climate of Arizona there is reason to fear that it may spread to Texas and attack the cultivated cotton there. It is now found only on the wild plant, but might change its food habit at any time. See also INSECTS, PROPAGATION OF DISEASE BY.

EPILEPSY. Reed returns to the old theory that epilepsy is due to a toxic state of the system, originating in the intestinal canal, either as a result of chemical changes in the food after ingestion, or in consequence of bacterial fermentation, or both. Looking for the causes of this intestinal toxemia, he found that obstinate constipation was a common phenomenon in epilepsy, and this was of a mechanical nature, due to displacements, malformations, adhesions, angulations, etc., of the intestines. The whole question resolves itself into providing adequate intestinal drainage and his surgical experiences have confirmed these theories to a remarkable extent. Besides correcting malpositions, releasing adhesive bands, and the like, Reed's main procedures have been colectomy and short-circuiting the large bowel, the same procedures that are used by Sir Arbuthnot Lane and his followers for the cure of intestinal stasis. Reed reported that in his cases constipation was promptly overcome and as a rule the epileptic seizures disappeared immediately. In other cases, attacks of the *grand mal* type assumed the light character of *petit mal*. The question naturally arises, why do not other individuals with precisely the same pathological lesions as those which he found in epileptics suffer from epilepsy? Reed answers by asserting his belief that the infection is specific and probably due to a gas-forming bacillus. He was unable to find any case of so-called traumatic epilepsy, assigned to some injury of the head; on the contrary, he found where a history of traumatism existed, the injury manifested itself in the intestine; that is, there was evidence in the way of prolapse of this structure or of other abdominal organs.

EPWORTH LEAGUE. See articles on Methodist denominations.

ERIE FLOOD. See FLOOD PREVENTION.

ERITREA. An Italian colony on the west shore of the Red Sea. Estimated area, 45,800 square miles; population, 279,000. Asmara is

the capital. Salt is an important product, being sent to Southern Abyssinia, where it is a monetary currency. Imports, 1912, 18,845,118 lire; 1910, 16,372,830 lire; 1909, 17,225,720. Exports, 1912, 9,371,802 lire; 1910, 7,277,865; 1909, 6,845,026; transit, 1912, 5,234,262; 1910, 3,857,351; 1909, 3,152,380. Tonnage entered, 1912, 178,152; 1911, 191,101; 1910, 164,696. There are 74 miles of railway. The railway from Massaua to Asmara was finished in 1911; it will be extended to Keren and Agordat. Estimated revenue (1910-11), 8,977,750 lire (state contribution, 6,350,000); expenditure, 7,223,700 (military administration, 3,988,200). The 1912-13 budget balanced at 13,008,004 lire. Local revenue (1913-14) was estimated at 3,221,000 lire.

EUGENICS. Not the least of the effects of the great war has been the interest aroused by it in the question whether, because of the conflict, the human race is or is not deteriorating in those qualities which are handed down from generation to generation, not by means of training but by inheritance. During the early part of 1915 the English people were much disturbed by the so-called problem of "war babies." Not only was moral deterioration feared from an anticipated increase in illegitimate births, but the question was also raised whether the coming generation would not be disadvantageously affected. The problem early assumed large proportions in the press, but evidence later collected showed that matters were greatly exaggerated. Attention then turned to the more serious question as to whether the sudden removal of a large proportion of potential fathers from their homes—a British army of 3,000,000, for example, requiring every second man between the ages of 18 and 45—would not greatly affect the eugenic qualities of the future population by leaving only the more inferior parents to contribute to it. Among many articles on this subject, those of Prof. J. A. Thomson on "Eugenics and the War" (the second Galton Lecture) in *The Eugenics Review*, April, 1915, and of Prof. Roswell H. Johnson, on "Natural Selection in War," in *The Journal of Heredity*, December, 1915, were perhaps the most valuable because of the scientific caution displayed. Both of these writers agreed that the effect of the war would be "dysgenic." In this connection, a recent book by Profs. D. S. and H. G. Jordan, on *War's Aftermath* (Boston, 1914), is interesting. This book is an attempt to gauge the eugenic effects of the Civil War.

During the past year, both in the scientific and in the practical phases of eugenics, many noteworthy advances have been made along usual lines of inquiry. On the scientific side, for example, the Italian Anthropological Society was reported to be making an investigation, on a scale which was expected to definitely settle the question, as to whether first-born children, as has been maintained by the English Biometric school, are usually inferior to others. Much discussion has occurred also concerning pro-

posed modifications of the famous "Binet Test" for mental ability. The practical application of the Binet scale itself has been extending rapidly in public-school systems, in institutions for the feeble-minded, in prisons, and in other institutions. Striking results of its application have sometimes been reached. H. B. Hickman reported, for example, in the *Training School Bulletin*, January, 1915 (vol. xi, No. 9), that out of 229 delinquent and criminal boys tested, only about 63 would be able to leave the institution and take a normal station in society; at least 45 would be unfit for anything but institutional life; and the remainder would always require assistance of some kind to make a living. The same report contained an account of "The First Psychopathic Laboratory in a Prison" (Kansas), by Alexander Johnson. According to Mr. Johnson, during the year ending Aug. 17, 1914, 325 men were examined; 224 white, 101 colored. Of the whites, 33, or about 15 per cent, were found to be normal mentally; of the negroes, about 4 per cent. Seventy-five per cent of the whites and 90 per cent of the negroes were classed as "morons."

While, on the one hand, work of a character which is likely in the end to produce scientific results has thus been accomplished, on the other hand, a considerable amount of hasty legislation has been attempted. In a recent article on the subject, Dr. W. C. Rucker, assistant surgeon general of the United States Public Health Service, Washington, D. C., and secretary of the Committee on Education and Extension of the American Genetic Association, reported that four States were considering sterilization legislation, and that nine contemplated eugenic restrictions on marriage. Dr. Rucker considered none of the proposed laws satisfactory from a eugenic standpoint. An excellent report and criticism of eugenic legislation was recently issued by the University of Washington (*Bulletin* No. 82, Seattle, Wash., May, 1914). The conclusion was therein reached that in many respects a considerable portion of the legislation discussed was so out of date from a biological point of view that it was really worse than useless.

For standard treatment of the subject of eugenics the reader is referred to the list appended to the article EUGENICS in the YEAR BOOK for 1914. From the large number of recent books, reports, and articles, not heretofore cited, the following are selected as particularly worthy of attention: *Defective Children*, by T. N. Kelynak, M.D. (London, 1915); *Geburten-Rückgang und Geburten-Regelung*, by Prof. A. Grotjshu (Berlin, 1914); *Heredity and Environment in the Development of Men*, by E. G. Conklin, professor of biology, Princeton University (Princeton University Press, 1915); *Human Derelicts, A Collection of Medico-Sociological Studies*, by T. N. Kelynak, M.D. (London, 1914); *The Next Generation, A Study in the Physiology of Inheritance*, by F. G. Jewett (New York, 1915); *The Progress of Eugenics*, by Dr. C. W. Saleeby (New York, 1914); *The Truth About War Babies*, by John M. Rehart, honorary secretary National Birth-Rate Commission (London, 1915); *Bulletins of the Eugenics Record Office*: No. 12, "The Feebly Inhibited: Violent Temper and Its Inheritance" (September, 1915); No. 13, "How to Make a Eugenic Family Study" (June, 1915); No. 14, "Hereditary Fragility of Bone"

(November, 1915); *The Training School Bulletin*, especially vol. xii, No. 4, June, 1915, containing "The Examination of 1097 Children in the Public Schools of Cleveland, Ohio," "A Study of 150 Delinquent Boys," "The Relation of Delinquency and Criminality to Mental Deficiency," "The Celibate Woman of To-day," by Earl Barnes (*Popular Science Monthly*, June, 1915); "Education and Race Suicide," by R. J. Sprague (*Journal of Heredity*, April, 1915); "Mental Tests," by C. Burt, in *Child Study* (February, 1915); "Misconceptions of Eugenics," by S. J. Holmes (*Atlantic Monthly*, February, 1915); "Political Aspects of Eugenics," by H. S. Shelton (*Contemporary Review*, January, 1915); "The Scientific Claims of Eugenics," by T. More (*Hibbert Journal*, January, 1915).

EUROPEAN WAR. See **MILITARY PROGRESS**; and **WAR OF THE NATIONS**.

EVANGELICAL ASSOCIATION. A religious denomination principally composed of German-born citizens of the United States. Its doctrines are in many respects similar to those of the Methodists. Its communicants belong to nearly all parts of the northern section of the United States and Canada, and there are also many to be found in the West and South. The missionary work of the Association is carried on chiefly among the Italian immigrants. In 1915 the denomination had 115,243 communicants, 1663 churches, and 1031 ministers. The Church is divided for administrative purposes into 24 districts, has over 175,000 pupils in its Sunday schools, and a Young People's Alliance whose membership numbers over 50,000. A preaching house is maintained in Cleveland, Ohio, and there are several philanthropic institutions and hospitals in Chicago, Philadelphia, and cities throughout the Middle West. Northwestern College, Naperville, Ill., is the leading educational institution.

EXCESS CONDEMNATION. See **CITY PLANNING**.

EXHIBITIONS, ART. See **PAINTING AND SCULPTURE**.

EXPERIMENTAL PSYCHOLOGISTS, ASSOCIATION OF. See **PSYCHOLOGY**.

EXPERIMENT STATIONS. See **AGRICULTURAL EXPERIMENT STATIONS**.

EXPLORATION. (For Arctic and Antarctic exploration see **POLAR RESEARCH**.) During the year 1915 not only have no new and extended schemes of exploration been initiated, but several have been recalled or postponed. Additions along lines of geographical knowledge are largely due to expeditions which were already in the field in 1914. Among these the most important are Shackleton's southern voyage for the purpose of crossing the Continent of Antarctica, from Weddell Sea to McMurdo Sound; the archaeological researches of Stein in the deserts of central Asia; the discovery of new land by Stefansson in Arctic America; and the making of the Northeast Passage from the Pacific Ocean to the White Sea by Vilkitzsky.

AFRICA. When war conditions arose explorations practically ceased in Africa, where, however, the areas of unknown regions are becoming limited. French researches have continued to some extent. The most notable is probably the surveys of Henry Hubert, by journeys of 2500 miles, of the geology of the Ivory Coast. Be-

sides his general geological map of western Africa, this scientist has completed geological maps of colonies in Senegal, Guinea, Dahomey, Upper Senegal, and Niger. Great extensions of railway systems will facilitate future explorations. Notable is the completion of the Trans-African Railroad from Kabolo, on the Congo, to Lake Tanganyika, which already had rail connection with the port of Ujiji.

NORTH AMERICA. (For the explorations of Bernier, McMillan and Stefansson, see *POLAR RESEARCH*. For Alaskan work, see *ALASKA*.) With its strictly limited regions of unknown territory, North America has been comparatively neglected, except in the Dominion of Canada. The most interesting work in that country is the rediscovery in Hudson Bay of the lost islands of Gerritz' chart (1612), discovered by Hudson in his last voyage (1610-11), concerning which there have been much doubt and discussion. R. J. Flaherty has skirted this group, which lies to the north of James Bay, between 55° and 60° north latitude. The largest of the three islands is 100 miles in length, and the area of the group is about 4000 square miles. The most notable discovery in the United States is the Sun Temple, unearthed in the Mesa Grande Park by Dr. J. W. Fewkes. Built as early as 1300, for religious and ceremonial purposes, it is the most striking prehistoric ruin in America. Its 25 rooms are enclosed by walls 4 feet thick and over 1000 feet in length.

SOUTH AMERICA. The Bolivian-Brazilian Boundary Commission has completed its exploration and delimitation of the boundary of the two countries along the Abuma, the Madeira and the Raquirran rivers. Between July and October, 1914, Dr. Farabee explored portions of the valley of the Upper Amazon, giving special attention to the tribes living in the watersheds of the Ucayale and adjacent streams. In March, 1915, he began a journey from the Upper Purus River for the purpose of skirting the unknown frontiers of Brazil, Bolivia, and Peru. Among additions to the geographic literature of 1915 is the astonishing report of Maj. P. H. Fawcett on his explorations of extensive and hitherto unvisited forest areas of Bolivia. He states that in regions distant from the navigable rivers, there are numerous large tribes, aggregating "at least 100,000 savages," who have had no contact with white men. These tribes are for the most part anthropophagus, wage continuous wars, and generally live in communal fashion. Within 15 leagues of the provincial capital of Santa Cruz there are hostile savages yet living under Stone Age conditions. Savage tribes have also barred from travel the Mamore and Heat rivers. Professor Bingham made in 1915 his fifth expedition to South America. His Peruvian researches were pursued in the valleys of the Apurimac and Urubamba rivers. In addition to geographic and archaeological work, large collections were made of new and of ancient food plants.

ASIA. During Dr. Filippi's recent explorations, he discovered that the Remo Glacier, on the crest of the Karakoram Range between Cashmir and Afghanistan, drains both into the interior of Asia and also into the Indian Ocean. It proves to be the source of the Yarkand, an affluent of the Tarim River to the northeast, and of Stryok, the main tributary of the Indus to the southwest. An English-American expedition has made an ethnological exploration of the

valley of the Lower Yenesei, under Miss Czapliska, Oxford University, and Mr. Hall, University of Pennsylvania. Studying first the Samoyeds, the party wintered with the Tungus, a very primitive folk, and subsequently made researches among the Tartars.

Sir Aurel Stein's recent discoveries in East Turkestan have been extensive and important. He began his explorations from Tun-huang, southeast of the Gobi Desert, where he visited the temple of the Thousand Buddhists. Thence he traced for 250 miles, across a sterile desert, an ancient wall of China which was erected at least a century before the beginning of the Christian era. This wall was built with great engineering skill of reed and brushwood fascines, filled with clay or gravel. It was surmounted with watch-towers, etc., and abundant remains were found of the soldiers who occupied it as a defensive force. It appears that the adjacent sterile regions had been made habitable by extensive irrigation systems. Stein explored thoroughly the ruins of Khara Koto, which he identifies with Marco Polo's city of Etzina, the ancient outfitting station of merchants making the 40-day march across the desert to Karakoram, the old capital of Mongolia. Among the ruins were found Buddhist manuscripts and prints, frescoes, stuccos, reliefs, records on paper, coins, ornaments, etc. He also explored the region around Turfan, mapped large areas of the Dry Mountains, and portions of the former bed of the Oxus. Although turned back by the war, the Voisins, Segalen, Lartigue (French) expedition succeeded in reaching as far west as Li-kiang-fou, on the Yangtse in Yunnan, Western China. The Smithsonian expedition for biological research along the Siberian coast, under Koren, obtained a large collection of birds and of Arctic fossils.

EUROPE. Some additions have been made to a knowledge of the Kola Peninsula, by the survey and construction by the Russian government of a railway from Vologda, on the Petrograd-Archangel Railroad, northward to Kola on the Northern Coast, thus affording an ice-free harbor.

OCEANIC. The Coast and Geodetic Survey, continuing its work of offshore exploring, has located the edge of the continental shelf along a large part of the South Atlantic Coast. The 100-fathom curve lies quite far seaward, extending in some instances into the Gulf Stream. The wire-drag operations of the Survey have covered 214 square miles in Alaskan waters and 250 in the Atlantic. Surveys in the Philippines disclose the existence of a submerged range of coral mountains, extending southwesterly for 200 miles from the south end of Panay. The Cagayenes and other small islands are the summits of the coral range. The Sulu Sea is divided into two deep basins, wherein a maximum depth of 18,294 feet was found. Hydrographic surveys of the delta of the Obi resulted in the discovery of a deep channel through which sea-going ships of deep draught can ascend the river, thus opening interior Siberia to sea-traffic. Exploration in the field of terrestrial magnetism has been continued during 1915 under the direction of Dr. Bauer of the Carnegie Magnetic Institute. The Carnegie Institute's work included observations at more than 200 sea-stations, and extended from 60° N. latitude, in Bering Sea, to Port Lyttleton, N. Z., in the Southern Hemisphere.

OPENING OF THE EXPOSITION ON JANUARY 1, 1915

EXPLOSIVES. See CHEMISTRY, INDUSTRIAL, section so entitled.

EXPOSITIONS. During the year two great international expositions have been held in the United States: the Panama-California Exposition in San Diego, Cal., and the Panama-Pacific Exposition in San Francisco, Cal.

PANAMA-CALIFORNIA EXPOSITION. This was held in San Diego, Cal., and the history of its inception and development has been given in the *YEAR BOOKS* for 1911, p. 247; 1912, p. 216; 1913, p. 236, and 1914, p. 235. It was opened on January 1st, with appropriate ceremonies, including an address by the Hon. William G. McAdoo, who represented President Wilson on that occasion. The beauty of the exposition has impressed those who have visited it and its influence in bringing about a greater appreciation of the possibilities of the Spanish Colonial architecture will be its lasting lesson. On December 4th, an official announcement was made that the Panama Exposition, opened on Jan. 1, 1915, would continue throughout 1916 as the Panama-California International Exposition. The 1916 exposition will open on January 1st, the day following the official closing of the 1915 fair. Foreign exhibits valued at several million dollars, from the Panama-Pacific Exposition in San Francisco, just closing, are to be brought to San Diego. Two of the largest exhibits at the San Francisco Exposition—the Canadian and the Italian—have been obtained, and other exhibits promised are the French, Swiss, Spanish, Netherlands, and Russian. See also *ARCHITECTURE*.

PANAMA-PACIFIC EXPOSITION. (See *YEAR BOOKS*, 1912, p. 216; 1913, p. 236; and 1914, p. 236.) This exposition was held in San Francisco, Cal. The touching of a button by President Wilson in the White House gave the electric signal that opened the exposition exactly at noon, Pacific time, on February 20th, which was made a legal holiday throughout California. The exercises included addresses by Hon. Franklin K. Lane, who represented President Wilson, Gov. Hiram W. Johnson, and Charles C. Moore, president of the exposition. The exposition continued until midnight on December 4th, when President Moore closed the festivities by pressing a button that turned off the electric display. The following words are from the message which President Wilson sent to the formal closing exercises:

"The Panama-Pacific International Exposition: which in its conception and successful accomplishment gave striking evidence of the practical genius and artistic taste of America; which in its interesting and unusual exhibits afforded impressive illustration of the development of arts and peace; and which in its motive and object was eloquent of the new spirit which is to unite East and West and make all the world partners in the common enterprises of progress and humanity." Thirty-nine foreign nations and 37 States and 3 Territories of the American Union were represented at the exposition. It was estimated that there were 80,000 exhibitors whose displays were valued at \$350,000,000. The daily attendance, which averaged about 62,000, began with 245,143 on the opening day and reached its highest number—348,472, on November 2nd, San Francisco Day. The total was 18,413,399. There were 800 congresses and conventions held

during the life of the exposition. The financial results of the exposition were most satisfactory. In abbreviated form the data are as follows: cost of exposition to opening, \$18,365,193.69; income to opening, \$16,988,555.79; deficit on opening, \$1,376,637.90; operating surplus of exposition period, \$2,571,807.79; estimated net profit on closing, \$1,195,169.89; estimated net loss of wrecking period, \$160,000; and estimated final net profit, \$1,040,000. In addition to this surplus the exposition has paid for and given to the city the Municipal Auditorium, in the Civic Center, at a cost of \$1,086,000, and the \$50,000 pipe organ now in Festival Hall. In January Congress passed a law permitting the minting of special coins commemorative of the exposition as follows: Three thousand 50-dollar pieces; 10,000 2½-dollar pieces; 25,000 1-dollar pieces, all in gold, and 200,000 half-dollar silver pieces. The law permitted the mint to deliver these coins at their par value, and the exposition was authorized to put its own selling price on the coins. See also *ARCHITECTURE*; and *PAINTING AND SCULPTURE*.

OTHER EXPOSITIONS. Among minor and local expositions held in the United States may be mentioned the First National Exposition of Chemical Industries held in New York City during September 20-25. It is described under *CHEMISTRY, INDUSTRIAL* (q.v.). The expositions held abroad during the year include the British Industries Fair in London, England, during May 10-21; the Canadian National Exhibition in Toronto, Canada, during August 28-Sept. 13; the Swiss Exposition of Toys in Zurich, Switzerland, during October; and a traveling exposition, the proceeds of which were designed for the care of war cripples and invalids under the auspices of the Red Cross Society during the autumn in Berlin, Breslau, Budapest, Magdeburg, and Cassel. In the Orient the second annual exhibition of Siamese agriculture and domestic manufactures was held in Bisanuloke, Siam, during March 17-21; a Chinese National Exposition was opened in Peking on October 10th; an Industrial Competitive Exhibition was held in Seoul, Chosen, during September 10-October 31, and a Japanese Exposition was held in Santiago, Chile, during September.

COMING EXPOSITIONS. The opening of the National Exposition of Panama has again been postponed until Jan. 21, 1916. An International Exposition of Electrical Appliances and also a general Spanish Exposition is announced as in preparation to be held in Barcelona, Spain, during 1917. Announcement is made of the organization of committees for the preparation of a celebration in 1916 of the 250th anniversary of the founding of the city of Newark, N. J., and of the 200th anniversary of the founding of San Antonio, Texas, by the Franciscan monks. See also *ARCHITECTURE*.

FABRE, JEAN HENRI, a distinguished French entomologist, died at Orange, France, on Oct. 11, 1915. He was born at St. Léons, Avignon, in 1823, taught for several years in the Lycée of Avignon, and was afterward professor of physics at the College of Ajaccio. Later he retired to Lérignan, where he wrote his greatest work, *Souvenirs entomologiques* (10 vols. 1879-1907), which was crowned by the Institute. His other works are: *La science élémentaire, a series of lectures* (1862-65); *Histoire de la bûche* (1866); *Notions préliminaires de phy-*

sique (1867-70); *Le Livre d'histoires* (1868); *Les ravageurs* (1870); *Astronomie élémentaire* (1872); *Les auxiliaires* (1873); *Lectures scientifiques: zoologie* (1873); *Botanique* (1874); *Premiers éléments de physique* (1874); *De chimie* (1875); *De science naturelle* (1875); *Les serviteurs* (1875); *La plante* (1875); *L'Industrie* (1875); *Cours complet d'enseignement littéraire et scientifique* (1876); *Livre des champs* (1879); *Les inventeurs et leurs inventions* (1880); *La vie des insectes* (1910). Fabre was made a corresponding member of the Institute and a chevalier of the Legion of Honor. Parts of his writings have been published in English, as *Insect Life* (1901); *The Life and Love of the Insect*, translated by A. T. de Mattos (1911); *Social Life in the Insect World*, translated by Bernard Miall (1913); *The Life of the Spider* and *The Life of the Fly*, translated by A. T. de Mattos (1913).

FAILURES. See FINANCIAL REVIEW, section so entitled.

FALABA CASE. See UNITED STATES AND THE WAR.

FALKLAND ISLANDS. A British colony composed of a group of islands in the South Atlantic. They are East Falkland (3000 square miles), West Falkland (2300), and about 100 smaller islands (totaling about 1200 square miles). South Georgia, a group of islands 54½° S., with an area of about 1000 square miles, a great whaling station, is a dependency of the Falkland Islands. Inclusive of South Georgia the population numbered in 1911, 3275 (2370 males and 905 females). Estimated population Dec. 31, 1913, 3223. Sheep farming is the sole industry of the colony, the entire country being wild moorland fit for little besides pasture. There are no trees. There were in 1913 about 698,000 sheep, 7821 cattle, and 3528 horses. Hides, skins, horns, hoofs, bones, tallow, wool, and guano are the exports. Whale produce exported in 1913 was valued at £1,252,932, of which £443,378 from South Georgia. Imports and exports for 1913 were valued at £239,222 and £1,460,219 respectively (£93,913 and £471,156 in 1911). The United Kingdom contributed imports valued at £152,958, and received exports £750,994. Total tonnage entered and cleared, 500,449 (315,278 in 1911). Revenue, 1913, £42,929 (1911, £35,349); expenditure, £25,238 (£22,460). There is no public debt. The only town is Stanley, with about 950 inhabitants. It has a fine inner and outer harbor and is a coaling station for vessels rounding Cape Horn. Beyond the town limits there are no roads. The islands were taken by Great Britain in 1832 for the protection of the whale fisheries. Dependencies besides South Georgia are the South Shetlands, Graham's Land, the South Orkneys, and the Sandwich group.

FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA. The council officially unites in its activities 30 Protestant denominations, including 139,000 churches with 17,500,000 members. During 1915

the established lines of activity were maintained by the council in State and local federations, foreign missions, home missions, religious education, social service, evangelism, Sunday observance, temperance, and peace and arbitration. The council promoted a religious exhibit and conducted a continuous religious campaign at the Panama-Pacific Exposition, with evangelistic meetings, daily lectures, and conferences. In aid of the promotion of international friendliness through the churches, 400,000 books and pamphlets were distributed and 170,000 letters sent out. A Christian embassy to Japan was well received, and an investigation was conducted on the Pacific Coast concerning the Japanese problem in the United States. Delegates afterward came from Japan for fraternal conference with American workers. A committee on the special interests of the colored denominations was projected. The general secretary, Rev. Charles S. MacFarland, visited Holland, Switzerland, England, France, and Germany, representing the United Churches on 25 national committees; and he addressed over 100 conferences. The council's year ended free of debt, but it was admitted that the growing demands of the work call for much larger expenditure in 1916. The annual meeting of the executive committee of the council was held at Columbus, Ohio, on December 8-10th, was attended by 1150 members and delegates, and was addressed by the President of the United States. The administrative committee is in close and constant communication with the churches of the belligerent nations of Europe, looking toward future opportunities of reconciliation, a delegation being in readiness to go to Europe at the earliest opportunity.

The denominations affiliated with the Federal Council are as follows: Baptist (North), Free Baptist, Christian, Congregational, Disciples of Christ, Evangelical Association, Evangelical Synod, Society of Friends, Lutheran General Synod, Methodist Episcopal Church, Methodist Episcopal Church (South), German Evangelical Synod, National Baptist Convention (colored), the Mennonite Church, the African Methodist Episcopal Church, the African Methodist Episcopal Zion Church, the Colored Methodist Episcopal Church in America, the Methodist Protestant Church, the Moravian Church, the Presbyterian Church in the United States of America, the Presbyterian Church in the United States (South), the Primitive Methodist Church, the Protestant Episcopal Church, the Reformed Church in America, the Reformed Church in the United States, the Reformed Episcopal Church, the Reformed Presbyterian Church (General Synod), the Seventh Day Baptist Church, the United Presbyterian Church, the United Brethren Church, the United Evangelical Church, the United Presbyterian Church, and the Welsh Presbyterian Church.

FEDERAL TRADE COMMISSION. See TRUSTS.

FEDERATED MALAY STATES. A British protectorate composed of four states in the Malay Peninsula, as follows (area in square miles, population census of 1911):

	<i>Sq. m.</i>	<i>1911</i>	<i>Capital</i>
Perak	7,800	494,057	Taiping
Selangor	3,156	294,035	Kuala Lumpur
Negri Sembilan...	2,550	130,199	Seremban
Pahang	14,000	118,708	Kuala Lipis
F. M. S.	27,506	1,036,999	Kuala Lumpur

See articles on the separate states for individual production. A table of commercial and financial statistics follows, values in Straits Settlements dollars (1 Straits Settlements dollar = \$0.56776) for 1913:

	<i>Imps.</i>	<i>Exps.</i>	<i>Rev.</i>	<i>Expend.</i>
Pk.	34,286,777	71,402,985	23,970,058	25,804,040
S.	42,890,846	56,897,277	15,561,895	16,725,848
N. S.	6,462,551	13,862,762	3,071,799	2,681,530
Pg.	3,268,988	7,006,474	1,729,459	2,076,168

There is no public debt. Railway lines in operation (1914), 771 miles, including 37 miles opened in 1913. The Railways Administration controls the line in the Malay Peninsula, including the Johore State Railways, leased since January, 1912. In 1913 the Singapore Railway had 20 miles in length, which had been leased to the Railways Administration from the colonial government from January, 1912, at a rental of \$150,000, and was purchased for \$4,136,000.

In 1909 a Federal Council was created by an agreement between the high commissioner and the four native rulers, to consist of the high commissioner, the chief secretary, the sultans of Perak, Selangor, and Pahang, the yam tuan of the Negri Sembilan, the four British residents, and four unofficial members nominated by the high commissioner. The first meeting was held Dec. 11, 1909, at Kuala, Kangsar. The Council meets annually, the high commissioner (Sir Arthur Young) presiding.

FEDERATION OF JEWISH FARMERS OF AMERICA. See AGRICULTURAL CREDIT.

FEDERATION OF LABOR, AMERICAN. See LABOR, AMERICAN FEDERATION OF.

Feeble-mindedness. A recent publication issued by the Ohio Board of Administration is of considerable value in relation to the country-wide problem of the feeble-minded. It has been estimated that from 300,000 to 400,000 persons in the United States, equivalent to 0.3 per cent of the population, are feeble-minded, and of these not over one-third are under custodial care. In Ohio there are between 10,000 and 15,000 feeble-minded children, less than 20 per cent of whom are in institutions devoted particularly to their care. Others are to be found in infirmaries, reformatories, and prisons, and others help to swell the number of juvenile delinquents. A mental examination of the inmates of the Girls' and Boys' Industrial School and Home showed that 59 out of 100 girls examined were feeble-minded, 14 were borderline cases, 13 mentally retarded, and only 14 normal. In the case of the boys, out of 100 examined, 46 were feeble-minded, 26 borderline cases, 11 mentally retarded, and 11 mentally normal. The findings in Ohio coincide with those in other States and indicate that from 60 to 80 per cent of the feeble-mindedness is due to bad heredity. This report takes the view that the attempt to discipline and train defective children and then return them to society, is futile. They can never be brought up to normal and to turn them loose on the public

is a blunder, both moral and economic. If both parents are feeble-minded, all their numerous progeny will be mentally defective; while at least one-half of the children will be mentally defective if but one parent is feeble-minded. These people are classified as borderline cases, morons, imbeciles of three grades, and idiots of three grades. They are all instances of arrested mental development, while the insane have retrograded from normal mentality through disease.

FEMINISM. See WOMAN MOVEMENT; and WOMAN SUFFRAGE.

FENCING. The twenty-second annual inter-collegiate fencing tournament was won by the United States Naval Academy. Columbia, which captured the championship in 1914, finished second, and the University of Pennsylvania, third. The individual winners were: foils, H. B. Van Buskirk, Pennsylvania; sabres, R. D. S. Horne, United States Naval Academy.

Dual college competitions resulted as follows: Yale 9, Bowdoin 0; Yale 8, Columbia 1; Yale 5, Harvard 4; Yale 5, Pennsylvania 4; Columbia 5, Pennsylvania 4; Cornell 7, Columbia 2; Cornell 8, Michigan 1; United States Naval Academy 6, Cornell 3.

In the national championships held by the Amateur Fencers' League, Sherman Hall of the New York A. C. won with the foils and J. A. McLaughlin of the Washington Fencers' Club excelled with the duelling swords. The woman's championship with the foils was captured by Miss Jessie Pyle.

FERTILIZERS. To just what extent the supply, price, and use of fertilizers were affected by the disturbed conditions of trade during the year 1915 it was impossible to say at the end of the year, since complete and reliable statistics of the fertilizer industry were not available. Some outstanding features of the situation were the shortage and high price of potash, an advance in the price of nitrate, and a shortage of sulphuric acid for the manufacture of super-phosphates.

POTASH. A large part of the world's supply of potash was cut off by the German embargo in 1914, at a time when there was a greatly increased demand for potash for the manufacture of munitions. The result was such a decrease in the amounts available for agriculture and such an advance in price as to make the use of potash salts as fertilizer in large measure prohibitive. The United States was probably the greatest sufferer from this cause. Normally the United States used about \$14,000,000 worth of German potash salts annually besides \$1,000,000 worth of potassium nitrate obtained indirectly from India. The situation created by the failure of the German supply of potash added impetus to the search for other sources of supply and stimulated inquiry as to practical means of meeting the emergency without impairment of the productiveness of the soil. Attention therefore was directed toward the more liberal use of substances such as lime, gypsum, salt, decaying organic matter, etc., and more thorough tillage, which was believed to increase the availability of the soil potash. These of course were only temporary expedients and would at best only partly meet the needs of the situation. On the other hand, the shortage of potash may in the end prove a distinct advantage to agriculture in that it will force a more careful study of the fertilizer needs of soils with reference to potash

and lead to a more discriminating and profitable use of potash fertilizers. There was good reason to believe that there was a large waste in the use of such fertilizers on lands which did not need them, and hence did not make a profitable return for their use. Many of the soils of the United States are abundantly supplied with potash. Good tillage and the liberal use of decaying organic matter are probably the most effective practical means at the command of the farmer of increasing the availability of this soil potash. Recent investigations indicated that the common estimate of the effectiveness of lime for this purpose was greatly exaggerated. All farm supplies of potash, such as ashes, straw and crop residues, manure, etc., should, of course, be conserved.

It seemed certain that conditions created by the European war would result in the development and permanent establishment of other commercial supplies of potash besides those of Germany. The information available indicated that the potash deposits of Spain are of such extent and character as to warrant the expectation that they will ultimately supply more than the home demand. The inquiries conducted under government auspices in the United States made it plain that America could develop an abundant domestic supply of potash when the commercial conditions justify the investment of the necessary capital. The sources of supply are abundant and the more important technical problems have in most cases been worked out. The four most promising of these sources of supply are considered to be: (1) the giant kelps of the Pacific Coast, the beds of which are more than 400 square miles in extent and are estimated to be capable of yielding, with careful harvesting, six to seven times the normal demands of the United States; (2) the alunite deposits, mainly in the mountains of Utah; (3) the feldspars of the Eastern United States; and (4) the saline muds of Searles Lake in California.

Up to the end of 1915 there was a reluctance to invest capital in the kelp potash industry on account of uncertainty in regard to the State laws governing the harvesting of the kelp. One plant was constructed and another was planned for the production of potassium sulphate from alunite. In addition to the potassium sulphate it is possible to produce a fair grade of alumina and sulphuric acid, which, under favorable conditions, would constitute valuable by-products. An obstacle in the way of the most successful utilization of this source of potash seemed to be the remoteness from commercial centres of the great deposits which were to be used. Inquiry with reference to the production of potash from feldspars had gone far enough to show that this is feasible if a salable by-product, as, for example, cement, could be secured at the same time. Of the large number of desert basins which had been explored in the United States Searles Lake was the only one which seemed to be commercially promising. The brine obtained here contains from 5 to 6 per cent of potash as chloride, but its impurity presents certain serious technical difficulties in preparing pure salts. Development of the industry here was delayed by doubt and litigation as to the title to the property. From none of the sources named was the shortage of potash for agricultural purposes likely to be relieved for many months to come even under most favorable circumstances. The situation,

therefore, had to be met by conservation and discriminating use of such supplies as were available.

In order that the many important experiments with fertilizers in progress in the United States may continue without hindrance an attempt is being made to arrange for the import of a sufficient amount of potash salts for these experiments, the Secretary of Agriculture acting as consignee and guaranteeing that the salts shall be used only for experimental purposes and not sold.

PHOSPHATES. Phosphates are the normal basis of practically all fertilizers since phosphorus is probably the fertilizer constituent most generally needed by soils. Fortunately the world's supply is abundant. The United States especially contains a practically inexhaustible supply of high-grade phosphates. It is becoming increasingly desirable, however, to find practical methods of utilizing more completely the large supplies of low-grade phosphates, and, in general, to improve the methods of manufacture of soluble phosphates. The United States Department of Agriculture was systematically investigating these questions as well as the economic justification of the use of untreated rock. The systematic examinations of the enormous phosphate deposits of the Western United States were continued by the United States Geological Survey with a view to withdrawing from entry and reserving under government control lands underlain by high-grade phosphate. On Jan. 1, 1915, the total area of phosphate lands withdrawn from public entry in Montana, Utah, Wyoming, and Idaho was 2,713,150 acres, constituting perhaps the largest area of phosphate rock yet recognized in the world.

NITROGEN. The nitrogen supply for fertilizers was affected to a marked extent during the year by the greatly increased demand for nitric acid for the manufacture of munitions of war. The conditions stimulated the study of additional means of meeting the need for nitrogen compounds. This is being done partly by the increased use of by-products of coke ovens to save the ammonia produced in coking, the development of processes of fixing the nitrogen of the air, and more intelligent use of city and industrial wastes, especially garbage and sewage sludge. It was found that the two latter can be made to furnish useful components of fertilizers without interfering with the requirements of sanitary disposal. The search for new surface deposits of nitrates had not yielded results of commercial importance.

It is well known that farm manure is subject to large loss of nitrogen under ordinary methods of handling, but the cause of this loss had not been clearly understood. Investigations in England showed that the explanation was to be found in the fact that alternate wetting and drying of the manure causes reduction of nitrates formed on the surface of the manure and consequent loss of nitrogen in the free state. This teaches the practical lesson that if manure can not be promptly spread on the land as it is produced it should be stored under cover and kept as uniformly moist as possible. Another fact of considerable practical importance brought out by experiments with manure was that small amounts of manure might be instrumental in increasing to a considerable extent the effectiveness of green manures, especially leguminous

green manures, by furnishing active bacteria to hasten their decomposition in the soil.

RADIOACTIVE FERTILIZERS. That radium exerts a marked influence upon plant growth was shown by plant physiologists very soon after radium was discovered and its properties began to be studied. Following this discovery the use of radioactive materials as fertilizers was suggested. The results of experiments with such materials, however, up to 1915 was contradictory and inconclusive. Several reports on experiments of this kind, reaching entirely contradictory conclusions, appeared in 1915. Those who had investigated the subject most fully were of the opinion that the amounts of radium which could actually be supplied in this way at prices which would not be prohibitive do not and can hardly be expected to produce any effect upon crop yields. Moreover, as Hopkins pointed out, even if such materials proved effective their use should be adopted with caution since they add nothing to the soil but by stimulating plant growth hasten the exhaustion of the soil.

SULPHUR. Investigation called attention to the fact that sulphur is frequently deficient in soils and suggested that it is possibly a more important element of soil fertility than has commonly been supposed. A number of investigations on the fertilizing effect of sulphur and its compounds were reported. These showed that with certain soils relatively deficient in sulphur the addition of sulphur compounds measurably increase the growth of certain plants, notably legumes and crucifers. Elemental sulphur had not proved as effective as sulphates for this purpose. It was suggested that the beneficial effect observed might be due in part to stimulation of bacterial activity in the soil.

FIJI ISLANDS. A group of South Pacific islands; a British crown colony. The principal inhabited islands are Viti Levu (4112 square miles), Vanua Levu (2432), Taviuni (217), Kadavu (124), Koro (58), Gau (45), and Ovalau (43). Total area, including the dependency of Rotumah (14), is 7435 square miles, a little larger than the combined area of Connecticut and Delaware. Estimated population, Dec. 31, 1913, 153,704. The population at the 1911 census was 139,541 (80,008 males, 59,533 females), of whom 87,096 Fijians, 40,286 (26,073 males) East Indians, 3707 Europeans. Sugar, copra, and fruit (particularly pineapples) are the chief products and exports. Total imports 1913, £903,968 (1910, £870,120); exports, £1,425,940 (£1,005,818). Export of sugar, £1,041,927 (£669,432); copra, £176,741 (£258,914); fruit, £168,249 (£47,301). There is no railway. Suva, the capital, has cable communication with Brisbane and with Canada. Revenue, 1913, £266,031 (£211,952 in 1910); expenditure, £324,528 (£236,661). Public debt, £71,915.

FILTRATION. See **WATER PURIFICATION.**

FINANCE. See sections so entitled under various countries, and under the States of the United States. See also the article **FINANCIAL REVIEW.**

FINANCIAL REVIEW. Under this topic is included a statement of the general aspects of business during the year together with some

treatment of such special topics as the stock exchange, foreign trade, bank clearings, building operations, failures, and business conditions in the particular countries. For additional information relating to business and finance the reader is referred to the following topics: **AGRICULTURAL CREDIT; BANKS AND BANKING; BLUE SKY LAWS; COTTON, Cotton Futures Act; INSURANCE; NATIONAL BANKS; PRICES; SAVINGS BANKS; STATE BANKS; TARIFF; TRUSTS.** See also **LABOR** and various articles there referred to.

GENERAL CONDITIONS. The year 1915 was one of very marked and decisive recovery from the industrial depression of the preceding year, the tide of business operations rising steadily throughout the entire twelve months. Some signs of approaching prosperity had begun to appear at the close of 1914, but that business was still at a low ebb at the opening of the year is shown by the fact that the output of pig iron in December, 1914, was only 1,500,000 tons, the net earnings of the United States Steel Corporation in the fourth quarter of 1914 were less than \$11,000,000, steel mills of the country were working at only 60 per cent of capacity with thousands of idle workmen, steel prices averaged \$2 per ton less than in 1913, railroad earnings were low, and business failures were large. By contrast in 1915 the output of pig iron rose to 3,125,000 tons in October, an amount never before equaled; prices of steel products were high, but steel plants were running at full capacity and were rejecting orders; net revenues of the Steel Corporation rose from \$12,500,000 in the first quarter to \$28,000,000 in the second, and \$38,500,000 in the third. Foreign trade which in 1914 was less than in 1913 or 1912 rose to the unprecedented sum of \$5,290,000,000 in 1915, and exports of merchandise for the 12 months ending with October exceeded imports by the remarkable amount of \$1,626,886,000, and for 1915 by \$1,760,000,000. Likewise the volume of railway freight traffic during the fall of 1915 was never before equaled, some of the roads with Atlantic seaboard terminals being actually under the necessity of refusing freight for ocean shipment. As a result the stock quotations of railroad shares advanced generally 10 to 20 points. This great outburst of business and especially the great volume of orders from abroad for war munitions and supplies resulted in wild speculation on the stock exchange. During January the pessimism of the preceding year gradually gave way to a more hopeful sentiment. Exports were increasing; foreign countries, especially Canadian provinces and cities, Sweden, Norway, and Argentina, placed loans in the American market; the gold pool of \$100,000,000 to meet maturing American obligations abroad was dissolved and the pool for the relief of cotton growers likewise formed in the fall of 1914 became inoperative, only \$28,000 having been applied for; nearly all of the \$384,000,000 of emergency currency and of the \$215,000,000 of clearing house certificates that had been issued since August, 1914, were retired; the stock exchange was reopened, but trading was moderate, only 5,000,000 shares being transferred in January and 4,300,000 in February.

In the latter month the upward tendency became more marked. Exports exceeded imports by \$173,500,000, with the result that sterling exchange declined to \$4.79. This rate contrasted

sharply with the rate of \$7 which had been reached in August, 1914. During March the activities of the stock market increased owing to business conditions and to Supreme Court decisions favorable to the railroads. By one of these the two-cent passenger rate law of Virginia was annulled and by the other the reduction of freight rates on coal by North Dakota was set aside. New York City was able to float a sale of bonds at $4\frac{1}{2}$ per cent; copper rose to $15\frac{1}{2}$ cents per pound, an increase of more than 2 cents; cotton rose by a similar amount to 9 $\frac{1}{4}$ cents; while the price of wheat at Chicago was about \$1.60 per bushel. In April all minimum limits for stock exchange transactions were removed; steel plants were occupied to 70 per cent of capacity; the price of copper rose to 21 cents and the prices of wheat and cotton showed slight advances; but the striking feature of the month was the outburst of speculation on the New York exchange, 21,000,000 shares being transferred. This outburst was due mainly to war orders which resulted in large advances in Bethlehem Steel, American Locomotive, New York Air Brake, and the stocks of motor companies. In May there was some recession in the price of commodities; stocks declined, in part owing to the sinking of the *Lusitania*, but June brought recovery in stock prices. The decision of the Supreme Court against the dissolution of the Steel Corporation brought a favorable movement in stock prices, but the resignation of Secretary of State Bryan caused some reaction. The prices of sterling exchange had continued to fall and the importation of \$40,000,000 of gold did not prevent a decline to \$4.75. Copper prices continued to advance but the price of wheat fell to \$1.04.

The influences favorable to business revival during the first half year continued to operate during the second half. Large contracts with foreign governments for military supplies resulted in wild trading on the exchange in July; steel plants increased their business to 87 per cent of capacity; pig iron production increased and railroad traffic rose considerably. August was marked by the transfer of 20,500,000 shares on the New York exchange; by continued advances in the prices of railroad securities, due in part to the granting by the Interstate Commerce Commission of freight increases to the western roads; the enormous crops produced a favorable reaction on business in general. The decline of sterling exchange to \$4.50 was checked in September by the negotiation of the Anglo-French loan of \$500,000,000. It was during August and September that stock speculation was most reckless, the shares of some of the companies profiting by war orders gaining as much as 30 or 40 points in a day. It was during September also that the railroads began to feel a pressure of freight for export.

The fourth quarter of the year was characterized by the continued increase in the volume of business and the optimism of business sentiment. Another outburst of speculation in war order stocks resulted in the transfer of 28,679,000 shares in October, numerous days being marked by a business of from 1,000,000 to 1,500,000 shares. Bethlehem Steel made a phenomenal advance to 600, having opened the year at $46\frac{1}{4}$, and declining in December to about 460. There were similar but less extreme advances in some other stocks. Pig iron production made a new record

of over 3,000,000 tons in October, and by the middle of November the activity in the steel plants of the country was without precedent. This was due not only to the war orders, but to the fact that unprecedented business encouraged the railroads to spend large sums for cars, rails, and other equipment. The enormous export traffic at eastern ports forced the railroads to reduce free storage time from thirty to fifteen days, there being at one time 50,000 loaded cars on side tracks near New York. This congestion was due in part to the reduction in the number of ocean carriers by the war. In December the attention of the stock market turned somewhat to railroad securities, but considerable gains were still made in the stocks of the war order companies. In spite of the fact that certain roads had gone into receiverships, the relatively favorable condition of railway finances in general was shown by the statistics of the Bureau of Railway Economics. The net revenue per mile of line for roads comprising 228,000 miles rose from \$220 in January and February, to about \$300 per mile in each of the next three months, and to \$477 per mile in September. The net income for these roads in September was 17.4 per cent above the previous five-year average, and subsequent months were not less favorable. The increase in net revenue of railways over 1914 was estimated at \$168,955,000. The foreign trade for October totaled \$477,000,000 and for November, \$495,000,000. The excess of exports over imports reached the maximum of \$178,857,000 in October. During every month of the year there was an excess of gold imports over gold exports, the maximum of \$76,731,000 being in October and the total excess for the year being \$429,000,000. Moreover, extra dividends on the stocks of copper, oil, and powder companies were declared. Steel prices reached the high average of \$39.70 per ton, a gain of \$7.50 since August and of nearly one-third since 1915 and the highest average in eight years.

CROPS. Not a little of the great prosperity of the United States during 1915 was due to new records in farm production. Thus the wheat crop for the first time exceeded 1,000,000,000 bushels, the actual production being 1,002,029,000 bushels. This was an increase of 110,000,000 bushels over 1914. The corn crop exceeded that of the previous year by over 400,000,000 bushels, reaching the enormous amount of 3,090,000,000 bushels. Oats likewise set a new maximum of 1,517,478 bushels, while barley with 236,682,000 bushels was 20 per cent in excess of the 1914 crop. The total value of all farm products including grain, vegetables, fruits, and animal products for the year was estimated at \$10,000,000,000.

PIG IRON PRODUCTION. One of the best indexes of business conditions is the volume of pig iron production. During the last four months of the year this averaged about 3,000,000 tons. This contrasted with 1,801,000 tons in January. The output increased steadily every month until October, the total for the year being about 29,796,000 tons, an amount exceeded only in 1912 and 1913, and being about 6,500,000 tons greater than in 1914. The total for the year may be compared with a total of 30,724,000 tons in 1913; 29,727,000 in 1912; and 23,649,000 in 1911.

AUTOMOBILE INDUSTRY. A notable feature of the year's industry was the great expansion in the automobile manufacture. It was estimated

that the retail value of cars and trucks sold in 1915 aggregated \$691,778,000. This included 842,249 passenger cars at \$565,856,000; and 150,369 trucks at \$125,922,000. Exports were estimated at \$100,000,000 or two and one-half times as great as in 1914; of this sum about two-thirds was for commercial vehicles. See AUTOMOBILES.

STOCK EXCHANGE. The changes in business sentiment were reflected in the activities of the New York Stock Exchange, though this statement must be qualified on account of an excessive and unreasoning spirit of speculation which prevailed during April and during the fall months. It was this speculative fever which undoubtedly made the total shares exchanged for the year greater than in any year since 1909. The number of shares sold by months were as follows: January, 5,076,210, February, 4,383,449, March, 7,862,308, April, 21,022,930, May, 12,581,040, June, 11,004,042, July, 14,371,633, August, 20,432,350, September, 18,399,286, October, 26,678,953, November, 17,634,270, December, 14,647,000. Total for the year, 173,000,000 shares. That these figures represent an extraordinary volume of business is shown by comparison with totals for previous years: 1914, 47,900,568; 1913, 83,470,693; 1912, 131,128,425; 1911, 127,207,258; 1910, 164,150,061; 1909, 214,632,194. The speculative fever was also reflected in the phenomenal advances of some of the stocks. The advances were due almost entirely to the great volume of European trade due to war orders. The stocks of these companies came to be known popularly as "war brides." The following are a few instances of the advances during the year shown by first and last quotations of the prices of common stocks: Anaconda, 50 to 91; Baldwin Locomotive, 40 to 117; Bethlehem Steel, 46 to 459; General Motors, 82 to 500; Studebaker, 36 to 167; Industrial Alcohol, 20 to 121; Crucible Steel, 18 to 73; Continental Can, 40 to 84; Lackawanna Steel, 28 to 81; Tennessee Copper, 32 to 63. These prices were less in all cases than the maxima attained in the fall. Thus Baldwin Locomotive went to 154 on October 23rd; Bethlehem Steel to 600 on October 22nd; General Motors to 559 on December 9th; Studebaker to 195 on October 22nd; and Lackawanna Steel to 95 on September 29th. Toward the end of the year interest attached to railroad shares and the stocks of all the principal railroads of the country showed considerable advances with the exception of Missouri, Kansas and Texas, Missouri Pacific, and Wabash, which were in financial difficulties.

The bond market reflected somewhat the same wide-spread interests in investments. The transactions on the New York exchange by months were as follows: January, \$57,100,500, February, \$43,842,500, March, \$63,214,500, April, \$110,359,500, May, \$64,284,200, June, \$57,957,000, July, \$55,535,500, August, \$72,253,000, September, \$80,741,000, October, \$105,191,500, November, \$130,088,500, and December, \$120,110,000. Total for the year, \$956,500,000 par value. While the advances in bond prices were not phenomenal yet there was a general upward movement for the bonds of the government, of railroads, and of industrial companies, ranging from 1 per cent to 6 per cent. The total transactions for the year were exceeded in 1909, but not in any subsequent year. The

totals for immediately preceding years were: 1914, \$461,526,600; 1913, \$501,571,020; 1912, \$675,213,500; 1911, \$890,210,100; 1910, \$634,722,850; 1909, \$1,317,291,000. The ease of the bond flotations showed the abundance of available money due to the revival of prosperity and especially to the enormous export trade. In this connection reference should be made to the foreign credits established during the year and noted below. One notable result of the year's transactions was the increase in the number of stockholders of principal corporations. A summary for 23 railroads, 14 public utility companies, and 28 industrial corporations showed an increase of 25,447 in the number of stockholders during the year.

Another important result was the great absorption of American securities previously held abroad. When the war began the par value of American securities held abroad was estimated variously from \$4,000,000,000 to \$6,000,000,000. Mr. L. F. Loree, President of the Delaware and Hudson Company, after a thorough study of American railway securities held abroad, concluded that their par value was \$2,223,000,000, and their market value, July 31, 1915, was \$1,751,000,000; industrials owned abroad on that date were estimated \$518,300,000 par value. His inquiry showed that \$480,892,000 par value of these railway securities were sold in America in five months; it was known that during this same period \$140,000,000 par value of industrial securities were also exchanged. On this basis it was estimated that during the year more than \$1,000,000,000 of stocks and bonds previously held abroad were bought by American investors. The remarkable financial strength of the country made possible not merely the repurchase of these securities, but also the extension of credits aggregating \$1,000,000,000, besides which gold imports exceeded exports by over \$425,000,000.

SECURITIES. According to the *Journal of Commerce* the total authorized capital of all companies incorporated in the United States in 1915 with a capital of \$100,000 amounted to \$2,061,000,000, an increase of over 30 per cent compared with 1914. For companies with a capital of \$1,000,000 or more incorporated in the Eastern States this paper reported an aggregate of \$1,426,000,000. This amount compared with \$894,947,000 in 1914, and \$1,534,000,000 in 1913.

The actual issues of securities by railroads in 1915 aggregated \$780,216,000. Of this \$541,350,000 were bonds, \$216,515,000 notes, and \$22,350,000 stocks. Industrial companies issued a total of \$655,134,000, including \$241,838,000 bonds; \$110,918,000 notes, and \$302,377,000 stocks. Moreover, the *Daily Bond Buyer* reported during 1915, 5181 issues of long-term State and municipal bonds aggregating \$482,220,000, the largest amount of such securities ever issued in one year.

BANK CLEARINGS. The bank clearings for 137 cities reached the enormous sum of \$186,079,731,000, an amount never before equaled, and exceeding the previous maximum in 1912 by 7.8 per cent. During the first quarter the clearings aggregated \$38,915,000,000; second quarter, \$43,427,000,000; third quarter, \$44,271,000,000; fourth quarter, \$59,466,000,000. For the month of December the total was \$20,167,000,000, or .5 per cent more than in October or

November, in either of which the clearings exceeded those of any previous month in American history. By geographical divisions the clearings for the year were as follows: New England, \$8,838,236,000; Middle, \$23,939,698,000; Western, \$7,189,399,000; Northwestern, \$21,678,344,000; Southwestern, \$9,926,078,000; Southern, \$6,865,044,000, and Far-Western, \$6,642,930,000. At principal centres the clearings were: Boston, \$8,256,935,000; New York, \$110,204,392,000; Philadelphia, \$8,863,633,000; Pittsburgh, \$2,666,312,000; Chicago, \$16,198,985,000; St. Louis, \$4,153,535,000; Kansas City, \$3,835,061,000; Baltimore, \$1,833,648,000; San Francisco, \$2,693,688,000; Los Angeles, \$1,048,128,000.

Canada. Bank clearings in Canada were slightly less than in 1914, amounting to \$7,653,000,000, a decrease of .4 per cent from 1914. Slightly more than one-third of all clearings were at Montreal, nearly one-fourth at Toronto, and one-fifth at Winnipeg.

FAILURES. In spite of the many indications of business prosperity, the number of commercial failures in 1915 exceeded those of any previous year. R. G. Dun & Co. reported 22,150 suspensions in 1915, with aggregate indebtedness of \$302,286,000; similar figures for 1914 were 18,280 and \$357,908,000. *Bradstreet's* reported 19,032 failures with \$283,432,000 liabilities, these figures being respectively 13.4 per cent higher and 20.7 per cent lower than in 1914. The liabilities were, moreover, 26 per cent less than in 1907 or 1893, but the number of failures had never been equaled. The business mortality was very high, but as conditions improved in various lines, failures became fewer. In the fourth quarter the number was 37 per cent less and the liabilities 50 per cent less than in the first quarter.

Likewise railway receiverships of the year were unusually numerous, the mileage under receiverships being the greatest in nearly 20 years. The total mileage was 39,905; and the par value of bonds represented \$1,678,129,000, and of stocks, \$707,603,000. The most important lines were the Chicago, Rock Island, and Pacific; the Missouri Pacific; the St. Louis and San Francisco; the Missouri, Kansas, and Texas; the Wabash; the Texas Pacific; and the Pere Marquette. It was alleged that one factor in many cases was the restrictive legislation of Southwestern States, notably Oklahoma and Texas.

Canada. Failures in Canada reached the number of 2621, a decrease of 9.1 per cent from 1914, but exceeding the number in any previous year. The liabilities aggregated \$31,989,000, an increase of 4.2 per cent over 1914, and greatly exceeding any other year.

BUILDING. According to *Bradstreet's* the building operations in 155 American cities aggregated over \$806,000,000 in 1915. This was an increase of 4.5 per cent over the total for 1914. Nevertheless, during the first seven months, the building expenditures were less in each month than in the corresponding month of 1914, except in May, when there was an increase of .3 per cent. During the last five months there was an increase each month over 1914. While the figures for the first nine months showed a decrease of 5 per cent from those of 1914, the last quarter of 1915 showed expenditures exceeding those of the last quarter

of 1914 by 53.2 per cent. See also BUILDING OPERATIONS.

AMERICAN INTERNATIONAL CORPORATION. This organization was incorporated in New York about December 1, under the direction of the National City Bank. It was capitalized at \$50,000,000. Its purpose was to develop American trade with foreign countries, promote the investment of American capital in industrial projects in foreign lands, and develop markets abroad for American goods. The charter of the company empowered it to deal in securities, acquire concessions, make explorations, develop mines, smelt ores, build houses and factories, construct telephone and telegraph lines, wharves, and reservoirs, and indeed to do whatever was necessary in carrying on legitimate business. Among its directors were Frank A. Vanderlip, president of the National City Bank; Otto H. Kahn, of Kuhn, Loeb and Company; J. Ogden Armour of Chicago; James J. Hill, of the Great Northern Company; William E. Corey, of the Midvale Steel Company; and many other well-known financiers and industrial promoters. This corporation was formed under the leadership of the National City Bank which was carrying out a policy of establishing branches in principal South American cities, and which had acquired control of the International Banking Corporation with its 16 banks in China, Japan, India, the Philippines, Panama, and elsewhere.

FOREIGN CREDITS. One of the most unique and remarkable features of the financial history of the year was numerous and large foreign loans or credits floated in this country. It was estimated that their total exceeded \$1,000,000,000, and that about 80 per cent of the proceeds were expended in this country for war supplies of all kinds. The Canadian government secured a 5 per cent loan amounting to \$45,000,000, while 8 Canadian Provinces and 10 Canadian cities borrowed a total of \$102,000,000. Various Latin-American countries secured a total of \$50,000,000, of which Argentina secured \$15,000,000 on notes and \$31,000,000 on treasury bonds. Small loans or credits to various European countries were as follows: Switzerland, \$15,000,000; Sweden, \$5,000,000; Norway, \$8,000,000; Greece, \$7,000,000. German treasury notes to the amount of \$10,000,000 were sold in the United States. Russia, which placed orders for war supplies amounting to \$70,000,000 in the single month of October, and had previously placed orders estimated as equally great, secured one loan of \$32,000,000, and late in December was negotiating a second loan of \$60,000,000 to run for 90 days, but renewable up to 18 months. According to announcement this new loan would bear 5 per cent and 1 additional per cent for each 90 days' extension. Italy secured \$25,000,000 on one year 6 per cent notes convertible at maturity into 6 per cent one year bonds; these latter were in turn exchangeable for 10 year 5½ per cent bonds. In addition to the Anglo-French loan noted below, France secured \$75,000,000 on notes, bonds, and collateral; and London banks \$50,000,000 for six months. At the close of the year plans were under way also for additional credits for both France and Great Britain, to be based on American securities mobilized by the bank of England and the bank of France.

ANGLO-FRENCH LOAN. The most notable for-

FOUR FINANCIERS OF THE GREAT WAR

eign loan ever floated was that negotiated by England and France. Various small credits and gold imports of more than \$150,000,000 had not prevented sterling exchange at New York from falling to about \$4.50; normally it is \$4.86, and in August, 1914, it had been nearly \$5. In September, a commission of British and French financiers, including Baron Reading, Lord Chief Justice of England, as chairman, and noted English and French bankers and publicists, came to the United States to negotiate a loan through prominent American bankers. It was stated that their original desire was to establish a credit for \$750,000,000 or even \$1,000,000,000, but after various conferences led on the part of American financiers by J. P. Morgan and Company, the sum of \$500,000,000 was fixed upon. An extensive underwriting syndicate was formed in which banks from all parts of the country participated, though some banks in various sections refused to join. Refusal was due in part to financial reasons and in part to sentiment. A vigorous effort was made by some of the leading German-Americans to prevent the participation of banks, especially savings banks, in the loan; and this was accompanied by proposals for the establishment of German-American banks in New York and Chicago. The American Truth Society formed by Germans in this country held meetings in 35 cities in opposition to the loan; it later issued a list of 56 banks taking part in the loan which were "not to be forgotten nor forgiven." The loan was taken by the syndicate at 96 or on a basis to yield an average $5\frac{1}{4}$ per cent and sold to investors at 98 or so as to yield for the 5-year period during which the securities run, about $5\frac{1}{2}$ per cent. The privilege of converting these securities into $4\frac{1}{2}$ per cent bonds running from 15 to 25 years was included. The subscription list was closed early in October, and a total was exceeded by some \$50,000,000. The largest individual subscription was \$35,000,000; there was one of \$20,000,000; one of \$15,000,000; and three of \$10,000,000 each. The first installment of 25 per cent was due October 15; a second installment of 25 per cent was due November 15; and a final installment of 50 per cent was due December 15. The loan had momentous consequences in preventing the breakdown of European exchange. It thus made it possible for England and France to continue their purchases of war supplies in the United States, a condition which reacted powerfully upon the condition of American manufactures.

FEDERAL REVENUE. The great decline in import duties which had made necessary emergency taxes in 1914 continued to be a cause of anxiety to treasury officials during 1915. It became evident early in the year that existing legislation would probably produce only barely sufficient revenue to carry the government's finances to the close of the calendar year. Moreover, when it became evident that the Administration was determined to enter upon a policy of greatly increased expenditures for the army and navy, it was perfectly certain that new sources of revenue would need to be devised. This additional revenue could be secured from an expansion of existing taxes or from new taxes, or from the sale of bonds. Either policy was evidently fraught with political dangers and economic difficulties. It was generally agreed that the income tax, which in

the fiscal year 1915 yielded only \$40,000,000, was capable of yielding a much larger return; also that a Federal inheritance tax was also likely to prove a fruitful source of revenue. Early in December Secretary of the Treasury McAdoo suggested that the emergency revenue law which would expire on December 31st be reenacted; that the law providing that sugar should be free of duty after May 1, 1916, be repealed; that the income tax rate be raised; that the exemption limit of the income tax be lowered from \$4000 to \$3000 for married men, and from \$3000 to \$2000 for single men; that the income surtax begin at \$10,000 or \$15,000 instead of \$20,000; and that taxes be imposed on gasoline, crude or refined oil, and on automobiles and other internal combustion engines according to horse power. Members of Congress proposed taxes on the profits of the manufacture of munitions; or an increase of the taxes on whiskey and beer.

Most of the proposals of Secretary McAdoo's programme above outlined were approved by the Administration. In December a caucus of House Democrats voted in favor of extending for one year the emergency tax law. On the 16th a joint resolution to this effect passed the House by a vote of 205 to 189, all Republicans and 5 Democrats voting in the negative. In the Senate the resolution carried by a vote of 45 to 29. The discussion of this proposal was largely partisan in character, and brought out the opposed policies of the two parties regarding the protective tariff.

ENGLAND. The most conspicuous feature of English financial history of the year was the prodigious efforts of the government to finance the war. The direct cost of the war to Great Britain up to the close of 1915 was estimated at \$8,000,000,000, of which some \$6,500,000,000 represented the cost during 1915. This had been met for the most part by loans, but also in part by taxation. In addition to previous taxes, over \$1,000,000,000 was raised by new taxes; and at the close of the year further taxes were in contemplation. The stock exchange at London, which had been closed in August, 1914, was reopened in January. The valuation of 387 representative British stocks by the *Bankers' Magazine* showed a decline in the aggregate market value of these stocks of \$900,000,000 in the latter days of July, 1914; of nearly \$350,000,000 more between August 1 and February 1; and of over \$700,000,000 additional decline between Feb. 1 and Dec. 1, 1915. This shrinkage was striking evidence of the unfavorable condition of general industrial operations. The war necessitated a great shift of both labor and capital to new lines of production (see UNEMPLOYMENT). The foreign trade of England showed an excess of imports in each month of 1915 over the corresponding month of 1914, with the exception of January, in which the imports of the two years were practically the same. On the contrary, the exports were smaller in each month than in the preceding year. The total imports of the year exceeded \$4,270,000,000, as compared with \$3,500,000,000 in 1914. The total exports amounted to \$1,925,000,000, as compared with \$2,180,000,000 in 1914. The tremendous financial strength of Great Britain was revealed by the fact that she had extended credit to her allies in large amounts, had exported gold to the amount of \$400,000,000, and

yet in spite of a most unusual unfavorable trade balance, had suffered a loss of only \$100,000,000 net in her gold holdings: this was owing largely to the inflow of gold from South Africa and Australia.

FRANCE. The war almost completely interrupted the foreign trade of France. It was estimated that from the beginning of the war, France had produced from her own agriculture and manufactures five-sixths of all her supplies. The Paris Bourse was reopened late in the year, and the curb market resumed partial activity. Also toward the end of the year the liquidation of accounts suspended since July, 1914, was resumed. From August, 1914, to November, 1915, the government paid out \$5,200,000,000. Of this sum \$1,000,000,000 was secured from regular taxes previously imposed; no new war taxes were enacted, though a revision of the income tax became effective Jan. 1, 1916. The bank of France had, up to Nov. 1, 1915, advanced \$1,400,000,000 to the government. Moreover, this bank held gold slightly in excess of \$1,000,000,000 at the close of the year, although it had sent \$140,000,000 gold to England, \$40,000,000 to the United States, and an equal amount to Italy and Greece; moreover, its gold reserve at the outbreak of the war was only \$615,000,000. During the latter half of 1915 an especial effort was made by the government to accumulate the gold hordes of the French people, with the result that from July 1 to December 1, \$250,000,000 in gold was sent in. Perhaps the most notable event of the year was the flotation of the "Loan of Victory" in the closing months. The total subscriptions to this were not known at the close of the year, but they approximated \$2,900,000,000 from all classes of the population. Payments were made to a considerable amount in gold, and the amount paid in exceeded that due.

GERMANY. In Germany the year brought no considerable changes in industry. The Boerse operated unofficially during the greater part of the year. Statistics as to foreign trade were lacking, though it was known that the overseas trade was almost eliminated. It was stated that the Boerse had reflected the prosperity of industries engaged in the manufacture of war supplies in that a real boom of war shares occurred during the summer; with excessive speculation. It was claimed that the prosperity of the country was evidenced by the increase of deposits in savings banks. At the outbreak of the war these banks held aggregate deposits of nearly \$5,000,000,000. Up to June 3, 1915, the new deposits were estimated at \$500,000,000; and it was estimated that the total increase in savings deposits from the outbreak of the war to the close of 1915 was \$750,000,000. The most striking financial events were the war loans.

881,000,000. There were 2,113,000 subscribers to the March loan, and 2,884,000 to the September loan. Over 90 per cent of the latter loan had been paid in at the close of the year, although only 75 per cent was due.

FINLAND. A grand duchy of the Russian Empire situated on the Gulf of Bothnia. Capital, Helsingfors.

AREA AND POPULATION. Area in square kilometers and population by governments, Dec. 31, 1910, follow:

	Sq. km.	Pop.
Nyland	11,872	376,218
Abo-Bjorneborg	24,171	499,882
Tavastehus	21,584	342,321
Viborg	43,055	521,469
St. Michel	22,840	198,829
Kuopio	42,780	388,777
Wasa	41,711	514,940
Uleaborg	165,641	328,811
Total	373,604*	3,115,197

* Of which, 47,829 sq. kilometers internal waters.

The total area in square kilometers is equivalent to 144,249 square miles. The population was 33 per square kilometer in Nyland (greatest density), and 2 in Uleaborg (the least), and the average density for the country was 9. Evangelicals numbered 3,057,627, Greek Orthodox, 52,004, Baptists, 4467, Methodists, 676, Roman Catholics, 423. Speaking Finnish as their native tongue were 2,565,742, Swedish 344,364, Russian 7339, German 1794, Lapp 1660, other tongues 298. Total population as estimated Jan. 1, 1913, 3,196,700; 1911, 3,154,824. Of the 2,712,562 adults listed as actively pursuing occupations, 1,555,357 were engaged in agriculture. Helsingfors had 161,091 inhabitants in 1912, Abo 52,057, Viborg 28,257, Tammerfors 46,192, Nikolafstad 23,275, Björneborg 17,072, Uleaborg 21,271, Kuopio 16,266.

Education is on a much higher plane than in Russia. Primary instruction is free and compulsory between the ages of 7 and 15. Secondary schools are well attended, and special schools of agriculture are maintained, devoting particular attention to stock raising and dairying.

PRODUCTION AND COMMERCE. Cereal crops are grown; also roots and forage plants. The timber industry is important. Iron ore is mined, and pig and bar iron are produced for export. In 1912 the harvest yielded 42,283 hectolitres of wheat, 3,656,630 of rye, 1,795,000 of barley, 7,416,030 of oats, 6,630,110 of potatoes. Revenue from crown forests in 1913, 13,517,512 marks; expenditure, 3,283,960.

The trade by countries of origin and destination, with values in thousands of marks (gold), is shown below for three years:

	Imports		Exports	
	1911	1912	1911	1912
Germany	173,400	186,767	202,585	46,500
Russia	137,500	131,676	140,198	89,000
United Kingdom	61,700	68,335	60,660	88,100
Denmark	23,071	26,087	28,094	11,700
Sweden and Norway	21,600	25,218	29,358	14,500
France	6,400	7,437	7,113	11,653
Spain	2,200	2,286	2,692	27,100
Other	18,587	22,289	24,789	8,700
Total	444,500	420,082	495,434	319,600
				370,040
				404,799

The subscriptions to a loan in March totaled \$2,167,000,000; and to that of September, \$2,-

The principal articles of export are timber, paper and pulp, butter, hides and leather,

wooden wares, fish, cotton textiles, iron. Vessels entered (1913), 11,901, of 3,696,330 tons; cleared, 11,937, of 3,628,905. Merchant marine (Jan. 1, 1913), 3547 vessels, of 408,660 tons (507 steamers, of 71,297).

COMMUNICATIONS. Railways in operation Jan. 1, 1913, 3763 kilometers. At the beginning of 1914 the total mileage of the Finnish State Railways, including 207 miles of line owned by private capital, but operated by the state lines, was 2537. Finland has 2765 miles of navigable waterways, of which, with the existing facilities, it was estimated that the freight capacity is about 1,600,000 tons a year. The waterways, as well as the railways, are under the administration of the state. The Russian government has decreed that all new lines are to be constructed in conformity with Russian lines, that existing lines are to be so altered as to permit the use on them of Russian rolling stock. With the completion of the Kaskö-Kristinestad line will be begun extensions of present lines to form a continuous route from Nikolaiestad to Petrograd. The projected alterations and extensions were decided upon, not by the Diet of Finland, but by Russia; though the Finnish railways are for the most part owned by the Finnish government.

FINANCE. The revenue for the year 1913 (figures are from an English source) amounted to £6,796,715 ordinary and £20,610 extraordinary (£22,050 from funds); of which £3,004,905 was derived from state domains and forests, railways, canals, etc.; £2,709,666 from indirect taxes (customs and excise), £244,860 from direct taxes, etc. Expenditure, £5,953,867 ordinary and £956,442 extraordinary (£22,281 for funds); of which £1,917,015 for communications, £785,411 for worship and instruction, £574,122 for civil administration, £531,882 military contribution, £301,019 debt charge, £292,864 for agriculture, etc., £281,156 for commerce and industry, etc. The military contribution goes into the Russian treasury. The debt stood Jan. 1, 1914, at £6,485,352.

GOVERNMENT. Until the present régime Finland enjoyed the autonomy guaranteed her in the reign of Alexander I. Latterly the Russification system has been applied to an increasing number of departments, until the schools, the press, the law, and the legislature have all been invaded. By the end of 1912 the constitution was virtually annulled. The Diet (200 members) elected by universal suffrage for three years, formerly possessed of large powers in civil administration, has latterly been little more than a figurehead. The Russian sovereign is the grand duke. There is a resident governor-general, and a secretary of state residing at Petrograd.

FINLAY, CHARLES JOHN. Cuban scientist and biologist, died Aug. 20, 1915. He was born in Cuba in 1833, and received his education in France, and at the Jefferson Medical College, Philadelphia, from which he graduated in 1855. He took up practice in Cuba, and in 1881 made the discovery that the mosquito was a disease spreader. This theory was at first received with ridicule, but Dr. Finlay continued his experiments, and in the last-named year his theory was established by tests in the transmission, through the bites of mosquitoes, of yellow fever. Five years later his discovery received atten-

tion from medical journals, and gradually came to be accepted. In 1899 the United States Army Commission proved the correctness of the theory through the work of Major Reed, Dr. Lazear, and their associates. These men took Dr. Finlay's data as a basis for their investigation. Dr. Finlay was chief sanitary officer of Cuba from 1902-08. He belonged to many medical associations in Cuba, and in other countries.

FIRE INSURANCE. See **INSURANCE.**

FIRE PREVENTION. See **FIRE PROTECTION.**

FIRE PROTECTION. Increased attention was being paid to methods of fire prevention as distinct from fire fighting in many fire departments throughout the United States during 1915. This involved more inspection by members of the uniformed force, the formulation and enforcement of new regulations, and the arousing of public sentiment to realize disadvantageous conditions where they existed. This side of the matter had been too much neglected in American fire departments in the past, and it was to be hoped that fire department efficiency would be regarded on the basis of the small number of fires rather than on the number of fires occurring and extinguished with small loss. But the movement was not confined exclusively to fire departments. Better statutes were being passed to afford increased protection and to punish neglect and carelessness; better building construction was being secured through improved building codes and otherwise (see **BUILDING OPERATIONS**), and in general a more enlightened public sentiment was supporting legislators and officials in their plain duties, not to mention increased attention to proper fire protection by factory owners as well as individuals in their homes and other buildings.

LIABILITY FOR FIRES. An interesting and noteworthy development in American fire protection is the assessing of damages due to fire on the owner of premises where a fire originates through neglect, carelessness, or violation of rules and regulations. A law, signed by Governor Brumbaugh of Pennsylvania on May 6th, applied this principle to cities of the second class in that State. The essence of the law was as follows:

Where a fire originates on the premises occupied by any person, firm, or corporation as a result of his or its criminal intent, design, or wilful negligence, or where said person, firm, or corporation has failed to comply with any law or ordinance made for the prevention of fire or the spreading thereof, such person, firm, or corporation shall be liable in a civil action to the city for the payment of all costs and expenses of the fire departments incurred in the extinguishment of or any attempt to extinguish any fire originating as aforesaid. The amount of such costs and expenses shall be based upon the wages of the firemen and other officers for the time they were engaged, a reasonable amount as rental for the use of the apparatus and the cost of the water and other materials used, with an additional amount of 10 per cent on the total amount as overhead charges.

In 1915 there was a general improvement to be noted in fire-fighting facilities due largely to the general acquisition of motor apparatus; and in part, as a result, the number of fires

quenched soon after their incipency was increased, particularly in the smaller towns. The appreciation of proper equipment was thus being brought home to city authorities. An interesting development in the way of apparatus for small fire departments was a chemical engine carried on an ordinary Ford car. This was equipped with two 25-gallon chemical tanks, 150 feet of $\frac{3}{4}$ -inch chemical hose and a nozzle, two special fire department extinguishers, lanterns, rope, axes, and other appliances. Various types of motorcycles and tricarcs were also equipped with fire extinguishers, and even in the smallest villages a tendency was manifested of having available at least some simple apparatus and one or more men who understood its use to send out in case of fire.

In New York City in 1915 there were 1004 fewer fires than in 1914, with a reduction also in the average loss. This was due to the various fire prevention methods which had been enforced by the Fire Department, including better housekeeping, better construction, better fire-proofing of shafts and stairways and other openings, better inspection, and increased supervision by fire department officials. The work in fire prevention was securing results, and it was believed that the city was in better shape to resist fire than ever previously.

AMERICAN FIRE LOSSES IN 1915. The losses by fire in the United States and Canada during 1915, as recorded by *The Journal of Commerce and Commercial Bulletin* (New York), aggregated \$182,836,200, or a decrease of \$52,755,100 from the figures of the year 1914, which were \$235,591,350. The fire loss record for 1915 was the smallest since 1905, when the figures recorded were \$175,193,800. This decrease of fire losses was considered a most encouraging sign and seemed to show that the various campaigns for fire prevention and protection had not been without results.

There were no serious conflagrations during the year, and while some 28 fires resulted in an estimated property damage of \$500,000 or over, only one amounted to more than \$2,000,000. The fires of \$500,000 or over during the year were the following:

Location—Description	Estimated damage
Philadelphia, Pa., lumber yards and other...	\$500,000
Bayonne, N. J., lumber yards and other...	800,000
Trenton, N. J., wire rope works.....	1,000,000
Detroit, Mich., office building.....	700,000
Warrensburg, Mo., school building.....	500,000
Champaign, Ill., business district.....	500,000
Spokane, Wash., business block, etc.....	500,000
Poughkeepsie, N. Y., oil works.....	500,000
Russellville, Ala., business section of town...	500,000
Fresno, Cal., winery.....	500,000
Oswego, N. Y., match factory and lumber...	600,000
Newport News, Va., grain elevator and other...	2,000,000
Los Angeles, Cal., grocery warehouse.....	1,000,000
Chicago, Ill., furniture factory, church and other.....	500,000
Ardmore, Okla., business section.....	500,000
Marshall, Tex., railroad shops.....	700,000
Richmond, Va., tobacco warehouse.....	500,000
Seattle, Wash., steamship pier.....	500,000
Augusta, Ga., cotton compress and cotton...	500,000
Clifton, Ariz., copper mine works.....	750,000
Bethlehem, Pa., ordnance works.....	1,500,000
Trenton, N. J., steel rope works.....	1,000,000
Altus, Okla., cotton and compress.....	500,000
Pine Bluff, Ark., warehouse and cotton.....	1,000,000
Alabon, Cal., half business portion of town...	1,000,000
Hopewell, Va., almost whole town.....	1,100,000
Erie, Pa., grain elevators.....	1,000,000
Chicago, Ill., linseed oil plant.....	2,000,000

During the 39 years ended 1915 the fire losses for the United States and Canada had attained the stupendous total of \$6,049,817,225, or an average annual loss of \$155,122,518. The following tabulation shows the losses by years and emphasizes the improved record for 1915:

FIRE LOSSES DURING PAST THIRTY-NINE YEARS AGGREGATE \$6,049,817,225		
1915.....	\$182,836,200	1895.....\$129,835,700
1914.....	235,591,350	1894.....128,246,400
1913.....	224,728,350	1893.....156,445,875
1912.....	225,820,900	1892.....151,516,000
1911.....	234,337,250	1891.....143,764,000
1910.....	234,470,650	1890.....108,893,700
1909.....	203,649,200	1889.....123,046,800
1908.....	238,562,250	1888.....110,885,600
1907.....	215,671,250	1887.....120,283,000
1906.....	459,710,000	1886.....104,924,700
1905.....	175,193,800	1885.....102,818,700
1904.....	252,554,050	1884.....110,008,600
1903.....	156,195,700	1883.....110,149,000
1902.....	149,260,850	1882.....84,505,000
1901.....	164,347,450	1881.....81,280,000
1900.....	163,362,250	1880.....74,643,400
1899.....	136,773,200	1879.....77,703,700
1898.....	119,650,500	1878.....34,315,900
1897.....	110,319,650	1877.....68,265,800
1896.....	115,653,500	
Total for thirty-nine years.....\$6,049,817,225		

During the year the engineers of the National Board of Fire Underwriters worked out a proposed scheme of relative values for fire defenses and physical conditions of the various towns and cities. This scheme was adopted tentatively by the Actuarial Bureau with the consent and approval of the Executive Committee of the National Board, and was of interest as showing the various factors to be considered in reaching an estimate of the facilities for resisting fire possessed by a community. The table is based on a maximum of 5000 points, and the relative values are as follows:

Relative Values (Maximum 5,000)	
Water supply.....	1,700
Fire department.....	1,400
Fire alarm.....	550
Police.....	50
Building laws.....	200
Explosives and inflammables.....	200
Electricity.....	150
Natural and structural conditions.....	750
	5,000

Working on the above scheme it was proposed to classify the various towns and cities according to their merit. The first class would be cities and towns where the deficiency from the above maximum did not exceed 500 points; second, 500 to 1000; third, 1001 to 1500; fourth, 1501 to 2000; fifth, 2001 to 2500; sixth, 2501 to 3000; seventh, 3001 to 3500; eighth, 3501 to 4000; ninth, 4001 to 4500; and the tenth representing a deficiency of 4501 to a condition without fire protection at all. The scheme was worked up in detail, and the various elements of apparatus, water distribution systems, etc., were all considered.

During the year there was an extension of high pressure systems, and of this form of protection. This subject was taken up in a paper on "Fire Protection" read at the International Engineering Congress by John R. Freeman, and in the discussion it was stated that high pressure systems are only available where there is a large and properly trained department. Nevertheless, the construction and extension of such systems were in progress, and Cincinnati,

Ohio, was installing for a congested area district a system surrounded by a 20-inch ring main, with two 16-inch cross mains, with 12-inch lines grid-ironing the district, with four valves at each crossing, and three at each T, so that any block or blocks could be cut off without interference with the supply of the others. The high pressure pumping station is located at 8th Street and Eggleston Avenue, and takes filtered water at 55 pounds pressure from three city mains, and has a capacity of 75,000,000 gallons per day. The hydrants are designed for a working pressure of 300 pounds per square inch and are tested to 600 pounds. These hydrants are set in vaults with other tubes about 4 inches below street level. The port directors of Boston approved the proposed site for a high pressure pumping station at the corner of Dorchester Avenue and Summer Street bridge. Several miles of high pressure mains were laid through the city in 1914, and a corresponding amount in 1915.

During the year a number of serious fires occurred in establishments devoted to the manufacture of various munitions of war. Thus, on November 10th, a fire at the Bethlehem Steel Company's works, Bethlehem, Pa., destroyed a machine shop with a loss estimated at \$1,500,000 or less. This was said to be due to a short circuit igniting oil in one portion of the plant. On December 9th the new city of Hopewell, Va., a town of some 500 acres, was destroyed by fire which, however, did not attack the adjacent 3200-acre plant of the Du Pont Powder Company, which had been established within a few years at this place, which is 12 miles from Petersburg. These and similar fires gave rise to a somewhat general suspicion that they were the work of incendiaries employed by European governments to harass manufacturers of war material. In few, if any, cases were such claims substantiated, and it was thought in many instances that the ex-

treme speed with which work was being done, the use of new plant and equipment, and inadequate supervision of new workers, were responsible.

Up to November, 1915, 153 school fires were reported, and the most serious of these was at Peabody, Mass., on October 28th, when St. John's Parochial School was burned, and 21 pupils perished. This fire aroused a general consideration of the construction and equipment of school buildings, and added attention was given to fire drills.

A serious fire during the year was that at the factory of the Union Paper Box Company, Pittsburgh, October 25th, when 13 girls and 1 man perished, and 20 others were seriously hurt. This was followed by a fire in Brooklyn, N. Y., at the Diamond Candy Company, Nov. 6, 1915, when 8 employees were suffocated or burned to death, and 4 jumped and were fatally injured, in addition to others injured in other ways. A fire and explosion, in which 55 lives were lost, and \$500,000 worth of property destroyed, took place at Ardmore, Okla., in August, 1915, caused by the explosion of a 250-barrel gasoline car.

There were, as usual, a number of fires during the year involving serious loss of life, but in practically every case these disasters resulted from ignoring plain warnings from earlier and similar catastrophes. Fire engineering and building construction, not to mention plans for the safety of the occupants, had long since reached a stage where the precautions to be observed were clearly indicated and where these were not enforced the responsibility lay with the community rather than with engineers or experts. See also FORESTRY.

STATISTICS OF FIRES. The National Board of Fire Underwriters, through its Committee on Statistics and Origin of Fires, published its usual tables for the leading European and American cities, from which the accompanying information has been compiled.

STATISTICS OF FIRES IN AMERICAN CITIES, 1914

	Area Sq. Mile	Population	No. of Alarms	Total No. of Fires	Confined to Building or Place of Origin	Total Loss	No. of Fires per 1000 Popu- lation	Loss per Capita
New York	314.75	5,698,667	16,245	14,425	14,128	\$8,217,811	2.53	\$1.44
Chicago	194.4	2,450,000	14,977	12,447	11,944	6,018,589	5.08	2.46
Philadelphia	129.5	1,660,000	5,061	4,383	4,240	2,791,130	2.64	1.68
St. Louis	61.37	790,000	4,674	3,808	3,011	2,900,522	4.19	3.42
Boston	47.85	750,000	5,679	4,249	4,221	3,044,627	5.67	4.06
Cleveland	57	660,000	3,096	2,879	...	1,756,863	4.36	2.66
Baltimore	38.67	600,000	2,860	2,261	2,235	704,138	3.77	1.77
Pittsburgh	40.67	565,000	2,160	2,016	1,986	1,750,437	3.57	3.10

FISH AND FISHERIES. The last available report of the United States Commissioner of Fish and Fisheries gave statistics up to June 30, 1914. According to this report the amount and value of fish landed at Boston and Gloucester for the year were as follows:

	Amount in lbs.	Value
Cod	44,864,813	\$1,574,875
Cusk	5,959,286	102,468
Haddock	58,672,665	1,488,356
Hake	14,085,890	291,904
Pollock	15,267,401	261,557
Halibut	5,288,154	459,804
Mackerel	5,676,002	347,068
Herring	11,747,226	218,621
Swordfish	2,380,920	198,877
Miscellaneous	3,274,879	47,487

Of this, 67.52 per cent of the quantity and 65.45 per cent of the value were taken from grounds lying directly off the United States coast. The menhaden fisheries had a value of \$2,269,912 in fish, while the finished products were valued at \$3,690,155. In North Carolina, measures have been taken to allow the spawning shad a free passage up the middle of rivers, and this has resulted in a large increase in the number of eggs taken at the hatching stations. It is expected that there will be a corresponding increase in the number of adult fish. In order to secure a greater supply of lobster eggs, arrangement has been made with Maine fishermen, by which berried lobsters will be given to the bureau in exchange for stripped females. Of recent development is the canning of the long finned tuna of California, and it was estimated that 400,000 cases would be marketed in 1914. According to a newspaper item appearing in October, the 1915 catch of mackerel was the largest on record.

For the year 1914 there was appropriated by Congress to the United States Bureau of Fisheries for salaries, \$391,180, and for the propagation of food fishes, \$350,000. The latest available statistics showed that in 1912 8400 persons were engaged in making buttons and other products from the fresh water mussels, the output being valued at \$8,882,000. The value of the shell was estimated at \$294,600, while incidentally, \$149,000 worth of pearls were collected with the shells. The Bureau is also making especial efforts to encourage the use of mussels for food. The survey work of the Bureau has shown that there are excellent black bass fisheries off the coast at Beaufort, N. C., and large scallop beds extending to within 40 miles of

New York City. The report calls attention to the fact that on many farms there are waste lands which could easily be flooded and stocked with fish, thus adding to the available food supply at comparatively little cost. During the year the Bureau distributed 530,213,575 eggs, 3,494,991,837 fry, and 22,438,005 fingerlings and adults.

The latest complete official compilation regarding Alaskan fisheries is that for the year 1914, when the total products were valued \$21,243,000, exceeding by \$5,500,000 the values for the year 1913. Of the phenomenal catch of 1914, 92 per cent pertained to the salmon alone, in which industry there was invested capital of \$31,894,000, giving employment to 21,200 persons. The 84 salmon canneries sent forth fish valued at \$18,920,000 besides miscellaneous other products than canned valued at \$638,000. The fishery products of 1915 slightly exceeded in value those of any preceding year. Dr. Hugh Smith, Chief United States Fisheries, estimates the total value at \$21,535,992, of which the salmon industry yielded \$18,844,899. Plans for the improvement of fishery conditions are in progress by the United States Bureau of Fisheries, as to hatcheries, methods of fishing, conservation of supply, waste-preventions and refuse-utilizations. Under congressional acts certain waters have been withdrawn from exploitation by fishing industries. In addition on Jan. 1, 1916, there became effective prohibition against salmon fishing in waters tributary to Barnes Lake, Prince Wales Island; Hetta Creek and tributaries; Sockeye Creek and Boca de Quadra hatchery waters. Complications as to Alaskan fisheries are threatened by the bill passed April 22, 1915, by the Alaskan Legislature imposing additional license fees on fisheries, salteries, fish-traps, etc., already taxed by the United States. The bill yet awaits approval by Congress to become a law. See also ALASKA, *Fur Seal*.

Work on economic fish problems was continued in England, though the *International Exploration of the Seas* was stopped by the war. The station at Port Erin reported that in 1914 nearly 9,000,000 plaice were hatched, and about 8,000,000 young were liberated. Out of 24,500 lobster eggs, 1823 young were reared to the fourth stage. The Board of Agriculture and Fisheries began the marking of salmon and sea trout with metal tags, afterwards turning the animals loose, in order to collect data later on their growth, migrations, and general natural history. Further evidence has been collected to demonstrate that

the age of cod can be determined by the rings on the scales and by the concentric rings of the otoliths.

Gardiner pointed out the fact that an abundance of sunshine in the spring, by favoring the growth of diatoms, and thus favoring the growth of copepods, will result in a greater abundance of food for fishes, and thus increase the number of mackerel. It might thus be possible in the spring to form an estimate as to the abundance of fish to be found later. See also ZOOLOGY.

FISHERIES. See section so entitled under various countries and States of the United States.

FISK UNIVERSITY. An institution for higher education of the colored race, founded in 1866 at Nashville, Tenn. The total enrollment in all departments in the autumn of 1915 was 512. The teaching faculty numbered 38, and the officers 13. Mr. Fayette Avery McKenzie was inaugurated president on November 9th. During the year, Dr. C. W. Morrow was appointed dean, instead of acting president; A. G. Shaw was appointed professor of physics; and H. C. Maeder professor of Latin and history. The productive funds of the university amounted at the end of the fiscal year to \$236,810, and the income from investments for that year to \$11,446. The library contained about 11,500 volumes.

FITCH, GEORGE. American writer, died Aug. 9, 1915. He was born in Galva, Ill., in 1877, and graduated from Knox College in 1897. He engaged in newspaper work on several papers in Illinois, and finally joined the staff of the Peoria *Herald-Transcript*. In this paper appeared his first humorous writings which soon gained him wide recognition. His stories of college life, written with much humor, were especially well received. His writings include: *The Big Strike at Sycash* (1909); *At Good Old Sycash* (1911); and *My Demon Motor Boat* (1912). In 1912 Mr. Fitch was elected to the Illinois House of Representatives as a Progressive. At the time of his death, he was president of the American Press Humorists' Association.

FLAX. Data pertaining to the flax crop of the world in 1915 were very incomplete, only a few countries reporting estimates of their yields. Italy reported a production of 2,968,000 bushels of seed, and 5,060,000 pounds of fibre. Holland placed its fibre crop at 10,795,000 pounds. The linseed harvest of British India amounted to a little over 17,000,000 bushels, and the Canadian harvest to 12,604,700 bushels from 1,009,600 acres, the rate of yield being 12.48 bushels per acre. The Canadian flaxseed crop of 1915 was 75 per cent greater than the crop of 1914. The United States produced 13,845,000 bushels on 1,367,000 acres, the average yield per acre being 10.1 bushels. The area was less by about 275,000 acres, but the yield was larger by nearly 100,000 bushels than in 1914. For the five-year period, 1909-13, the average area in flax was 2,490,000 acres, and the average production 19,501,000 bushels. The area devoted to fibre flax in the United States was, as usual, very limited. As pointed out by the Department of Agriculture, fibre flax has been grown with favorable results during recent years in the Puget Sound and the lower Columbia and Willamette River regions, as well as in the territory surrounding the Great Lakes and including Wisconsin, Minnesota, and the valley of the Red River of the

North. The State of Oregon appropriated money for experiments with fibre flax. An equipment for handling and working the flax was installed at the State prison and the convicts were also required to assist in harvesting the crop from the fields. Promising results were obtained and the State secured fibre flax seed of its own growing for distribution.

FLINT, AUSTIN. American alienist, died Sept. 23, 1915. He was born in Northampton, Mass., in 1836, and was educated in private schools in Buffalo, and at Harvard University, where he studied for two years. He afterwards studied medicine at the University of Louisville, and in the Jefferson Medical College, Philadelphia. In 1857 he began to practice in Buffalo, where, from 1857-59, he was also editor of the *Buffalo Medical Journal*. In 1859-59 he was professor of physiology and microscopical anatomy in the medical department of the University of Buffalo. He removed to New York in the latter year, becoming professor of physiology in New York Medical College. After a year spent in New Orleans, he was appointed acting assistant surgeon, United States army, at the General Hospital, in New York City, remaining there until 1865. From 1861 to 1898 he was professor of physiology and microscopical anatomy at the Bellevue Hospital Medical College, of which he was one of the founders. In 1898 he was appointed to the same chair at Cornell University Medical College, becoming several years before his death professor emeritus. He made a specialty of insanity, and was consulting physician in several State hospitals for the insane. His greatest fame among laymen came from his connection with the celebrated Thaw case. His testimony as to the insanity of Harry Thaw was perhaps the strongest factor in preventing the latter's release from the asylum for the criminal insane, following the murder of Stanford White. During the year 1860 he attracted attention for his operations on the spinal cord and nerves of living animals. Many honors were conferred upon him by medical and scientific societies. These included a prize from the French Academy of Science in 1862. He was interested in military matters, and in 1874 was appointed surgeon-general of New York State. He received the degree of LL.D. from Princeton University. He wrote much on medical subjects, including an elaborate revision of the history of the discovery of the motor and sensory properties of the spinal nerve roots. Among his books may be mentioned: *The Physiology of Man* (1866-75); *Text Book of Human Physiology* (1875-88); *Source of Muscular Power* (1878); and *Hand Book of Physiology* (1905).

FLOOD PREVENTION. The disastrous floods of 1913, as well as the perpetual menace to many cities in the Middle West due to the inadequate control of rivers and waterways, during the spring season, led to the consideration of a number of important engineering works. In Indianapolis about 4½ miles of levee were being built along the west bank of the White River, involving an embankment whose water slope was faced with concrete, and had at some places concrete retaining walls. This work in some cases had involved the rectification of the river channel and provided for a considerable increase in width of the channel at high water, so that several bridges would have to be lengthened to give the required waterway. This was an important con-

sideration, as the water channel under many bridges through the Western States was found to be seriously inadequate, due to encroachments on the natural width of the waterway. The top of the levee, which is to be incorporated in the boulevard system of the city, was to be a broad driveway with lawn spaces on each side, the top being from 12 to 17 feet above the original ground level, and 4 feet above the 1913 high water mark. Plans were also being prepared for similar protection along the east bank, while work had been done along Fall Creek. The work was begun in June, 1915, and was to be finished during the year. The contract price was in the neighborhood of \$460,000, and the cost of land acquired for the improvement was about \$655,000. The new work involved modern concrete construction with a well-equipped plant.

In Ohio, preliminary engineering work was completed in the Miami conservancy district, which is a territory including Dayton and Hamilton, and embracing the watershed of the Miami River and its tributaries. The reservoir originally contemplated for Logan County was considered less efficient than was at first supposed, and had to be compensated for at other sites and at a substantial saving in cost. The topographical survey of the district included some 240,000 square miles, which was begun very carefully, and some 12,000 feet of test borings on dam sites were made, so that the general character of the flood protection and prevention works could be determined. Various legal complications were in the way of the prosecution of the work, but it was to be undertaken, as well as approved by the court.

The great damage resulting from floods in the Middle West led to the discussion of many schemes of flood prevention. In view of its hydrographic and other river work, it was urged that flood-prevention on inland rivers might properly be undertaken by the Federal government in coöperation with the localities affected. A clause in the river and harbor bill passed in 1915 provided that the chief of engineers of the United States army might have examinations and surveys made "with a view to devising plans for flood protection and determining the extent to which the United States should coöperate with the States and other communities in carrying out such plans, its share being based upon the value of the protection to navigation." The rivers named are the Cheat, Tygarts, Westport, Kanawha, Muskingum, Scioto, Miami, Maumee, Kankakee, and Wabash.

On August 3rd a serious rain storm, with a rainfall of 10 inches, which culminated in a cloudburst about 7 P. M., produced a disastrous flood at the city of Erie, Pa., with the loss of a score of lives and several millions of dollars in property damaged. Mill Creek, a small stream passing through the centre of the city, rose within two hours to a height of over 6 feet and spread across the principal street of the city—State Street—causing a failure of the foundations of many buildings and their collapse, due to the heavy wreckage which was forced against them. Bridges were also destroyed. The lesson of this flood was brought before the people in such a way that plans were prepared for an improvement of the channel and control of the stream. There was involved the construction of a closed reinforced concrete conduit and also the eliminating of all sharp bends, and the relocat-

ing of about 24,000 feet of the channel of the stream to obtain a shorter and straighter course. There was provision, too, for constructing a concrete-lined open conduit. A dry reservoir was recommended about 1¼ miles above the city line, which would have a capacity of 52,000,000 cubic feet. This reservoir would ordinarily be empty, and would be drained by a culvert large enough to pass any but extraordinary floods. The estimate of the engineer engaged to report to the city stated that the work could be done for \$798,000.

Floods in Los Angeles County during the rainy season have been a source of serious damage and the board of engineers appointed by the supervisors to study the flood control problem reported a project which would cost \$16,208,900, of which \$12,824,400 was for structures, and \$3,384,500 for right of way. This report involved a series of plans including the conservation of the run-off by diversion into the gravels in the headwater district, retardation of the run-off by contour plowing, reforestation and impeding dams, and stream-diversion in the coastal plains. There was recommended a change in the mouth of the Los Angeles River from the harbor at San Pedro to Alamitos Bay. With necessary legislation, which became effective Aug. 10, 1915, it was proposed to push the final preparations and legal steps, so that the work could be put under construction immediately. In 1914 the loss in this district was over \$10,000,000, and the need of suitable protection was brought clearly before the public. See HURRICANES.

FLORIDA. POPULATION. The population of the State, on July 1, 1915, was estimated at 870,802. The population in 1910 was 752,619.

AGRICULTURE. The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1914-15, were as follows:

		Acreage	Prod. Bu.	Value
Corn	1915	800,000	12,000,000	\$8,760,000
	1914	700,000	11,200,000	8,960,000
Oats	1915	61,000	1,220,000	854,000
	1914	50,000	900,000	630,000
Rice	1915	500	12,000	9,000
	1914	400	10,000	7,000
Potatoes	1915	12,000	960,000	1,104,000
	1914	13,000	1,040,000	1,175,000
Hay	1915	51,000	a 61,000	976,000
	1914	48,000	65,000	1,118,000
Tobacco	1915	8,900	b 3,549,000	816,000
	1914	4,800	4,300,000	1,290,000
Cotton	1915	198,000	c 50,000	3,559,000
	1914	221,000	81,000	4,763,000

a Tons. b Pounds. c Bales.

MINERAL PRODUCTION. The only mineral production in the State is phosphate rock. In this it surpasses all the other States. There were marketed in 1914, 2,138,891 long tons of this mineral, which had a value of \$7,354,744, or 78 per cent of the entire production of the United States. As compared with the production of 1913, the output of 1914 shows a decrease of 406,385 long tons. Phosphate rock produced in the State consists of hard rock, land pebble, and river pebble. No river pebble was mined in the State in 1914, but a small amount was sold from De Soto County. The value of the total mineral production in 1914 was \$8,497,638, compared with \$10,508,016 in 1913.

FINANCE. The latest report available for the financial condition of the State is for the fiscal

year ending June 1, 1914. The receipts for the year amounted to \$3,429,784, and the disbursements to \$3,390,685, leaving a balance on hand Dec. 31, 1914, of \$1,522,769, which includes a balance at the beginning of the year of \$1,483,690. The public debt amounted to about \$600,000.

EDUCATION. The total school population of the State in 1915 was 275,310. The enrollment in the public schools was 177,154, and the average daily attendance was 126,565. The female teachers numbered 3208, and the males 1074. The average monthly salary of white male teachers was \$54.02, and of white females \$36.44. The average monthly salary of negro male teachers was \$38.91, and female teachers was \$30.74. The total school expenditure for the year 1914-15 was \$2,769,335. The Legislature of 1915 passed a number of new measures dealing with schools. These dealt chiefly with the methods of administering the finances.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include an asylum for the insane; an institution for wayward boys, known as Florida Industrial School; and a school for the deaf, dumb, and blind. The Legislature of 1915 passed a measure providing for the establishment of an industrial school for girls. There were in 1915 about 1500 State prisoners.

TRANSPORTATION. The total railway mileage in the State in 1914 was 5759. Railways with the longest mileage are: the Seaboard Air Line, Atlantic Coast Line, the Florida East Coast, Louisville and Nashville Line, and the Georgia Southern and Florida.

POLITICS AND GOVERNMENT. The Legislature was in session in 1915. The so-called package law, passed by the Legislature, which forbids drinking intoxicants upon the premises where they are publicly sold, went into effect on August 1st. Under the provision of this measure, liquor may be bought in containers holding not less than half a pint. It further provides that saloons must remain closed from 6 P. M. until 7 A. M. There were no elections in 1915, and but little of political interest transpired.

STATE OFFICERS. Governor, Park M. Trammell; Secretary of State, H. C. Crawford; Treasurer, J. C. Luning; Comptroller, W. V. Knott; Attorney-General, Thomas F. West; Auditor, Ernest Amos; Adjutant-General, J. C. R. Foster; Superintendent of Public Instruction, W. N. Sheats; Commissioner of Agriculture, W. A. McRea—all Democrats.

SUPREME COURT. Chief Justice, R. F. Taylor; Justices, T. M. Shackelford, J. R. Whitfield, R. S. Cockrell, and W. H. Ellis; Clerk, G. T. Whitfield.

STATE LEGISLATURE. Both Houses are Democratic.

FLORIDA, UNIVERSITY OF. A State institution for higher education, founded in 1905, in Gainesville, Fla. The total enrollment in all departments in the autumn of 1915 was 647. The faculty numbered 57. There were no notable changes in the membership of the faculty during the year, and no noteworthy benefactions were received. The university is supported almost entirely by legislative appropriations. The productive funds amount to about \$85,000. The library contains about 15,000 volumes. The president was A. A. Murphree.

FLOTATION. See **METALLURGY.**

FLOUE. See **FOOD AND NUTRITION.**

FLY, HOUSE. See **ENTOMOLOGY**; and **INSECTS, PROPAGATION OF DISEASE BY.**

FOOD AND NUTRITION. **NUTRITION STUDIES.** The steadily advancing cost of living and the continuance of the European war led to many efforts to effect economy in the food supply. In Germany, a "war bread," in which rye flour was supplemented by about 20 per cent of potato flour, was officially recommended, although digestive disturbances from its excessive use were also reported. Blood from slaughter houses and sugar were also being added to bread to conserve the grain supply, and yeast was found to be a very digestible substitute for meat. Attempts to prepare a hay flour from alfalfa and clover, meat flour, food products from wood and straw, and a kind of tea from dried heather were also reported, as well as the direct use as food of sugar beets and lichens.

The United States Department of Agriculture studied the prevention of spoilage and waste, particularly of eggs, fish, and fruit by-products. Many fruit juices were prepared, and their distinctive colors and flavors were retained for many months by storage at about 14° F. After applying pressures of 60,000 pounds per square inch, the West Virginia Experiment Station has kept apple juice, peaches, and pears for five years without spoilage, but was less successful with berries, tomatoes, and vegetables. The California Station prepared a palatable paste from cull olives, and jellies from surplus oranges and lemons. The use of small amounts of feterita, proso, and kaoliang was suggested to replace wheat flour, and slightly sprouted wheat was found to make a bread of fair quality. Attention was drawn by the United States Bureau of Fisheries to the value of tile-fish, a deep sea fish now becoming plentiful after years of scarcity.

Langworthy and Holmes, of the Office of Home Economics, of the United States Department of Agriculture, reported studies showing a digestibility of 97 per cent for butter and lard, 93 per cent for beef fat, and 88 per cent for mutton fat. Osborne, Mendel, et al., concluded that their previous discovery of the failure of lard to promote growth was not attributable to deteriorating changes brought about in its manufacture. Tests by others of the chemically hardened vegetable oils recently put on the market for lard substitutes and other purposes indicated that these products are suitable for human food, but should not be hardened above where the melting point exceeds body temperature.

In studies of proprietary preparations for feeding infants, several investigators reported that many of these foods contain an excess of carbohydrates and a deficiency of fat. Analyses of proprietary brands of crackers, cookies, and similar package goods by the Connecticut State Station indicated that, because of their high cost, their purchase must often be justified through their value as confections rather than simply as foods. At the California Station a high nutritive value was found for the avocado, while the Oregon Station demonstrated the wide variations in value of different sorts of apples for specific cooking purposes.

The intimate relation of food to a number of specific diseases was brought out. The United States Public Health Service obtained symptoms diagnosed as pellagra in several convicts after a restricted diet consisting mainly of corn prod-

ucts, rice, sweet potatoes, and cane sirup. Modifying the diet in orphanages where the disease had been endemic by replacing a part of the carbohydrate food by fresh animal and leguminous protein foods was followed by a cessation of the disease. In other cases the exclusion of sugar and other cane products, which had been eaten in large amounts, resulted in many cures. Beriberi was also ascribed to a diet deficient in some food principle. In Poland, many people who had lived almost wholly on potatoes for several months were found to have developed symptoms of heart disease and dropsy, which disappeared with better nourishment and improved hygienic conditions. Other cases of potato poisoning were attributed to the activities of yeast or bacteria rather than to solanin. Bacteria in duck eggs were claimed to have caused food poisoning, and sterilization by long-continued boiling was advised. Such foods as ice cream and spaghetti were proved to be possible carriers of the typhoid fever bacillus, neither freezing for long periods nor baking destroying its viability. Similarly, studies of carbonated beverages by the Kentucky Station showed that carbonation killed many but not all the organisms, and indicated the great importance of a pure water supply and sanitary methods.

COST OF FOOD. *Bradstreet's* recorded for Dec. 1, 1915, the highest commodity index in its history. This showed an increase of over 17 per cent over the previous year, and 11.5 per cent over the former high-water mark in 1912. Wholesale prices for wheat, corn, flour, ham, butter, cheese, coffee, sugar, tea, salt, rice, beans, peas, potatoes, lemons, mackerel, cranberries, raisins, and currants were still higher than in 1914, but those for live and dressed meats, eggs, milk, and apples were in general lower. Despite the advancing cost of living, however, *Bradstreet's* maintained that "it is worth noting that in 1912 the dearth of commodities worked widespread agitation, whereas just now discontent is negligible."

FOOD INSPECTION. The cases reported for prosecution under the United States Food and Drugs Act numbered 820, of which 325 were criminal cases. There were also 155 cases reported under the meat inspection law, and 6713 importations of food were denied entry.

Connecticut, Hawaii, Michigan, New Jersey, North Carolina, and Oregon were added to the States requiring the net weight of package goods to be shown. Arizona, Massachusetts, and Minnesota required the labeling of cold storage eggs; Connecticut of pasteurized milk; North Carolina of bleached flour; California, Montana, Oregon, and Washington of eggs and dairy products from foreign countries; and Montana and Oregon of meat and meat products as well. Pennsylvania regulated the handling of meat and meat food products, as well as the sanitation of restaurants, etc. Delaware provided for the inspection of fruit and vegetable canneries, and Vermont of creameries and cheese factories. Florida and Missouri required the screening from flies of food producing and handling establishments, and Oregon the licensing of all persons catching, canning, or handling food fish. Massachusetts provided for bread inspection, California further regulated cold storage practices, and Illinois the traffic in spoiled eggs. Nebraska and North Dakota also amended their pure-food laws.

BOOKS OF THE YEAR. The following may be

mentioned: Ruth A. Wardall and Edna N. White, *A Study of Foods* (Boston); Edith H. Forster and Mildred Weigley, *Foods and Sanitation* (Chicago); Mary D. Chambers, *Principles of Food Preparation* (Boston); E. T. and Lilian Brewster, *The Nutrition of a Household* (Boston); Mildred Bulkley, *The Feeding of School Children* (London); and S. Nearing, *Reducing the Cost of Living* (Philadelphia).

FOOT-AND-MOUTH DISEASE. See **VETERINARY MEDICINE**.

FOOTBALL. Rugby football attained its greatest heights in 1915. It is estimated that 32,000 games were played by the various college and school teams throughout the United States, and that these contests drew a total attendance of 6,000,000 persons. The play itself, too, was more spectacular than ever before, this fact being due to the increased familiarity shown with the new rules which place a premium on the open game.

Undoubtedly the strongest eleven of the season was Cornell, which went through its schedule without suffering a defeat. Harvard, Pennsylvania, and Michigan were among the teams which fell before Dr. Al Sharpe's powerful and well balanced aggregation. Harvard deserves second ranking and many experts maintain that at the close of the season the Crimson squad, coached by Percy D. Haughton, was the equal, if not the superior, of Cornell.

Harvard was well satisfied with its record as a whole, despite its defeat by the Ithacans, for the Cambridge men accomplished their two chief tasks, the overthrow of Princeton and Yale. The triumph over the Elis was the most complete ever gained by a Harvard eleven, the score being 41 to 0.

The University of Pittsburgh would naturally dispute Harvard's claim to second place, for this team, like Cornell, went through the season without losing a game. The fact remains, however, that Pittsburgh did not meet elevens possessing the strength exhibited by the Crimson's opponents.

Princeton must receive serious consideration for fourth place, although it lost to Yale, which had been defeated by four so-called "minor" teams in Virginia, Washington and Jefferson, Colgate, and Brown. The ranking of the other college elevens is a hard problem, but closest followers of the sport placed them in this order: Syracuse, Dartmouth, Colgate, Penn State, Washington and Jefferson, Rutgers, Brown, Pennsylvania, and Yale.

Among the individual stars of the year, Charlie Barrett, leader of the Cornell team, and Eddie Mahan, the Harvard captain, were pre-eminent. Other gridiron players of note were: Oliphant, of the Army; Captain Glick, of Princeton; Shiverick, of Cornell; Tallman, of Rutgers; Nash, of Rutgers; King, of Harvard; Miller, of Columbia; Cahall, of Lehigh; and Peck, of Pittsburgh.

In the West the strongest elevens were: Washington State, University of Washington, Oregon Aggies, Michigan Aggies, Illinois, and Minnesota. Vanderbilt and Virginia made the best showing of the Southern teams.

Walter Camp made the following selections for his All-America first team:

Ends, Baston, Minnesota, and Shelton, Cor-

nell; tackles, Gilman, Harvard, and Abell, Colgate; guards, Spears, Dartmouth, and Schlachter, Syracuse; centre, Peck, Pittsburgh; quarterback, Barrett, Cornell; halfbacks, King, Harvard, and Macomber, Illinois; fullback, Mahan, Harvard.

A summary of the games played by the leading college teams follows:

Cornell 13, Gettysburg 0; Cornell 34, Oberlin 7; Cornell 46, Williams 6; Cornell 41, Bucknell 0; Cornell 10, Harvard 0; Cornell 45, Virginia P. I. 0; Cornell 34, Michigan 7; Cornell 40, Washington and Lee 21; Cornell 24, Pennsylvania 9.

Harvard 39, Colby 6; Harvard 7, Massachusetts Aggies 0; Harvard 29, Carlisle 7; Harvard 9, Virginia 0; Harvard 0, Cornell 10; Harvard 13, Penn State 0; Harvard 10, Princeton 6; Harvard 16, Brown 7; Harvard 41, Yale 0.

University of Pittsburgh 32, Westminster 0; Pittsburgh 47, United States Naval Academy 12; Pittsburgh 45, Carlisle 0; Pittsburgh 14, Pennsylvania 7; Pittsburgh 42, Allegheny 7; Pittsburgh 19, Washington and Jefferson 0; Pittsburgh 28, Carnegie Tech. 0; Pittsburgh 20, Penn State 0.

Princeton 13, Georgetown 0; Princeton 10, Rutgers 0; Princeton 3, Syracuse 0; Princeton 40, Lafayette 3; Princeton 30, Dartmouth 7; Princeton 27, Williams 0; Princeton 6, Harvard 10; Princeton 7, Yale 13.

Syracuse 43, East Syracuse 0; Syracuse 6, Bucknell 0; Syracuse 0, Princeton 3; Syracuse 82, Rochester 0; Syracuse 6, Brown 0; Syracuse 14, Michigan 7; Syracuse 73, Mount Union 0; Syracuse 38, Colgate 0; Syracuse 0, Dartmouth 0.

Dartmouth 13, Massachusetts Aggies 0; Dartmouth 34, Maine 0; Dartmouth 20, Tufts 7; Dartmouth 60, Vermont 0; Dartmouth 7, Princeton 30; Dartmouth 20, Amherst 0; Dartmouth 7, Pennsylvania 3; Dartmouth 29, Bates 0; Dartmouth 0, Syracuse 0.

Colgate 44, Susquehanna 0; Colgate 44, Rochester 0; Colgate 13, West Point 0; Colgate 107, Rensselaer Poly. 0; Colgate 15, Yale 0; Colgate 0, Syracuse 38.

Penn State 26, Westminster 0; Penn State 14, Lebanon 0; Penn State 13, Pennsylvania 3; Penn State 27, Gettysburg 12; Penn State 28, West Virginia 0; Penn State 0, Harvard 13; Penn State 7, Lehigh 0; Penn State 33, Lafayette 3; Penn State 0, Pittsburgh 20.

Washington and Jefferson 6, Geneva 0; Washington and Jefferson 6, West Virginia 6; Washington and Jefferson 17, Lafayette 0; Washington and Jefferson 34, Westminster 0; Washington and Jefferson 16, Yale 7; Washington and Jefferson 41, Muskingum 7; Washington and Jefferson 0, Pittsburgh 19; Washington and Jefferson 7, West Virginia 3; Washington and Jefferson 59, Bethany 0; Washington and Jefferson 27, Lehigh 3.

Rutgers 53, Albright 0; Rutgers 0, Princeton 10; Rutgers 96, Rensselaer 0; Rutgers 21, Muhlenberg 0; Rutgers 41, Springfield Y. M. C. A. College 13; Rutgers 28, All Stars 7; Rutgers 39, Stevens 3; Rutgers 70, New York University 0.

Association football, or soccer, gained many recruits during the year 1915. The National Challenge Trophy, emblematic of the championship of the United States Football Association, was won by the Bethlehem Club, the final match being played on Taylor Field, Lehigh University,

with the Brooklyn Celtics as the opponents of the new champions. The score was 3 to 1.

The Celtics made an excellent showing as they also were finalists in the cup tie of the American Football Association, which was won by the Scottish-Americans of Newark, N. J. The Celtics were more successful in the New York State series, capturing the championship for the third successive year.

The West Hudsons won the championship of the National League, and the United Hudsons carried off the honors in the Metropolitan League. The intercollegiate soccer title went to Haverford, after a spirited race in which Pennsylvania was the chief contender.

In England the principal series were contested despite the fact that many of the leading players answered the call to the colors.

FORESTRY. The year 1915 promised to be a bad year for forest fires. Many thousand acres of forest and suburban woodland in the Eastern United States and in Canada were burned over during the early spring by fires which started for the most part from preventable causes. Rains during the latter part of April helped the situation somewhat, and reports from different parts of the country since that time indicated that the damage from forest fires for the year as a whole would be much less than for many years past. The successful results of the Federal fire protective system on the National Forests was yearly inducing more States to take up the work of forest protection. The estimated loss from forest fires in the Dominion of Canada for 1915 was \$10,000,000. Formerly the railroads were the principal offenders in starting fires. During the year 1915, however, the majority of the losses resulted from settlers' fires, there being no serious loss along the lines of railroad governed by the Dominion Board of Railway Commissioners and their forest protective regulations.

At least 80 lots of imported white pine infected with white-pine blister rust had been located in the United States and Canada during the previous five years. Most of these infections had been eradicated, but from eight of them outbreaks of the disease in native pines occurred. The largest of these outbreaks recently developed along the Niagara River in Ontario, fortunately, however, in an isolated region. In the United States the eastern white pine (*Pinus strobus*) was, in 1915, the only one affected. In Europe, however, the disease attacked other five-needle pines, and consequently the five-needle pines of the Western States were endangered.

The importation of European pine to the United States was prohibited after July 1, 1915. This action was taken to save American pine trees from the pine shoot moth which had long done much damage in European forests. The Canadian government prohibited the importation into Canada of all forest plant products from Maine, Massachusetts, New Hampshire, Connecticut, and Rhode Island, unless accompanied by a

certificate of the United States Department of Agriculture showing them free from gypsy moth.

THE NATIONAL FOREST SERVICE. On March 31, 1915, there were 162 National Forests in the United States, with a total area of 184,611,596 acres, of which 21,337,533 acres were private land. During the previous five years about 14,000,000 acres had been released either for agricultural purposes or because they were unsuited for permanent forest purposes. Some recent eliminations for the latter cause included 5,802,000 acres, or nearly one-half of the Chugach Forest in Alaska, and the Kansas National Forest in the Sand Hill region of Western Kansas. About 1,900,000 acres were made available under the Forest Homestead Law for the benefit of 18,000 settlers. The total receipts from the National Forests during the year ended June 30, 1915, approximated \$2,500,000, of which amount over \$850,000 went to the States in which the forests are situated for county school and road purposes.

With the close of the fiscal year ended June 30, 1914, appropriations for purchase under the Weeks Law (see FORESTRY in YEAR BOOK for 1912) of lands for protecting watersheds of navigable streams terminated. Of the \$11,000,000 appropriated for this purpose to be expended during the fiscal years 1910 to 1915 \$3,000,000 lapsed before contracts of purchase could be completed. With the remaining \$8,000,000 the National Forest Reservation Commission approved the purchase of lands in 16 localities of the Southern Appalachian and White Mountains, involving a total area of 1,317,551 acres. This was acquired or bargained for at an average price of \$5.22 per acre. In 1914 the Commission recommended that purchases be continued until about 6,000,000 acres are acquired, and that Congress authorize appropriations through another five-year period at the rate of \$2,000,000 a year. In his report to the President, the secretary of agriculture recommended that purchases should continue until areas sufficient to be influential in protecting the watersheds are acquired.

LEGISLATION. In order to encourage the use of National Forest land for recreational purposes—summer homes, resorts, etc.—Congress passed a law in March authorizing the secretary of agriculture to lease lands in tracts of not more than five acres for periods not to exceed 30 years. More than 2000 cottages had been built under the old permit system and a large number of applications under the new leasing system had been received.

Massachusetts passed a law carrying an appropriation of \$75,000, empowering the State forester to employ needy persons on the State forests in the work of forest protection and development. Working under the Municipal Forest Law, Fitchburg, Mass., set aside 105 acres of land to be known and used as a Town Forest. New Hampshire provided for the conveyance of lands to the State for reforestation. After 10 years the lands can be repurchased by paying the cost of improvements and 4 per cent interest. In Vermont, cities and towns were authorized to buy lands for forestry purposes, the profits to be used for the schools of each place. The State forester is to manage tracts of over 40 acres. In Pennsylvania, counties are permitted to sell tax lands for reforestation through the State forest service. Texas provided for a State Board of Forestry and a State forester. The Governor may

accept for the State gifts of lands for forest reserves and similar lands may be purchased. West Virginia created the position of State forester in the Department of the Forest, Game, and Fish Warden. State cut-over lands in Washington that are suitable for reforestation may be perpetually reserved, reforested, and handled as State forests.

ALASKAN TIMBER RESERVE. A timber reserve approximately 200 miles in length and from 5 to 10 miles in width, was established by presidential order on the public lands north of the Chugach National Forest. The purpose of the reservation was to prevent the timber needed for the construction of the government railroad from falling into the possession of individuals or corporations. Only the timber on the land, not the land itself, has been reserved.

FOREIGN COUNTRIES. With the continuance of the great war forest activities in Europe were almost at a standstill, except that many trained foresters and many valuable forests were sacrificed in the conflict. American foresters were pleased to learn that Dr. C. A. Schenk, former director of Biltmore Forest School, who was seriously wounded in battle in France, did not die as reported last year but recovered after a long convalescence.

The International Colonial Institute at Brussels issued a symposium in three volumes dealing with the forest laws and forest administration in the colonies of Great Britain, Holland, Germany, Italy, and France, the Philippines, Hawaii, Porto Rico, etc. The subject matter was prepared by various authorities.

Russia in 1915 occupied first place among the nations of the world in the extent of its timber resources. The forests in European Russia covered an area of 474,000,000 acres; in Finland, 50,500,000 acres; in Poland, 6,700,000 acres; and in the Caucasus, 18,600,000 acres; a total of 549,800,000 acres, exclusive of Siberia. The Russian Forestry Department placed the total timberland in Siberia at 810,000,000 acres, of which two-thirds could be successfully placed on the market. The government owned 285,598,941 acres of forest land in European Russia, 12,826,387 acres in the Caucasus, 360,519,435 acres in Asiatic Russia, and 288,742,000 acres in the Amur region, a total of 947,686,763 acres. Twenty-three per cent of the forest land belonged to landed proprietors and 9 per cent to the peasantry in 1910.

As the results of experiments carried out by a Swedish expert it was ascertained that *Araucaria imbricata*, a tree which abounds in Argentina and Chile, provided excellent raw material for wood pulp, better even in quality than that usually employed in making paper pulp in both Europe and the United States. Three and one-half average trees suffice to produce one ton of pulp. Two and one-half trees will produce one ton of news print paper.

A survey of Ireland's timber resources showed that of the total area of the country only 297,809 acres, or 1.4 per cent, was under woods. The rates of cutting and planting during the previous 10 years showed a deficiency of 4341 acres in the planted area necessary to maintain a permanently stocked acreage of woodland.

The director of the Philippine Bureau of Forestry who recently returned from a trip to China in the interests of Philippine lumber, reported that there was a market for all the lumber pro-

duced in the islands if the dealers could receive a guaranty of a constant supply.

The Venezuelan government recently created a Central Commission of Forestry and Water Supplies to fulfill the duties indicated by its name.

The year 1915 witnessed the development of a growing reforestation movement in China. The University of Nanking opened a school of forestry in March with an enrollment of 17 students. The event was commemorated by ceremonial tree planting on Purple Mountain, near Nanking. Three scholarships in the school were provided by the forestry fund committee of Shanghai.

FORMAN, JUSTUS MILES. American writer, died May 7, 1915. He was born in Le Roy, N. Y., in 1875, and graduated from Yale in 1898. For three years he studied art at Paris. His talent was more for literature than for art, however, and he took to authorship, writing stories profusely for the magazines, and also many novels. Among his books are *The Garden of Lies* (1902); *The Journey's End* (1903); *Jason* (1909); *The Unknown Lady* (1911); *The Open Door* (1913); and *The Blind Spot* (1915). He was the author also of several successful plays. Mr. Forman was a victim of the sinking of the *Lusitania*. See DRAMA, AMERICAN AND ENGLISH.

FORMOSA, or TAIWAN. An island dependency of Japan off the coast of the Chinese Province of Fukien. The capital is Dai-Hoku (or Taipei). Formosa Island has an area of 2318.5 square ri; the seven adjacent isles, 5.6 square ri; total, 2324.1 square ri (13,841 square miles). The estimated population at the end of 1914 was 3,612,184; at the end of 1912, 3,476,679 (1,825,518 males, 1,651,161 females), of whom the indigenes numbered 3,335,957; Japanese, 122,793; and foreigners, 17,929. Estimated population of the larger towns Dec. 31, 1911: Dai-Hoku (consisting of Jonai, Moko, and Daitote), 95,077; Dainan (or Tainan), 59,601; Kaga (or Chia-i), 22,418; Rokko (or Lukong), 19,153; Kiilung (or Keelung), 17,962; Shinchiku (or Hsinchu), 16,294; Gilan (or Ilan), 16,062; Shokwa (or Changhua), 15,545; Taku (or Takow), 13,775; Daichiu (or Taichu), 12,788.

Japan acquired Formosa from China by cession in 1895 and instituted civil government in the following year. Many improvements have

been made, including the establishment of an educational system.

The agricultural products include rice and other cereals, tea, sugar, sweet potatoes, jute, and hemp. By far the most important crop is rice, which was planted to 485,213 cho in 1912 (1 cho = 2.45 acres); the yield was 4,046,611 koku (1 koku = about 1.804 hectoliters, or 4.963 English bushels). In 1912 cattle numbered 446,587; goats, 126,270; and swine, 1,276,607. The forest area of Formosa is reported at 2,862,712 cho. An important forest product is camphor, which is worked as a government monopoly. The mineral output in 1912 was valued at 4,302,969 yen, as compared with 2,266,292 in 1907; gold produced in 1912 was valued at 2,136,660 yen; copper, 1,031,460; oil, 892,136; and silver, 132,416. The value of fishery produce in 1912 is stated at 992,737 yen. Manufactures include flour, sugar, spirits, tobacco, oil, soap, etc. The figures below represent, in yen, imports and exports from and to foreign countries and from and to Japan (including Korea, etc.).

	Imports		Exports	
	Foreign	Japan	Foreign	Japan
1908	11,009,464	11,194,788	11,078,321	9,729,459
1911	19,555,047	83,739,556	13,175,590	51,648,586
1912	19,307,126	48,825,290	14,960,228	47,831,451
1913	18,023,724	42,835,593	12,942,442	40,446,620

The larger classified imports and exports (including both foreign and Japanese, but excluding the small trade with Korea) were as follows in 1913: rice, other cereals, etc., 5,885,843 and 16,010,567 yen respectively; other foodstuffs, together with beverages and tobacco, 13,256,303 and 23,878,561; drugs, colors, etc., 6,511,275 and 8,252,501; cotton yarn, fabrics, etc., 7,720,661 and 724,824; minerals, pottery, metal goods, etc., 3,076,709 and 2,963,182. Imports from and exports to China in 1912, 6767 and 4264 thousand yen; United Kingdom, 3490 and 1087; British India, 2173 and 342; United States, 1700 and 4917; Germany, 1072 and 1573. Reported length of state and private railway open in 1913 (including light railways on sugar estates), 690 miles.

Revenue and expenditure in 1912-13, 60,295,858 and 47,188,576 yen respectively; the budget for 1913-14 balanced at 47,525,015 yen; for 1914-15, 48,337,133. Formosa is administered by a Governor-General (Lt. Gen. Count Sakuma Samata), resident at Dai-Hoku.

FORSYTH, GEORGE ALEXANDER. American soldier, died Sept. 12, 1915. He was born in Muncy, Pa., in 1837, and received an academic education. He enlisted as a private in the Chicago Dragoons in 1861; in the same year became first lieutenant in the eighth Illinois cavalry; was promoted to be captain in 1862, and major in 1863; and in 1866 was mustered out of the volunteer service, and into the regular army as major in the ninth United States cavalry. He was appointed to be lieutenant-colonel of cavalry in 1881, and was retired from service in 1890. In 1904 he was advanced by an act of Congress to the rank of colonel. He received a brevet as colonel of volunteers in 1864 for gallant and meritorious service at Winchester, and was brevetted brigadier-general of the volunteers in 1865 for distinguished service and conspicuous gallantry. General Forsyth fought during the entire war in

the army of the Potomac. He took part in 16 battles, 6 skirmishes, and over 60 minor engagements. He was four times wounded. From 1869-73 he acted as military secretary to Lieutenant-General Sheridan, and was an aid to Sheridan from 1878-81. He achieved much distinction as an Indian fighter, and his celebrated battle with "Old Roman Nose" and 2000 Cheyenne warriors on the Republic River in Kansas was one of the most thrilling engagements in Indian warfare. The Indians held General Forsyth and his small band at bay for two and one-half days on a sand bar in the river. "Old Roman Nose" and many of the Indians were killed, and all of the white men were either killed or wounded. General Forsyth took part as a staff official in Sheridan's famous ride from Winchester to Cedar Creek. He wrote *Thrilling Days in Army Life* and *The Story of the Soldier*, both published in 1900.

FORSYTH, JOHN MCQUEEN. Admiral, retired, of the United States navy, died Aug. 3, 1915. He was born in the Bahamas in 1842, and at the age of 11 removed to the United States, settling with his family in Philadelphia. He graduated from the Central High School of that city in 1858, and in the same year went to sea before the mast. Three years later he enlisted as a volunteer in the navy, and in 1861 was appointed acting master's mate. He served throughout the Civil War, in the South Atlantic and West Gulf squadrons; took part in the capture of Forts Clarke and Hatteras, in 1861; and was with Admiral Farragut in the naval fights on the Mississippi. He was in the engagement with the Confederate ram *Arkansas*. Promoted to be lieutenant in 1868, he became commander in 1899, and captain in the following year. His last sea duty was in command of the battleship *Indiana*, to which he was assigned in August, 1901. In September, 1901, he was retired, at his own request, and with the rank of rear-admiral.

FORTIFICATIONS. See MILITARY PROGRESS.

FORWOOD, WILLIAM HENRY. American soldier, died May 11, 1915. He was born in Brandywine Hundred, Del., in 1838, and graduated from Crozier Academy in 1856, afterward studying medicine at the University of Pennsylvania. In 1861 he was appointed assistant surgeon in the United States army, and served throughout the Civil War. At its close he was promoted to be captain and assistant surgeon, and rose through the several ranks until he was appointed in 1902 brigadier-general and surgeon-general. He received two brevets for gallantry during the Civil War. He served also in the Indian campaigns, and was surgeon and naturalist in Sheridan's exploring expeditions in 1880-82. In 1898 he built the Montauk Hospital. He retired from active service in 1902. He was for many years professor of surgical pathology in the Georgetown Medical College, and he was also professor of medical surgery at the Army Medical School. He was a member of many medical and scientific societies, and wrote much on medical subjects and on natural history in periodicals.

FOSDICK, CHARLES AUSTIN. American writer, whose pen name was "Harry Castleman," died Aug. 22, 1915. He was born in Randolph, N. Y., in 1842, and received a high school education in Buffalo. At the outbreak of the Civil

War he shipped as landsman in the Mississippi squadron. He passed through all intermediate classes, and at the end of the war was receiver and superintendent of the coal of the squadron. Practically all the remainder of his life was given to writing stories for boys. Many of his books embodied his experiences during the Civil War. He was one of the most popular of American writers of juvenile stories. Among his numerous books are: *The Boy Trapper*; *Buried Treasure*; *Sailor Jack, the Trader*; *The Houseboat Boys*; *The Pony Express Rider*; and *The White Beaver*.

FOURTH OF JULY INJURIES. The *Journal of the American Medical Association* compiled its 13th annual report of deaths and injuries resulting from the celebration of the Fourth of July. In the 13 years a total of 43,951 persons were killed or injured in the celebration. The total of 1915 showed a gratifying improvement over previous years, except in a few localities. There was only one death from lockjaw, although 294 blank cartridge wounds were reported. The decrease in tetanus is believed to be due to the general and prompt use of antitoxin. In all there were 30 deaths from fireworks injuries; 5 persons were killed by firearms; 5 by explosions of powder, bombs, or torpedoes; 6 by cannon; and 2 by other forms of fireworks. Eleven persons, mostly little girls or small children, were burned to death. Of non-fatal injuries there were 1135. One person was totally blinded, 11 lost one eye each, 5 lost legs, arms, or hands, and 38 lost one or more fingers. The large cities showing the greatest number of accidental injuries are: Philadelphia, with 1 killed and 280 injured; New York, 272 injured; St. Louis, 47 injured; Boston and Hartford, Conn., 27 casualties each; while Chicago had only 8 casualties, but 5 of these fatal. See TETANUS.

FOWLER, THOMAS POWELL. American railway officer, died Oct. 12, 1915. He was born in Newburgh, N. Y., in 1851, and was educated at Columbia and at Heidelberg universities. He practiced law for several years in New York City with great success. In 1886 he was president of the New York, Ontario, and Western Railroad; and he was interested in other railroads and in various financial institutions.

FOX, JOSEPH JOHN. Roman Catholic bishop, died March 15, 1915. He was born in Green Bay, Wis., in 1855, and was graduated at the Cathedral School at Green Bay, at St. Francis Seminary, Milwaukee, and at the University of Louvain. From the last named institution he received the degree of D.D. in 1879. In the same year he was ordained a priest. His first pastoral work was at New Franken, Wis. He was afterwards for three years in charge of St. John's Church, Green Bay. In 1896 he was appointed vicar-general of the diocese of Green Bay, serving until 1904; and in 1898 domestic prelate to Pope Leo XIII. He was appointed bishop of Green Bay in 1904.

FRANCE. A republic in western Europe. Capital, Paris.

AREA AND POPULATION. The area is stated at 53,646,374 hectares, equivalent to 536,464 square kilometers, or 207,129 square miles. The table following gives, by departments, areas in square kilometers, legal population according to the censuses of 1911 and 1906, and density in 1911.

Some of the principal cities, with their communal population in 1911, are as follows: Paris, 2,888,110 (1,053,262 in 1851); Marseilles, 550,619; Lyons, 523,796; Bordeaux, 261,678; Lille, 217,807; Nantes, 170,535; Toulouse, 149,576; Saint-Etienne, 148,656; Nice, 142,940; Le Havre, 136,159; Rouen, 124,987; Roubaix, 122,723; Nancy, 119,949; Reims, 115,178; Toulon, 104,582; Amiens, 93,207; Limoges, 92,181; Brest, 90,540; Angers, 83,786; Tourcoing, 82,644; Nîmes, 80,437; Montpellier, 80,230; Rennes, 79,372; Grenoble, 77,438; Dijon, 76,874; Tours, 73,398; Calais, 73,322; Orléans, 72,096; Saint-Denis, 71,759; Le Mans, 69,361; Levallois-Perret, 68,703; Clermont-Ferrand, 65,386; Versailles, 60,458; Besançon, 57,978; Boulogne-sur-Seine, 57,027; Saint-Quentin, 55,571; Troyes, 55,486; Boulogne, 53,128; Béziers, 51,042; Avignon, 49,304; Lorient, 49,039; Caen, 46,934; Clichy, 46,676; Bourges, 45,735; Neuilly-sur-Seine, 44,616; Cherbourg, 43,731; Montreuil, 43,217; Asnières, 42,583; Villeurbanne, 42,526; Saint-Ouen, 41,904; Poitiers, 41,242; Perpignan, 39,510; Belfort, 39,371; Dunkerque, 38,891; Vincennes, 38,568; Ivry, 38,307; Saint-Nazaire, 38,267; Angoulême, 38,211; Courbevoie, 38,138; Aubervilliers, 37,558; Pau, 37,149; Roanne, 36,697; La Rochelle, 36,371; Pantin, 36,359; Douai, 36,314; Le Creusot, 35,587; Rochefort, 35,019.

EDUCATION. In 1911 the conscription list carried 301,467 men of the class of 1910. Degree of instruction of 18,093 of these, unknown. Of the other 283,374, 2.79 per cent could neither read nor write, 1.31 per cent could read only, 27.44 per cent could read and write, 65.98 per cent had acquired a more extensive primary education, and 2.30 per cent were graduates of secondary institutions. In 1913 the conscription list carried 309,580 men of the class of 1912, of whom 2.48 per cent could neither read nor write, 1.37 could read only, 28.76 could read and write, 54.76 had received other primary instruction, 2.57 were graduates, 2.17 had received degrees, and 7.89 remained unclassified.

Infant schools (1912-13), 3868 (2660 public and 1208 private lay schools), with 8410 teachers and 583,074 pupils. Primary schools, including superior primary schools, 81,489, with 156,189 teachers, and 5,508,534 pupils. State expenditure for primary instruction during the year 1912, 225,477,137 francs.

Secondary public schools (1912-13): 343 lycées and colleges for boys (100,203 students), and 139 for girls (33,282); 55 secondary courses for girls (5076 pupils). Students in universities, Jan. 15, 1914, 42,037.

AGRICULTURE. Of the productive area (1909), 23,615,220 hectares were under crops (including sown meadows), 4,837,610 under natural meadows, 1,577,220 under forage plants, 3,627,330 un-

der pasture, 1,686,942 under vines, 1,220,150 under industrial plants, truck gardens, etc., 9,329,193 under woods and forests; 3,843,520 hectares were fallow or uncultivated; 3,218,579 not included in any of the foregoing. As calculated in 1912: 23,747,220 hectares cropped, 4,898,510 meadows, 1,572,440 forage plants, 3,613,290 pasture, 1,624,213 vines, 251,560 industrial plants, etc., 1,098,450 various and uncultivated, 2,615,705 not included in foregoing—a total of 52,952,579 hectares.

A table of cereal crops follows—year 1912, area sown in hectares, yield by measure in hectolitres and by weight in metric quintals, and value in thousands of francs:

	Ha.	Hctle.	Qs.	1000 fr.
Wheat	6,571,580	118,505,800	90,991,500	2,523,289
Maize	128,750	2,120,260	1,554,620	87,101
Rye	1,201,630	17,228,900	12,382,200	280,010
Barley	759,630	17,295,400	44,014,200	216,499
Buckw't	461,280	7,888,320	5,006,940	112,350
Oats	2,981,980	110,531,900	51,451,600	1,091,979
Corn	476,480	8,222,070	6,028,680	144,749
Millet	21,170	227,785	154,555	

The following table gives provisional figures for 1914-15, and final figures for 1913-14 for area under main crops in hectares, total yield in quintals, and quintals yielded per hectare in 1913-14. These figures are exclusive of territory invaded by the enemy.

	Hectares		Quintals		Qs.
	1914-15	1913-14	1914-15	1913-14	Ha.
Wheat	5,691,771	6,138,060	64,720,200	78,703,210	12.8
Rye	1,029,565	1,080,370	9,928,200	11,888,260	10.5
Barley	692,758	740,961	7,862,750	10,044,930	18.6
Oats	8,419,955	8,681,869	87,462,200	46,654,720	12.7
Corn	810,113	461,920			
Potatoes	1,802,561	1,479,690		140,000,000	
Sugar beets	84,318	195,433			
Vines*	1,637,218	1,653,599		59,981,492	

* Production in hectolitres of wine.

In the invaded area were 275,000 hectares under wheat in 1915, 24,000 under rye, 19,700 under barley, 243,000 under oats, 4238 under vines (1914).

In 1912, 33,133 hectograms of silk-worm eggs were placed to be hatched, against 35,431 hectograms in 1911. The cocoons obtained amounted to 6,233,942 kilograms, against 5,109,426 in 1911. Average yield of cocoons per hectogram of eggs, 188.1 kilograms (144.2 in 1911). Live stock statistics follow (Dec. 31, 1910 and 1913; July 1, 1915).

	1910	1913	1915
Horses	3,197,720	3,280,700	2,227,209
Mules	192,740	192,570	152,266
Donkeys	860,710	860,890	837,244
Cattle	14,532,080	14,807,380	12,286,849
Sheep	17,110,760	16,213,030	13,483,189
Goats	1,417,710	1,453,230	469,487
Swine	6,900,280	7,047,750	5,490,796

Of the horses enumerated Dec. 31, 1913, 2,558,170 were over and 672,530 were under three years (July 1, 1915, 1,562,742 and 664,467); of the cattle, 7,807,560 were cows (6,346,496), 1,845,620 oxen (1,262,315), 284,490 bulls (211,343), 2,855,780 young stock (2,581,870), and 2,013,930 calves (1,884,825). Of the sheep, 9,334,840 were ewes over one year (8,033,886), 2,589,000 sheep over one year (1,572,236), 295,410 rams (239,832), 3,993,780 lambs (3,637,235); pigs under six months numbered 3,294,

010 (3,041,053); fat stock over six months, 2,808,230 (1,632,252), sows, 960,000 (785,989).

MINING AND METALS. In 1912 there were 1459 conceded mines, covering an area of 1,166,353 hectares, of which 496, covering an area of 596,262 hectares, were in operation. In these mines 236,966 persons were employed—168,358 underground, 68,608 at the surface. Total estimated number of work days, 67,991,633; total estimated wages, 358,001,473 francs. Total output, 62,284,573 tons, valued at 775,403,262 francs at the pit's mouth. The quarries employed 134,087 work people; output, 53,279,845 tons, valued at 293,623,038 francs. In the table below are shown some of the principal mining products, with their value in francs, for comparative years:

	Tons		Francs	
	1911	1912	1911	1912
Coal	38,520,827	40,394,177	589,219,277	631,427,608
Lignite	708,764	751,001	7,229,739	8,001,683
Iron*	16,639,426	18,423,752	77,462,085	89,387,275
Peat	58,521	42,714	785,674	512,716
Salt	1,339,303	1,098,515	18,826,599	15,850,245
Gold*	143,514	165,880	7,588,080	9,574,000
Zinc ore	43,761	45,929	5,159,005	5,148,000
Iron pyrites	277,942	282,002	4,696,685	4,766,000
Argent. lead	14,098	13,953	2,612,959	3,790,000
Antimony	29,267	11,018	1,596,668	599,000
Asphalt	35,568	31,535	566,688	491,869
Manganese	6,036	5,576	169,564	178,000

* Ore.

Employed in metal works in 1912 were 5870 workpeople; output, 4,939,194 tons. Smelting works, 13,312 workpeople; 524,907 tons. Steel works, 72,653 workpeople; 3,250,278 tons.

FISHERIES. There were in 1911, 137,057 persons engaged in the various fisheries, with 28,885 vessels of 247,634 aggregate tons.

In 1910 there were 128,869 fishermen, with 28,288 sail boats of 206,129 aggregate tons, and 454 steamers of 38,000 tons; value of sail boats, 51,933,057 francs; of steamers, 23,945,330; value of the engines, 25,309,360. Total value of all fisheries products for the year 1910, 140,288,211 francs. The total value of the products was 139,568,367 francs, of which the Newfoundland cod fisheries contributed 19,015,063 francs, the herring fisheries 13,243,466, and the sardine fisheries 11,311,615.

COMMERCE. Imports for four years are given below by great classes (special trade), values in thousands of francs (A—foodstuffs, B—raw materials, C—manufactured articles):

Imports:	1910	1911	1912	1913
A	1,413,031	1,989,832	1,803,400	1,916,500
B	4,345,871	4,638,979	4,813,200	4,941,600
C	1,414,630	1,531,856	1,614,200	1,650,300
Total	7,173,332	8,160,667	8,230,800	8,508,400

Exports appear in the following table, by great classes as above, with the addition of D (by parcel post), values in thousands of francs:

Exports:	1910	1911	1912	1913
A	858,199	725,240	849,800	838,200
B	1,930,847	1,919,170	1,944,900	1,882,700
C	2,960,951	3,039,761	3,917,900	4,159,500
D	483,808	487,906		
Total .	6,238,805	6,172,077	6,712,600	6,875,400

The figures for the 1913 special trade are subject to slight revision. The general commerce for 1912 shows imports valued at 10,293,600,000 francs, exports valued at 8,823,900,000 francs. An English source gives the 1914 trade as follows: £253,960,000 imports and £179,120,000 exports (exclusive of £13,880,000 by parcel post).

The table below shows important articles in the special trade for successive years, values in millions of francs:

Imports:	1908	1909	1910	1912	1913	1914
Wool	533.1	634.4	658.9	684.6	698.8	526.1

By presidential decree dated July 31, 1914, the export of all kinds of food flour has been prohibited from the day when the decree was communicated to the prefects. By presidential decree dated October 18th, the export of cotton and cotton waste has been prohibited from October 19th. Exceptions to these orders may, however, be granted.

By an order of Aug. 22, 1915, raw cotton was declared contraband of war.

SHIPPING. The number of ships, French and foreign, with their aggregate tonnage, entered and cleared, exclusive of coasting, during the years 1911 and 1912 are given herewith.

	1911		1912	
	No.	Tons	No.	Tons
Entered:				
French	7,690	7,138,790	8,093	7,581,374
Foreign	20,493	22,728,220	21,793	23,721,433
Total	28,183	29,867,010	29,886	31,302,807
Cleared:				
French	6,946	6,623,511	8,288	7,763,518
Foreign	13,860	15,931,835	21,766	23,709,449
Total	20,806	22,555,346	30,004	31,472,968

Merchant marine, Jan. 1, 1913: 15,813 sailing vessels, of 614,024 tons; 1857 steamers, of 904,494—total, 17,670 vessels, of 1,518,518 tons.

COMMUNICATIONS. There were reported in operation Dec. 31, 1913, 40,786 kilometers of main railway lines, and 10,645 of local lines. At the end of 1910 there were in operation 40,484 kilometers of main railway lines, 234 of industrial lines, and 8956 of local lines; making a total of 49,628 kilometers, besides 8687 kilometers of tramways. The main lines had a personnel of 339,032, and rolling stock including 12,840 locomotives and 379,181 cars. Receipts from main lines (1910), 1,829,942,000 francs; expenditure, 1,098,802,000; net profit, 731,140,000; net kilometer profit, 18,060. Length of main lines in operation in 1911, 40,635 kilometers; in 1912, 40,854. Length of local lines in operation in 1911, 9321; in 1912, 9925.

During 1915 the railways of France, except in the territory actually the scene of military operations, were restored somewhat to their normal conditions. The railway systems, both state and private, passed through the trials of the earlier stages of the war with considerable credit, notwithstanding the fact that the military organization of the French lines was in no way comparable to that of Germany. The French railroads performed a wonderful service, and were essential elements of the successful retreat and operations attending the battle of the Marne in 1914. Reports of their activity in the first months of the war, published in 1915, revealed the fact that from Aug. 1 to Aug. 20, 1914, no less than 1,800,000 men were taken to the front, and each of these soldiers was handled three times, so that in reality 5,400,000 troops were delivered at various points along the battle line. In addition, it was estimated that some 5,000,000 of the civilian population were also traveling, and that two armies were being hurried into Alsace and Lorraine. After the first two weeks of the war, except in the actual zones of fighting, the regular schedules for regular passengers and commercial freight practically were resumed, and were carried on in addition to the movement of large numbers of troops and war material, on

a battle front 584 miles long from the English Channel to the Swiss frontier. When it is recalled that the rolling stock was constantly decreasing, as well as the coal supply, and a smaller number of railroad men were available, the importance of the work may be appreciated.

France contains six large railway systems—two controlled by the state, and four by private corporations—the latter comprising 30,000 of the 36,000 miles of single track, and it was by these private companies that much of the work was done during the war. In addition to the mobilizing of the troops in the early part of the war, there was the transport of tourists, and on Aug. 1, 1914, the time tables on every one of the six systems of France were changed to a new schedule. One of the most notable incidents of the war was the transportation of 70,000 Indian troops from Marseilles in three days, from the south of France to the vicinity of Orleans, whence they proceeded to support the English at Nieuport-Dixmont. The French railways at first suffered from the effects of mobilization as in some cases employees were withdrawn, but gradually this trouble became adjusted, and in many instances the wives of railroad men called to the colors took their husbands' places.

The Eastern Railroad (chemin de fer de l'Est), with the single exception of the Northern Railroad (chemin de fer du Nord), suffered more physical and financial disaster than any other of the French roads, because of the German lines. At least half of the 500-mile line of trenches beginning at Laon was in the territory adjacent to the tracks of the Eastern Railroad, which was in consequence seriously crippled. On that half of its system which brought in the greatest revenue, it could do no business at all, and it was thought it would be many months after the cessation of hostilities before it could rebuild its burned stations, restore dynamited bridges, repair its roadbed, etc.

Likewise the Northern Railway (chemin de fer du Nord) suffered severely, as much of its territory was in the enemy's hands. At the beginning of September, 1914, only 414 miles, or 18 per cent of the total network of 2324 miles, was actually being operated by the company. At the end of 1915, the company was operating a total length of about 1200 miles, or 51.5 per cent of the entire system. Of the 768 stations on the system, 346 were either occupied by the enemy or closed to traffic. Not all the remaining 412 stations were open to the public, a certain number being exclusively reserved for military uses. For over a year the Nord was deprived of the use of most of its main lines, and the only double-track main line available at the end of 1915 was that from Paris to Creil, Amiens, Boulogne, Calais, and Hazebrouck.

In 1912 there were 190,111 kilometers of telegraph lines, and 710,557 of wires; state telegraph stations, 18,707; railway and private stations, 3577. There were 51,750 kilometers of urban telephone lines, with 1,135,953 of wires; and 108,447 kilometers of interurban lines, with 571,405 of wires. Post offices, 14,634. Postal receipts for the year 1912, 390,942,960 francs; expenditure (posts and telegraphs), 353,028,874 francs. Telegraphic receipts (including wireless), 49,347,920 francs. Telephone receipts, 56,649,228 francs.

FINANCE. The monetary unit is the franc, par

value 19.295 cents. The 1912 budget, as voted, estimated the revenue for the year at 4,495,849,566 francs (including revenue returnable from Algeria, 2,480,900 francs); the expenditure at 4,497,963,139 francs. Sources of revenue: 3,136,996,425 from taxes; 953,225,785 from monopolies and state industrial enterprises; 68,218,850 from state domains; 69,441,485 from divers sources (indemnities, repayments, annuities, sales, prison labor, etc.); 153,000,000 from special sources; 114,967,021 *recettes d'ordre* (from colonial railways, fines, fees, etc.); 2,480,900 from Algeria. Expenditure: 1,286,084,002 for the public debt, 19,972,948 for public services, 2,539,705,705 for the ministries, 605,873,584 for costs of administration and collection of taxes, 46,326,900 for reimbursement, restitution, etc.

Actual revenue and expenditure are given below in francs for three years:

	1910	1911	1912
Revenue . . .	4,273,890,789	4,689,045,845	4,857,491,193
Expend. . .	4,321,918,609	4,547,915,741	4,742,756,094

The details of the budget for 1914 are given below in thousands of francs:

Revenue	1914	Revenue	1914
Direct taxes . . .	607,485	Monopolies	1,004,858
Other direct . . .	68,037	Sundries	753,085
Indirect	2,940,050		
		Total	5,373,517

Expenditure	1914	Expenditure	1914
Public debt	1,318,324	Instruction	843,882
Government	19,859	Fine arts	21,816
Finance	379,839	Commerce, etc.	16,470
Justice	61,523	Labor, etc.	112,122
Foreign affairs	20,943	Posts and Tels.	857,786
Interior	177,421	Colonies	110,918
War	1,436,491	Agriculture	57,999
Marine	489,124	Public works	352,822
Merchant marine	96,032		
		Total	5,373,329

The special-services budget balanced at 816,329,331 francs for 1913. The total general debt, Jan. 1, 1913, stood at 31,449,083,037; floating debt, Oct. 1, 1913, 1,432,412,800; grand total, 32,881,495,837.

ARMY. See **MILITARY PROGRESS**, *passim*.

NAVY. On Dec. 1, 1912, the number and displacement of warships, built and building, of 1500 or more tons, and of torpedo craft of more than 50 tons, were as follows: 7 battleships (dreadnought type), having a main battery of all big guns (11 inches or over in calibre), of 161,644 aggregate tons—all building; 20 battleships (predreadnought type), with main batteries of more than one calibre, of 286,005 tons—built; 2 coast-defense vessels (smaller battleships and monitors), of 15,400 tons—built; 10 cruisers (designed for speed at some expense of armament and armor protection), of 49,978—built; 75 torpedo-boat destroyers, of 29,816 tons—built, and 9, of 6860 tons—building; 157 torpedo boats, of 15,370 tons—built; 76 submarines, of 27,803 tons—built, and 13, of 7456—building. Total vessels built, 361, of 630,769 tons; building, 29, of 175,960 tons—in all, 390 vessels of 806,729 tons. Excluded from the foregoing are ships over 20 years old, unless reconstructed and rearmed within 5 years; torpedo craft over 15 years old; transports, colliers, repair ships, torpedo depot ships, or other auxiliaries. Personnel, 60,188 officers and men.

Number and displacement (built), July 1,

1914: 4 battleships (dreadnought type), of 92,368 tons (and 8, of 193,656 tons estimated, building); 18 battleships (predreadnought type), of 262,675 tons; 1 coast-defense vessel of 8800 tons; 20 armored cruisers, of 201,724 tons; 9 cruisers (unarmored warships of more than 1500 tons), of 46,095 tons; 84 torpedo-boat destroyers, of 35,812 tons (and 3 of 2563 tons, building); 135 torpedo boats, of 13,426; and 64 submarines, of 27,940 tons (and 22, of 14,766 tons, building). Total number of vessels built, 335, of 688,840 aggregate tons; building, 33, of 211,075 tons—a total of vessels built and building, 368, of 899,915 tons. The total strength of the personnel, including reserves, was about 180,000, one-third being active-service ratings. The general efficiency increased noticeably from 1904 to 1914. The main squadrons were concentrated in the Mediterranean under the command of Admiral Boué de Lapeyrère. The armored-cruiser fleet included the *Edgar Quinet* and the *Waldeck Rousseau*, completed in 1911, and having a displacement of 13,900 tons, and an armament of 14 7.6-inch guns. The submarine service is highly efficient, the vessels composing it being remarkable for their heavy armament. Air craft, April 7, 1913, included 13 military dirigibles on hand and 7 ordered; and 450 military aëroplanes on hand, including monoplanes, biplanes, and hydroaëroplanes.

A bill passed Feb. 13, 1912, by the Chamber of Deputies, provided for a home fleet to consist of 28 battleships divided into 4 squadrons each and 4 vessels in reserve; in addition, each squadron to include 2 second cruisers and 12 destroyers, with 2 cruisers and 4 destroyers in reserve. The fleet for foreign service was to contain 10 principal vessels with the necessary auxiliaries. There were to be 94 vessels, together with mine-layers and mine-raisers, in the submarine flotilla. To complete this programme by the time fixed (Jan. 1, 1919), 16 new battleships were to be constructed at the rate of two a year (1910-17). Dreadnoughts laid down in 1913 were the *Flandres*, *Gascogne*, *Languedoc*, *Normandie*, and *Béarn* (the latter 1914). These ships are to displace 25,800 tons and be armed with 12 13.4-inch and 24 5.5-inch guns. The three battleships launched in 1913 are the *Lorraine*, *Bretagne*, and *Provence*, having a displacement of 23,177 tons and armed with 10 13.4-inch and 22 5.5-inch guns. The *Jean Bart* and the *Courbet* were completed in 1913, having a displacement of 23,096 tons, and being armed with 12 12-inch and 22 5.5-inch guns. The *Paris* and the *France* were completed in 1914. The *Vendée* was to have been laid down early in 1915. See also NAVAL PROGRESS.

GOVERNMENT. Under the present constitution, the President is the executive, assisted by a cabinet responsible to the Chamber. The legislative power is vested in a Parliament, or National Assembly, composed of a Senate and a Chamber of Deputies. The President elected by the National Assembly by an absolute majority of votes for seven years, chooses his own cabinet, ordinarily, but not of necessity, selected from among the members of the two chambers. The Senate is made up of 300 members aged not less than 40 years, and elected by delegates for nine years; the Chamber of Deputies is made up of members elected by direct popular vote for four years, 1 to every 70,000 inhabitants. The president from 1906 to 1913 was Clément-Armand Fallières; he

was succeeded Jan. 7, 1913, by Raymond Poincaré, born 1858.

HISTORY

OPENING OF THE PARLIAMENTARY SESSION. After five terrible months of the war, the French people and the French government showed no sign of weakening in their steadfast determination to fight on until the German invader had been expelled and the lost Provinces of Alsace-Lorraine regained. Although events had proved that the war would be long and victory costly, the same grim "will to conquer" which had been expressed in August, 1914, prevailed in France at the beginning of the new year. President Poincaré, in a New Year's address, confidently affirmed that France would never rest until victory was won; he even ventured to predict that the war would be pressed to a successful conclusion before the close of the year 1915. The establishment of civil government, Jan. 1, 1915, in the portion of Upper Alsace occupied by the French was another manifestation of the same spirit of optimism. When the Chamber of Deputies and the Senate assembled for the legislative session of 1915, new proof was afforded of the patriotic unanimity of the nation's representatives. The Socialists, who had hitherto made it a practice to nominate a separate list of candidates for the presiding officers of the Chamber, decided in January, 1915, to abandon their custom and to unite with the other groups in re-electing, by an almost unanimous vote, M. Paul Deschanel as president of the Chamber of Deputies. M. Antonin Dubost was re-elected as president of the Senate. In their inaugural addresses, both presiding officers praised the *union sacrée*, the willingness of all parties to forget their political antagonisms and to work for the triumph of France. The tasks incumbent upon the National Legislature in war-time were admirably summed up by M. Deschanel. The Chambers, he said, must strive "to aid those who are at the front as well as the families left behind; to repair damage done by the invader; to collaborate, according to the measure of their authority, in the work of defense; and to join with the nation and the government in attempting to achieve the expulsion of the enemy, the deliverance of the heroic country (Belgium) which by an act unique in history sacrificed itself to honor, and the restitution of those provinces which force has wrenched from us. At the same time, we must, during the war, prepare for the works of peace; beginning to-day we must establish the elements of to-morrow's economic régime—customs, transports, mines, credit, industry—and of national reconstitution; we must lay the basis for the new France, more fraternal and more prosperous than before."

FINANCIAL QUESTIONS. Old political controversies being for the time forgotten, the Chamber of Deputies during the spring concerned itself chiefly with special measures for the relief of suffering caused by the war, for the regulation of industry, and the conservation of the nation's economic resources during war-time, and for the provision of funds for the energetic prosecution of the war. French industry had been crippled by the German occupation of very important industrial areas; business was conducted under abnormal conditions, as the moratorium had been prolonged; nevertheless France had not only to defray her own enormous expenses in the war,

THÉOPHILE DELCASSÉ
Minister of Foreign Affairs, 1914-October 13, 1915

ARISTIDE BRIAND
Premier and Minister of Foreign Affairs from October 29, 1915

GENERAL GALLIENI
Minister of War

RENÉ VIVIANI
Premier until October 28, 1915, thereafter Minister of Justice

FOUR FRENCH STATESMEN

but also to make joint loans with Great Britain to Serbia, Belgium, Greece, and Montenegro. The expenditures during the first months of 1915, according to a statement made by M. Alexandre Ribot (minister of finance) on March 18th, amounted to almost 1,300,000,000 francs a month. The Bank of France had been called upon in 1914 to furnish 3,600,000,000 francs, and in 1915, thus far, 1,000,000,000. The amount raised by public subscriptions in 1914 was only 1,200,000,000; in less than three months in 1915, a sum more than twice as great had been raised. Altogether the national defense bonds had produced 3,862,000,000 francs up to March 12.

MINIMUM WAGE FOR THE SWEATED TRADES. The miserable conditions usually prevalent in the sweated trades were aggravated by the war, since many poor women, whose husbands had been sent to the front, found it necessary to earn their own livelihood and swelled the number of underpaid workers in the clothing trades. To remedy this evil, the Chamber of Deputies passed a bill modifying the Labor Code and establishing the principle of a minimum wage for certain categories of women workers. According to the statement of M. Jean Morel, who made a remarkable report on the bill in the Senate, the minimum wage regulation would affect about a million women wage-earners, many of whom had been receiving less than 20 centimes an hour for their labor.

THE DESCLAUX GRAFT CASE. In March a profound sensation was created by the Desclaux trial. Instances of dishonesty on the part of officials and contractors in connection with the provision of supplies for the army were probably no more numerous in France than in other countries, but in France such cases aroused public indignation to a greater degree, because among the swindlers who defrauded the government were men who had recently held important administrative positions under the Radical-Socialist government. The most conspicuous offender was a former paymaster-general of the French army, François Desclaux, who had been identified with the Radical-Socialist faction and had been chief secretary to M. Joseph Caillaux during the latter's term of office as finance minister, in 1914 (see *YEAR BOOK for 1914, FRANCE, Murder of M. Calmette*, p. 269). In January, 1915, M. Desclaux was arrested on the charge of stealing army supplies. Mme. Bechoff, a prominent Parisian dressmaker, was implicated in the case, and quantities of the stolen goods—coffee, tents, shells, and helmets—were found in her home. Two months later, M. Desclaux and Mme. Bechoff were convicted after trial by court-martial, M. Desclaux receiving a sentence of seven years' solitary confinement; Mme. Bechoff, two years' imprisonment; and a soldier-accomplice, M. Verges, one year. Desclaux appealed from the decision of the court-martial, but was unable to secure an acquittal, and was degraded from his military rank, August 2nd. The Desclaux case was by no means an isolated incident. In December the fact was revealed that M. Thierry, under-secretary of war, had been a director of a firm, La Morue Française, which had sold a quantity of chemically-preserved codfish to the government at an outrageous price. Many other cases of corrupt dealing in the provision of war supplies were exposed by M. Simyan, in a speech before the Chamber of Deputies, December 14th.

ATTACKS ON THE WAR MINISTRY. During the

summer a few deputies and certain Parisian journals vigorously assailed the administration of the war department. In the Chamber, June 24th, a Radical-Socialist deputy, M. Léon Accambray, violently censured the minister of war, M. Millerand, for having failed to prevent or correct grave defects in the manufacture of shells and in the organization of the sanitary service. Again, on August 5th, after a most eloquently patriotic speech had been delivered by M. Deschanel, M. Accambray attempted to voice virulent criticism of the minister of war. M. Accambray on this occasion obviously failed to gain the sympathy of the Chamber, the overwhelming majority of which was keyed to the highest pitch of patriotic enthusiasm by the reading of President Poincaré's message. The army, said M. Poincaré, realized that "on the victory of France and the Allies rests the future of civilization and humanity. . . . Those who fall die without fear, since by their death France lives and will live forever. . . . In the error of its arrogance, Germany has represented France as light, impressionable, unstable, and incapable of perseverance and tenacity. The people and the army of France will continue to controvert this calumnious judgment by their calm conduct." The storm of criticism had not yet blown over, however. M. Clemenceau, writing in his journal, *L'Homme enchaîné*, continued to discover flaws in the war department. In the Chamber of Deputies, August 13th, M. Brizon vehemently praised General Sarrail, who had been recently removed from his important command in France and transferred to the distant Dardanelles. General Sarrail, it may be noted, was regarded as a possible successor to General Joffre and was praised by Radicals and Socialists as a better "republican" than the commander-in-chief. In reply to the criticisms which had been directed both against himself and, by implication, against the generalissimo, M. Millerand intervened, August 20th, in the debate on an appropriation for the payment of two additional under-secretaries of war, and declared: "For a week certain deputies have conducted here a trial of the war minister. According to them my administration has been characterized by negligence, inertia, and carelessness; I am a prisoner in my own office; I have abdicated in favor of the military authorities and am an enemy of parliamentary control." M. Millerand admitted frankly that the sanitary service at the outset had been faulty; but he asserted that the defects had been remedied, that the supply of munitions had been accelerated in a most satisfactory manner, and that the commander-in-chief enjoyed the complete confidence and admiration of the government, the army, and the nation. The Chamber then adjourned to August 26th. During the short recess, a petition was presented by notable publicists in favor of a modification of the censorship of the press; among the signers of the petition were Gabriel Hanotaux, Stephen Pichon, the editors of the *Temps*, of the *Journal des débats*, of the *Figaro*, and of the *Gaulois*, and M. Georges Clemenceau, whose criticism of the government was mentioned in a foregoing sentence. The test of the government's strength came in the sitting of August 26. Many observers expected the Chamber of Deputies to insist upon the creation of a secret committee to investigate the conduct of the war department. M. Accambray repeated his attacks on M. Millerand. But the president

of the council, M. Viviani, defended the government in a stirring speech, and the Chamber of Deputies with only one dissenting voice granted the credits for which the government had asked. The Chamber was thereupon adjourned to September 16.

THE COST OF THE WAR. Finance monopolized the attention of the Chamber in September. The budget for the remaining three months of 1915, as drafted by Finance Minister Ribot, contemplated an expenditure of 6,240,000,000 francs. Russia, M. Ribot declared, was spending 1,800,000,000 francs a month; Germany, 2,500,000,000 francs; and Great Britain, an even larger sum; whereas the average monthly expenditure of France would amount to less than 2,100,000,000 francs. The three-months' appropriation was quickly passed by the Chamber of Deputies and received the approval of the Senate, September 28th, making the total of appropriations since Aug. 1, 1914, more than 28,000,000,000 francs.

DELCASSÉ'S RESIGNATION. The failure of the Allies' diplomacy in the Balkans, culminating in the Austro-German-Bulgarian invasion of Serbia (consult **WAR OF THE NATIONS**), entailed as one of its consequences the resignation of the French foreign minister and the overthrow of the Viviani cabinet. M. Viviani's explanation of the Balkan situation was published in the French papers, October 13th. That night M. Delcassé, the foreign minister, sent a letter to M. Viviani, announcing his resignation. The following morning, M. Viviani called a special meeting of the council of ministers and explained that M. Delcassé, who had previously asked to be relieved of his arduous ministerial duties, on the ground of ill-health, now insisted upon resigning, since he could not agree with the government on the question of aiding Serbia. In the afternoon of October 14th, the president of the council informed the Chamber of Deputies that the foreign minister had resigned, but denied that any divergence of opinion had manifested itself between M. Delcassé and the other members of the cabinet. Further information regarding the government's plans for the relief of Serbia were insistently demanded by M. Painlevé, who dwelt with great emphasis on the importance of preventing the Germans from opening up the road to Constantinople, and practically demanded that the government reveal the size of the forces sent to Saloniki. M. Viviani, however, would vouchsafe no other information, and limited himself to asserting that in sending the force to Saloniki, the government had taken care not to weaken the front in France. M. Renaudel, a Socialist, reproached the government for its slowness of action and demanded a secret committee to investigate the matter. M. Viviani announced that he would regard the vote on this question as an indication of the Chamber's confidence in the government. The demand for a secret committee was then rejected by 303 to 190, and a vote of confidence was passed, after a tumultuous discussion, by a majority of 372-9. More than 150 deputies abstained from the vote, as an indication of their lack of confidence in the cabinet. Since he could no longer command the unanimous confidence of the Chamber, M. Viviani tendered his resignation to President Poincaré, October 29th.

THE BRIAND CABINET. A new cabinet was formed by M. Briand, October 29th; its membership, as announced October 31st, was as fol-

lows: President of the council and minister of foreign affairs, M. Aristide Briand (not inscribed in any of the groups of the Chamber, but leader of the Federated Parties of the Left: consult the **YEAR BOOK** for 1914, p. 269); ministers of state, without portfolio—M. de Freycinet (Senate, independent), M. Léon Bourgeois (Senate, Democratic Union), M. Emile Combes (Senate, Democratic Union), M. Jules Guesde (Unified Socialist), M. Denys Cochin (Right); justice, M. René Viviani (Republican-Socialist); war, General Galliéni; navy, Admiral Lacaze; finance, M. Ribot (Senate, Republican Union); interior, M. Malvy (Radical-Socialist); public instruction and fine arts, M. Painlevé (Republican-Socialist); commerce, M. Clémentel (Radical Left); agriculture, M. Jules Méline (Republican Left, Senate); public works, M. Marcel Sembat (Unified Socialist); labor, M. Albert Métin (Radical-Socialist); colonies, M. Doumergue (Senate, Democratic Union). M. Jules Cambon, as delegate of the minister of foreign affairs, was an important auxiliary of the new cabinet. It is interesting to note, furthermore, that since the outbreak of the war, under-secretaryships for munitions, sanitary service, aviation, and intendance had been created in the war department; the new posts were filled by M. Albert Thomas (Unified Socialist), M. Joseph Thierry (Democratic Union), M. Justin Godart (Radical-Socialist), and M. René Bernard (Radical-Socialist), respectively. The most important features of the Briand cabinet were: first, the inclusion of a representative of the Right, M. Denys Cochin; second, the fact that eight of the new ministers—MM. Briand, de Freycinet, Bourgeois, Combes, Méline, Ribot, Doumergue, and Viviani—were former presidents of the council; third, that the fighting departments, the navy and the army, were placed in charge of professional warriors, Admiral Lacaze assuming control of the navy, and General Galliéni, who had rendered brilliant service as military governor of Paris, superseding the much-criticised Millerand in the ministry of war. On November 3rd, M. Briand made his declaration of policy before the Chamber of Deputies. He promised to improve the censorship; he assured the Chamber that the government would communicate to it all the information to which the Chamber was entitled; he declared that France and her Allies would not abandon "heroic" Serbia; and he warned the enemies of France that they could not expect "either weariness or exhaustion" on the part of France. As for the terms of peace, he declared, "when the territory of France shall have been wrested from the invader, when the peoples who have been martyred for us, among whom Serbia must be included, have been restored integrally to their rights, then there will be a question of peace." A Socialist, M. Pierre Renaudel, attempted to heckle the new government, demanding a secret committee to investigate the conduct of the war, and inquiring why Socialist papers were excluded from the trenches. M. Renaudel created a lively sensation, and evoked some vehement protests when he insisted that France should repudiate all ideas of acquiring new territory by the war, and asserted that the consciousness that they were not fighting for territorial conquests was a moral asset to the French army. The debate on the declaration of policy was wound up by the president of the council with an eloquent appeal for unanim-

ity. By 515 votes to 1 the Chamber of Deputies signified its confidence in the cabinet; 25 deputies, notwithstanding M. Briand's appeal, abstained from the vote.

POLITICS AND THE HIGH COMMAND. In course of the year a number of generals in the French army were superseded by younger men, and a few very important transfers and new appointments were made. The popular General Sarrail, for example, was transferred from his command in France to the Dardanelles. Admiral Dartige du Fournet replaced Vice-Admiral Boué de Lapeyrière in command of the naval forces. A still more significant change, however, occurred in December. On December 2nd a decree was issued entrusting General Joffre, who had hitherto been in command only of the armies in France, with the supreme command of all French military forces, excepting those in the colonies and in northern Africa. The purpose of the appointment, explained General Gallieni, was to secure "unity of direction" in the prosecution of the war. Some critics interpreted the decree as a triumph for General Joffre, who would now be able to control and supervise the French operations in the Dardanelles and in Serbia as well as in France. M. Georges Clemenceau, however, in his *L'Homme enchaîné*, and M. Gustave Hervé, in *La Guerre sociale*, hinted that General Joffre was being honored with a nominal promotion, in order that the actual direction of the campaign in France might be given to another. On December 9th M. Emile Constant in the Chamber of Deputies questioned the government in regard to the high command. When M. Briand refused to take the Chamber into his confidence in the matter, M. Charles Chaumet declared: "It seems that you have taken too literally the witty paradox of M. Marcel Sembat, 'give us a king or give us peace.' It has appeared to you that there was some incompatibility between democracy and the state of war. We are persuaded, for our part, that the strength of democracy is to remain true to its principles." In the vote that concluded the interpellation, M. Briand was upheld by a majority of 443 to 98. Two days later an announcement was made which seemed, in some measure, to justify the predictions of M. Clemenceau and M. Hervé. Gen. de Currières de Castelnau was appointed to the newly created post of chief of the general staff. General de Castelnau had brilliantly commanded the second army in Lorraine during the earliest stage of the war; subsequently he had been placed in command, first of the army of the Somme, and then of the group of armies in the centre of the French battle line; it was he who had directed the French offensive movement in the Champagne region during September and October, 1915. See **WAR OF THE NATIONS**.

FINANCE. In the middle of December the Chamber of Deputies and the Senate were called upon to vote credits sufficient to cover the estimated expenditures for the first three months of 1916. Minister of Finance Ribot made the statement that France was spending approximately 2,100,000,000 francs a month, as compared with 1,500,000,000 francs in the first months of the war. According to the calculations of the appropriations committee of the Chamber, the total expenditures of France from Aug. 1, 1914, to Dec. 31, 1915, amounted to 31,024,000,000 francs. More than three-fourths of this sum, or 24,347,000,000 francs, had been disbursed for purely

military expenditures. The loans which had been issued to supply the stupendous sums needed for the war had been received by the French public in a highly satisfactory manner; General Joffre had urged his soldiers to persuade their friends and relatives to invest in the "loan of victory"; and the offices opened to receive subscriptions to the loan had been thronged by patriotic investors.

THE CLASS OF 1917. The determination of the French government to utilize every resource, hesitating at no sacrifice of money or of men, until victory was assured, found new expression at the close of the year 1915, when the ministry introduced a bill into the Chamber of Deputies providing for the immediate enlistment of 400,000 recruits who, under normal circumstances, would not have been called to the colors until 1917. Certain deputies, notably MM. Turmel and Auriol, demanded that before authorizing the government to call out the class of 1917, the Chamber should appoint a committee to investigate the utilization of the resources already at the government's disposal, or that at least the government should inform the Chamber of the number of recruits already incorporated in the army. A minority of 112 deputies supported this demand, but the majority upheld the government. In the course of the ensuing discussion, Lieutenant-Colonel Driant, reporter of the bill, assured the Chamber that the health of the young recruits would be carefully protected; that their barracks would be new, clean, and amply ventilated; that they would receive an extra supply of bread and meat and hot soup, besides wine, with their rations. M. Driant demanded, and obtained, one concession from the government, that the date for the enlistment of the new class be postponed from Dec. 15, 1915, to Jan. 5, 1916, in order to permit the youths to spend their Christmas holidays at home. General Gallieni, the war minister, informed the Chamber that although it was deemed necessary to call up the class of 1917, the boys would not necessarily be used in the trenches for some time to come. "I am asking you to call up the class of 1917," he said; "it is necessary that this class of recruits shall be prepared for the moment when the intensive production of armaments and of munitions, together with the reinforcement of the battle-line with new masses of men, may permit new and decisive efforts." Responding loyally to General Gallieni's appeal, the Chamber passed the bill unanimously. In the Senate the bill was passed on December 27th.

FREEMAN, HENRY BLANCHARD. American soldier, died Oct. 15, 1915. He was born in Mount Vernon, Ohio, in 1837. At the age of 18 he enlisted in the tenth United States infantry, in which regiment he was a first sergeant at the outbreak of the Civil War. A few months later he was promoted to the rank of second lieutenant, and shortly after, captain. He was brevetted for gallantry in the battle of Murfreesboro and later received the same honor as major in the battle of Chickamauga, where he was

taken prisoner and sent to Libby Prison. He escaped, but was recaptured, and escaped a second time. He was among several prisoners who tunneled their way out of this prison. After the close of the Civil War he took part in many campaigns against the Indians. Among these was the Sioux War of 1867-68. He was in the campaign in which General Custer lost his life. In 1870 he assisted in subduing the Ute Indians in Colorado. He took part in the Spanish-American War, as colonel of the twenty-fourth infantry; was made brigadier-general in 1901; and in the following year was retired under the age limitation. He received the Congressional Medal of Honor in 1894 for gallantry in the battle of Stone River. His last active service was in Cuba and in the Philippines.

FRENCH, SIR JOHN DENTON PINKSTONE (1852—). A British soldier, born at Ripple Vale, Ripple, Kent. From 1866 to 1870 he was a naval cadet and midshipman in the royal navy. He entered the army in 1874; served during the Sudan campaign (1884-85). From 1893 to 1894 he was assistant adjutant-general of cavalry, and from 1895 to 1897 was assistant adjutant-general at army headquarters. He was appointed major-general in command of the cavalry division in Natal in 1899. In 1900 he became lieutenant-general (local) of the cavalry division in South Africa. He commanded the cavalry in the operations terminating in the relief of Kimberley (February, 1900), and in the operations leading to the capture of Bloemfontein and Pretoria. He was promoted to be lieutenant-general and was appointed to the command of the 1st army corps at Aldershot. He became general in 1907, was inspector-general of home forces in 1907-11, and was made field-marshal in 1913. In March, 1914, during the controversy between Asquith's cabinet and the army over the army's service in Ulster, French resigned, but upon the outbreak of the great war later in the year he reentered the army and commanded the expeditionary force in France. In December, 1915, he was succeeded by Sir Douglas Haig (q.v.). He was made commander-in-chief of the home forces and was elevated to the peerage. See **WAR OF THE NATIONS**.

FRENCH ACADEMY. See **ACADEMY, FRENCH**.

FRENCH CONGO. Now French Equatorial Africa (q.v.).

FRENCH EQUATORIAL AFRICA (formerly French Congo). A French possession in equatorial Africa, on the west coast, composed of the Gabun Colony (capital, Libreville), the Middle Congo Colony (Brazzaville), and the Ubangi-Shari-Chad Colony (Bangui). From the old area of 669,280 square miles must be deducted, roughly, 170,270 square miles ceded under the convention of Nov. 14, 1911, to Germany by France; and to it must be added about 6450 square miles ceded to France by Germany from the Kamerun. The area ceded to Germany carries a population of about 1,000,000 out of the original 10,000,000 (the estimated population in 1906). These estimates of population are probably much too high. The products and export are rubber, ivory, timber, palm kernels and oil, cacao, etc. Gold, copper, and iron are mined. Imports (1913), 21,181,678 francs; exports, 36,665,037 (11,119,319 and 17,453,933 in 1909). Revenue and expenditure balanced (1911) at 15,263,000. Debt (Jan. 1, 1912), 14,-

784,215 francs. French Equatorial Africa is under a Governor-General resident at Brazzaville.

FRENCH ESTABLISHMENTS IN OCEANIA. A French colony in the South Pacific, consisting of widely scattered groups and single islands. Area (estimated), 3998 square kilometers; population, 31,477. Capital, Papeete (3617 inhabitants), in Tahiti. Imports and exports (1913), 9,030,474 and 11,554,507 francs respectively (5,659,367 and 6,031,289 francs in 1910). The principal exports are copra and vanilla.

FRENCH GUIANA (CAYENNE). A French colony and penal settlement on the northern coast of South America. It covers 88,240 square kilometers (34,069 square miles) and had a population in 1911 of about 49,000. Cayenne, the chief town and only seaport, has about 13,500 inhabitants. Gold-mining (placer) is the chief occupation of the people. Imports and exports in 1913 were valued at 12,494,765 and 12,222,537 francs respectively (12,233,000 and 11,567,000 francs in 1910). Of the value of the exports, about five-sixths is gold.

FRENCH GUINEA. A French West African colony. Capital, Konakry, with 6623 inhabitants; Kankan is the chief commercial centre. Other towns are Boké, Kindia, and Dubreka. The railway from Konakry to Kouroussa (588 kilometers) was completed and in operation Jan. 1, 1911. A branch to Kankan was to have been completed in 1914. Transport from and into the interior is by caravan, the best porters being Soussous and Malinkés. The route from Konakry to the Niger, known as the Leprince route, is via Kindia, Timbo, and Kouroussa. Rubber is the principal export, and is gathered over all the colony; but the principal sources are the Futa-Jallon, the Farana region, and certain circles of Upper Guinea. Rice is grown, and grazing is widely practiced. The mineral resources are believed to be considerable. See **FRENCH WEST AFRICA**.

FRENCH INDIA. Five French dependencies in India, covering 513 square kilometers, with 277,723 inhabitants in 1906 and 282,472 in 1911. Density per square kilometer (1906), 541.4. The towns are Pondicherry (the capital), Karikal, Mahé, Chandernagor, and Yanaon. The imports and exports (1913) were valued at 10,837,115 and 43,720,095 francs respectively (8,351,443 and 37,466,013 francs in 1910). Chief exports, oil seeds, raw cotton, and pulse. Railway from Pondicherry to Villapuram and Peralam to Karakal, 30 kilometers.

FRENCH INDO-CHINA. A dependency of France in southeastern Asia, made up of five states and a strip of territory leased from China, as follows:

	Sq. kms.	Pop. 1911	Pop. 1906
Annam	159,890	5,542,822	5,513,681
Cambodia	175,450	1,487,948	1,193,584
Cochin-China ...	56,965	3,050,785	2,870,514
Laos	290,000	631,839	5,896,510
Tongking	119,750	6,117,954	663,727
Kwangchow-Wan*	1,000	158,881	177,097
Total	†803,055	16,990,229	16,815,063

* Leased territory. † 810,060 square miles.

Hanoi (in Tongking) is the capital, with (1911) 113,676 inhabitants; Cholon had 191,665; Bin-Dinh, 75,000; Saigon, 72,000; Pnom-

Penh, 54,621; Hué, 65,000; Vien-tiane and Haiphong, each 27,000.

Trade statistics are returned for the colony as a whole, and are given below in francs:

	1909	1911	1913
Imports	249,753,877	244,143,000	306,288,068
Exports	273,084,618	250,147,000	345,259,253

The general budget balanced for 1913 at 35,608,395 francs; the budget of Tongking at 8,226,710; Annam, 3,976,980; Cambodia, 4,803,000; Cochín-China, 7,181,737; Laos, 928,691; Kwangchow-Wan, 296,022; total, 61,023,535. Debt (Jan. 1, 1912), 245,912,508 francs.

The railway from Saigon to Mytho (the oldest railway in the country) is being extended to Cantho (80 miles). Other lines are the Haiphong-Laoki-Yunnanfu (291 miles), the line from Hanoi to the Chinese frontier (308), Tourane-Hué-Quang-tri and Tourane-Paffu (130), Saigon-Khat-Hoa-Langbian (183). The Yunnan Railway was completed in 1910. The total length of railway reported at the end of 1914 was 1270 miles.

FRENCH LITERATURE. Naturally war was the supreme preoccupation in literature as elsewhere. As compared with the last months of last year, the only difference, if any, would be that the same views were expressed in soberer tone. The confidence as to the outcome of the war remains absolute. This present state of mind of the French people is in keeping with the steady tendency of recent years, as previously pointed out in the YEAR BOOK, away from dilettantism, æstheticism, skepticism, and cynicism, and towards nationalism, socialism (in the broadest sense of the term), and catholicism.

DRAMA. One by one the theatres have opened their doors again; by the end of the year many ran almost normally, except that they produced only a very limited number of new plays, depending on *reprises* like Sardou's *Patrie*, Bornier's *La fille de Roland*, and Kistemaeker's *La Flambee*. For the new plays the place of honor belongs to Maurice Barrès's *Colette Baudouche*, put on the stage early in the year—the story of an Alsatian girl who makes plain why, after 40 years of annexation, there can still be no real sympathy between the conqueror and the conquered. Two plays were inspired directly by events of the war; and neither was very well received. Clearly people did not like to see the villainy of the enemy put on the stage with stark realism, craving plays which would lift them up, not weigh them down. One of the two plays referred to is Nozière's *Prière dans la nuit*. There a loyal French woman of the invaded territory married a naturalized German; discovered that she had given her love to a traitor; and stabbed him before he had time to do more harm. The other is *La Kommandatur*, by Fronson, the Belgian author of the famous *Melle Beulemans*. It is a painful description of the conditions in Brussels under German rule, and especially the story of a German who has been refused the hand of a Belgian girl, returns to Brussels with the German army, takes a cowardly vengeance by having the fiancé of the girl shot, tries to force her to yield to him, and is stabbed for his pains. Plays which dealt with the sacredness of the French cause rather than with hatred of the enemy proved more acceptable. One is a short mystery, by Paul Claudel, the author of *L'Assommoir*.

nonce faite à Marie, called *La nuit de Noël 1914*. Another is an allegorical play by A. Villery, *La Vierge de Lutèce*, four acts celebrating Sainte Geneviève who saved Paris from Attila and the savage Huns—an allusion to modern events which was clear to all. Late in the year the Théâtre Sarah Bernhardt scored a great success with two short plays. The first performance of them was a welcome back to the stage for the divine Sarah, after her operation. *L'Impromptu du Paquetage* is a charming sketch by Maurice Donnay. The stage represents an office for war-relief in Paris, to which come various callers from the humbler classes and tell their touching tales, often heroic, of self-sacrifice on the altar of the mother-country. The other play, *Les Cathédrales*, is more spectacular. In a gray cloud, five religious sisters, representing the cathedrals of the five French regions, are bemoaning the tragic events of the war. Maledictions against the barbarians and prophecies of divine punishments are also heard, uttered with all the passion at the command of Madame Sarah Bernhardt's voice. The Comédie Française, the national theatre of France, offered patriotic matinées in which scenes of French history were revived, the actors of the famous house impersonating famous men and women. The matinée devoted to the French Revolution was one of the most successful.

POETRY. The times favor lyrical production. The newspapers and *revues* publish many poems inspired by the various phases of the war. Some are in a lofty epic vein, some tragic, some satirical and directed against the representatives of German *Kultur*, some cursing the monarch who dares to claim the God of Christianity as a sponsor for the atrocious deeds of his invading army, while others laud the heroism of those engaged in the gigantic struggle or serving at home as women and children can. Few betray the rhetorical and excited tone of J. de Marthold's "Chant de Haine," which he felt called upon to write as a retort to Lissauer's famous German "Song of Hate Against England." A fairly representative collection of war lyrics will be found in *Les Poètes de la Guerre* (Levrault). The real *chansonnier* of the war in France is Botrel, who is already well known for his exquisite songs of French Brittany, and who, by composing war songs in the trenches, has earned the titles "Barde de l'Armée," or "Lauréat des Tranchées," and "Singer of Rosalie"—"Rosalie" being the nickname the French soldiers give their bayonets. His *Chants du Bivouac* will be followed by the *Chants de Route*. There should be noted also: certain of Verhaeren's poems (see, e.g. his "La ferme des marais d'or," in *Grande Revue*, June); Claudel, *Trois Poèmes de Guerre*; Rostand, "Poem to America" (in *L'Illustration*); Le Coq, *Les Germaniades*; *oua; leurs crimes*; Lieut. George Rollin, *Sous la Cuirasse*.

FICION. From Capitaine Détanger, author of *Gens de Guerre du Maroc*, killed in action, September, 1914, came this year, posthumously, *Le Conquérant, Journal d'un indésirable au Maroc*, under the pseudonym E. Nolly. It is a colonial novel telling of a rich young man who has enjoyed life, and is ruined, but who resolves to turn a new leaf in Morocco, where he joins the Légion étrangère, and redeems his past by a glorious death. From no less a novelist than Paul Bourget came *Sens de la mort*, which, besides its general relevance, is related specially to the war.

In it we meet a famous physician, a skeptic, who knows his early doom is sealed by cancer. Believing in no future life, he cannot bear the thought of leaving behind him his dearly loved wife to live, and perhaps love another, after he has gone, and he ventures to suggest that she die with him when his hour comes. She agrees. Then the war breaks out. The doctor is called to treat a young relative of his wife, a soldier, who has been wounded. The soldier had loved the woman, and his patience in suffering, due to his religious faith, touches her. Her husband releases her from her oath, but dies in despair and misery, while the young soldier, who also dies, passes away serenely and in the odor of sanctity, as a good Christian should. The contrast of the two ends, and the edification of the latter wins back the young woman to Christian faith. Marcel Tinayre offered this year her *Veillées des armes*, which has for a background the first days of the war. François de Niou also concerned himself with the war in *Pendant la guerre*, a love story set successively in neutral countries, then in Germany, then in France. Charles Géniaux's *Les fiancés de 1914* is another novel written hastily to provide war literature. *Prince d'Allemagne* describes the morbid tastes of a degenerate German prince, who is thirsty for human blood, and enjoys a man-hunt as another might the pursuit of game. Several volumes of short war stories may be mentioned: René Bazin, *Récits du temps de la guerre*; L. Frapié, *Contes de la guerre*; H. Bordeaux, *La jeunesse nouvelle, deux héros*; and a collection written by soldiers in the trenches, *Contes véridiques des tranchées, par un groupe de poilus* ("poilu" being, since the war, the word for "soldier" in military slang). Here might also be named such publications as Paul Nohain and Frank Delay's *Histoire anecdotique de la guerre* (appearing serially); Paul d'Ivoy's *Femmes et gosses héroïques*. A. Hermant's *Heures de guerre de la famille Valadier*, and Tristan Bernard's (the famous humorist's) *Le poil civil, gazette d'un immobilisé pendant la guerre* describe the life in France back of the fringeline. In the domain of pure fiction a delicate production by George Auriole deserves mention, *La geste des petits soldats de bois et de plomb*, with pictures of toy soldiers by Helle, evoking the French heroic stories of the past, especially of Charlemagne and of Napoleon.

OTHER WAR LITERATURE. Many notable productions belonging to none of the traditional genres we group here. They are expressions by the ablest pens in France, of the emotions inspired by the war: Lavedan, "Les grandes heures" (his weekly articles in *L'Illustration*); Anatole France, *Sur la voie glorieuse*; Rémy de Gourmont, *Pendant l'orage*; M. Barrès, *Alsace-Lorraine*; *L'âme française et la guerre*; *Une visite sur un champ de bataille*; Paul Loti, *La grande barbarie*; Paul Adam, *Hier, aujourd'hui, demain*; P. Marguerite, *Contre les barbares*; J. Richepin, *Prose de guerre*; V. Giraud, *Le miracle français*; André Suarès, *Nous et eux*; *C'est la guerre*; *Italie! Italie!*; Fanchois, *Veillée des armes*. Of a somewhat special character are the articles of G. Hervé, once the fanatic anti-militarist, and author of *Leur Patrie*. Now *Après la Marne* and *La patrie en danger* show him to be an ardent patriot. Hervé finally enlisted in the army. Romain Rolland justifies in *Au-dessus de la mêlée* his position when, at the begin-

ning of the war (see YEAR BOOK, 1914), he endeavored to assume a moderate attitude. Interesting in different ways are: Nothomb, *L'Yser, Les villes saintes*; R. Benjamin, *Les soldats de la guerre*; Juarès, *Six mois de guerre*; the striking description of the life in the trenches, by Charles Le Goffic, entitled *Diamude*; Abbé Klein, *La guerre vue d'une ambulance*. Notable among memoirs written by influential people who tell about political events of recent years with a view to explaining the present are: Madame J. Adam, *L'heure vengeresse des crimes Bismarckiens*—mostly letters written by the celebrated editor of the *Nouvelle Revue*; Léon Daudet (author of *L'Avant-guerre* in which he eloquently but in vain warned his countrymen against the formidable spy-system of Germany), souvenirs under the title *L'entre-deux guerres* and *Hors du joug allemand*. General Canonge's *Histoire de l'invasion allemande en 1870-71* is a remarkable account of German atrocities in the previous war. Gabriel Langlois's *L'Allemagne barbare*, also dealing with the Germans in 1870, contains a striking chapter showing how the famous anthropologist Quatrefages had refused to believe accounts of German barbarities until he saw Germans stupidly trying to destroy the magnificent collections in the Museum of Paris. Mention should also be made of J. Reinach's *Guerre de 1914-15, commentaires de Polybe*, an anthropological study of the German race; and of Alphonse Séché's *Les guerres d'enfer*, discussing such problems as H. G. Wells deals with in his *Anticipations*—the war of the future, not chiefly on the earth, but under ground, under water, and in the air.

Among books on Belgium properly to be considered here are: Verhaeren, *La Belgique sanglante*; P. Nothomb, *La Belgique martyre*; H. Charriant, *Le droit contre la force, la Belgique terre d'héroïsme*; Maxweiler, *La Belgique neutre et loyale*; R. de Gourmont, *La Belgique littéraire*.

LITERARY CRITICISM. In this department the production is slight. There are to be mentioned, however: a belated book by Benedetto, *Madame de Warens d'après des documents nouveaux*, an attack on Rousseau's friend in Annecy and at the Charmettes; and two little books on *Charles Péguy* (see YEAR BOOK, 1914), one by Suarès, one by Seippel. The unexpurgated publication of the *Journal des Goncourt* was to take place this winter; the editors postponed it on account of the war.

LITERARY EVENTS. The transfer to the Panthéon of the remains of Rouget de l'Isle, the author of the *Marseillaise*, took place on the 14th of July. The most notable deaths which occurred during the year and are not directly connected with the war, are: the historian Mézières, and the playwright P. Hervieu, both of the French Academy; Rémy de Gourmont; Stuart Merrill (the Symbolist poet, American by birth); F. Loliée; Madame Lecomte de Nouy (the author of *Amitié amoureuse*); the entomologist J. H. Fabre. Among the men of letters who gave their lives in the war are: Rob. d'Humières (the translator of Kipling); Lafon (author of *L'élève Gilles*); Paul Acker (author of *Soldat Bernard*); L. Pergaud (author of *Goupil*). The French Academy decided to award all its prizes this year to soldiers who had died in the war. The Grand Prix de Littérature went to E. Nolly; the Grand Prix Gonin, to Ch. Pé-

guy; the Prix du Roman to Paul Acker; the Prix Née, to Psichari; and various other prizes to Ch. Dumas, the poet, to Alain Fournier, Pierre Leroy-Beaulieu, Robert d'Humières, Ch. Picar, André Lafon, and others. The Goncourt Academy awarded its yearly prize to R. Benjamin for his *Soldats de la Guerre*, Gaspard.

FRENCH NAVY. See FRANCE, Navy; and NAVAL PROGRESS.

FRENCH SOMALI COAST. A French protectorate on the Gulf of Aden. Official report gives area 120,000 square kilometers, and population (1911) 213,000. Jibuti, the capital, has about 17,000 inhabitants. Imports (1913), 33,916,843 francs (21,024,712 francs in 1910); exports, 47,704,148 (33,566,887). There are 81 miles of railway in the country. The railway from Jibuti into Abyssinia is being extended to Addis Abeba).

FRENCH THEATRE IN NEW YORK. See DRAMA, AMERICAN AND ENGLISH.

FRENCH WEST AFRICA. A French African possession composed of the following colonies and territories, with estimated area and 1911 population as follows:

	Sq. km.	Pop.
Senegal	191,600	1,247,096
French Guinea	239,000	1,927,000
Ivory Coast	825,200	1,265,000
Dahomey	107,000	902,000
Upper Senegal and Niger	782,700 }	6,085,000
Mil. Ter. of the Niger	1,383,700 }	
Mauritania	893,700	250,000
Total	*3,922,000	11,626,000
* 1,514,682 square miles.		

The products and exports are peanuts, rubber, palm kernels, palm oil, gum arabic, live animals, etc. Imports and exports of the colonies in the 1913 trade as compared with the trade in 1910 are seen below (values in francs):

	Imports		Exports	
	1910	1913	1913	1910
Senegal	82,607,568	88,070,795	72,937,825	64,254,179
Upper Senegal and Niger	7,036,901	10,783,390	3,681,987	8,996,984
French Guinea	29,562,772	19,418,212	16,644,752	18,306,405
Ivory Coast	16,049,454	18,154,499	16,401,815	15,749,700
Dahomey	17,838,753	15,152,404	16,477,478	17,886,254
Total	153,095,448	151,574,800	126,148,852	125,193,472

The total value of all imports for 1912 was 134,781,892 francs; of this total, imports valued at 55,336,990 francs came from France, 2,516,518 francs from French colonies, and 76,928,474 francs from other countries. Total exports, 118,567,231 francs; of which, exports valued at 57,614,182 francs were received by France, 95,281 francs by French colonies, and 60,857,768 francs by other countries. At the ports of Senegal there were entered in the 1912 trade 1081 vessels, of 2,318,349 tons; French Guinea, 730, of 724,828; Ivory Coast, 397, of 925,597; Dahomey, 441, of 585,537. The total debt stood, Jan. 1, 1912, at 156,277,336 francs. French West Africa is administered by a Governor-General. The several colonies are under Lieutenant-Governors. Dakar, in Senegal, is the capital. Governor-General (1915), W. Merlaud-Ponty.

For railways, etc., see the articles on the separate colonies and territories.

FRENNSEN, GUSTAV. See GERMAN LITERATURE, Poetry.

FRIENDS, RELIGIOUS SOCIETY OF. There are

four bodies of Friends: the Orthodox, Liberal (Hicksite), Wilburite, and Primitive. The Orthodox body is the most numerous. It has, according to the latest statistics (1914), 98,356 members, 1315 ministers, and 775 meeting-houses. The Hicksite body has 19,597 members, 99 ministers, and 211 meeting-houses; the Wilburite, about 3880 members, 47 ministers, and 48 meeting-houses; the Primitive, about 171 members, 10 ministers, and 8 churches. The Liberal or Hicksite branch has recently shown much activity and a considerable increase in membership. In 1915 three summer schools were held under Hicksite direction at Swarthmore, Pa., at Waynesville, Ohio, and in Canada.

FROHMAN, CHARLES. American theatrical manager, died May 8, 1915. He was born in 1860, in Sandusky, Ohio, but removed when still a young boy to New York City, where he received his education in the public schools. For several years he was employed in newspaper offices, acting from time to time as an usher in theatres. In 1880 he secured employment with the Chicago Dramatic Company with which he remained for two seasons. He then acted for some time as manager of a minstrel troupe. After several years, he became associated with his brother, Daniel, in the management of the Madison Square Theatre. In addition to this, he was interested in a number of minstrel companies, which he sent over the country, and in several touring dramatic companies. His first considerable success was in connection with his management of Bronson Howard's war play *Shenandoah*. This brought him a considerable fortune. He was now well known among theatrical managers. He installed a stock company which included Maude Adams, in a theatre on 23rd Street, New York City, and there produced *Men and Women*, by Belasco and De Mille, and other well-known

plays. Of these was *Charley's Aunt*, one of the most successful farces ever acted in the United States. Some years later Mr. Frohman acquired the Empire Theatre; and he brought one theatre after another in New York City under his control. Then he attempted management in London, where, eventually, he controlled as many as four different theatres. At the time of his death, however, he had parted with all but one of his London houses. Mr. Frohman was always more favorably disposed to English and French playwrights than to those of his own country. Among his closest friendships was that with James M. Barrie, and of Barrie's plays he presented, notably, *The Little Minister* and *Peter Pan*. Among the actors whom he developed into stars were Ethel Barrymore, John Drew, Maude Adams, Billie Burke, and Julia Sanderson. During the later years of his life, he gradually gave up his theatrical activities in New York, and at the time of his death controlled only two theatres in that city. He was, however, associated with other managers in the control of

theatres there and in other cities. Mr. Frohman was little known outside the circle of his most intimate friends. Practically all his interest was in the theatre and in subjects connected with it. He was traveling to England on the *Lusitania* when that ship was sunk by a German torpedo. A friend who was by his side when the torpedo struck said that his last words were: "Why should we fear death? It is the most beautiful adventure in life." See **DRAMA, AMERICAN AND ENGLISH**.

FULLER'S EARTH. In 1910, John Uri Lloyd, of Cincinnati, noted that fuller's earth when added to alkaloids diminished or abolished their bitter taste and that most alkaloids could be removed from solutions by means of it. This activity apparently resided in the finest particles of the earth which Lloyd separated by elutriation from the coarser particles. This preparation has since been known as Lloyd's reagent. (Lloyd believed at first that his reagent would be a universal antidote for alkaloids, but Felter, in 1911, showed that strychnine in combination with Lloyd's reagent was still capable of killing a dog. Lloyd then suggested that the addition of tartaric acid to his reagent might increase its antidotal value, and this has been found to be the fact.) It is now proposed to use fuller's earth as an antidote for poisoning by vegetable alkaloids. Bernard Fantus has made a study of the relative value of several of the preparations of fuller's earth now upon the market in regard to their absorptive power for alkaloids. He finds that Lloyd's reagent is the most active in this respect, whereas kaolin, the fuller's earth of the United States Dispensatory, has comparatively little or no value. The alkaloids tested were morphine, quinine, nicotine, cocaine, aconitine, strychnine, and colchicine. The antidotal value of fuller's earth in morphine poisoning is much superior to that in strychnine poisoning. It has also a marked antidotal action in cocaine, nicotine, and ipecac poisoning. Although it has less value in neutralizing strychnine and aconitine, even here it may save life if combined with sodium dihydrogen. In this connection the work of Kraus and Barbara, with regard to the action of charcoal and kaolin in deep wounds, may be mentioned. They found that filterable viruses are taken up by charcoal so rapidly that they lose their toxic properties for the tissues. They suggest that kaolin and charcoal might be utilized to arrest infection in wounds.

FUR. An interesting development of the year in the American fur industry was the operation of the only sealskin plant in the United States, which was engaged in unhairing and dyeing 7000 skins, the property of the United States government, and secured from Alaskan seals during the closed season. This work was being done at the warehouse of Funston Brothers and Company of St. Louis, and 15 experts from London were engaged in this work. London formerly was the centre of the sealskin industry, and such work as is now done in St. Louis was carried on there. When the closed season of five years ends, and the killing of seals can be carried on by private individuals, it was believed that St. Louis would take the place of London as the sealskin market, and the plant would be increased to take care of the larger numbers being treated. In that event

it was expected that sealskins would be much cheaper.

Alaskan conditions as regards fur-bearing animals have become complex. The steady expansion of the industry of fox-farming has led to injurious inroads on wild game, which the United States Department of Commerce has endeavored to remedy by revised regulations, Circular 246, June 1, 1915. Fur shipments from Alaska are now tabulated for the year ending November 15th, so as to correspond with the annual take in the open season. The following figures indicate the more important furs taken in the years 1913 (precede) and 1914 (follows) respectively: Ermine, 6559 and 6873; red fox, 10,820 and 14,967; white fox, 3756 and 6530; lynx, 4772 and 6930; marten, 9682 and 6497; mink, 47,082 and 35,623; muskrat, 163,616 and 101,202; land otter, 1300 and 1008. It is yet a closed period for fur-seal. The value of the Alaskan furs, land and marine, for 1915 approximates \$460,000, including the 3000 seal-skins taken from animals killed for food on the Pribilof Islands. No pelagic skins were reported.

In October the United States initiated public auction sales of its Alaskan furs, which hitherto have been sold abroad. The list was led by the 513 blue-fox skins, which brought an average of \$114.45 per skin, an advance of about \$72 over the price at the last sale. Eight selected lots of blue-fox brought prices ranging from \$245 to \$273 per skin. The best grade of white-fox sold for \$30 and the lowest for \$17, the average being \$24.55 per skin. Unprime beaver brought from \$9 to \$17 per skin. Silver-fox (non-government) brought prices ranging, for seven pairs, from \$1060 to \$2610 per pair. See also **ALASKA**.

GAMBIA. A British West African colony on the river Gambia (area, 69 square miles), with a protectorate extending on both banks of the river for 250 miles from its mouth (about 4000 square miles). Capital, Bathurst. Population of St. Mary's Island, on which Bathurst is situated, 8807; of the protected districts, 152,000. The cultivation of peanuts is the principal industry. Imports, 1913, £1,091,129 (1910, £578,983). Imports of cotton goods in 1913, £201,797 (£130,611 in 1910); kola nuts, £91,381 (£85,534); rice, £62,512 (£46,087); sugar, £19,422 (£9708); spirits, £17,141 (£7129); specie, £471,835 (£208,544), etc. About 49 per cent of the imports come from England. Exports, 1913, £867,187 (1910, £535,447). Exports of peanuts (mostly to France) in 1913, £622,098 (in 1910, £387,943); hides, £18,718 (£11,310); palm kernels, £9026 (£5640); specie, £204,781 (£112,194); etc. Revenue, 1913, £124,995 (1910, £82,880); expenditure, £95,211 (£63,301).

GARBAGE AND REFUSE DISPOSAL.

The general status of the disposal of garbage, ashes, and miscellaneous refuse was unchanged in 1915. Of the larger cities of the United States that have changed from primitive means of garbage disposal, most depend upon garbage reduction to recover grease and fertilizer base from the garbage. Other cities, large and small, employing improved means of garbage

disposal, rely upon incineration. The Chicago reduction plant, bought from a company in 1914, and immediately improved by the city, was further improved in 1915, and in addition, steps were taken to build incinerating plants for outlying districts. The municipally-owned plants at Cleveland and Columbus continued in use, and a new one was put in operation by Schenectady, N. Y., at the very beginning of the year, and still others were being built for Akron and for Dayton, Ohio. The privately-built reduction works for Los Angeles, Cal. (see YEAR BOOKS for 1913 and 1914), of the Cobwell type, were put in operation. At the Milwaukee garbage refuse-incinerating plant some progress seemed to have been made with the utilization of the heat of combustion for the production of more electric current than was needed for works purposes, the surplus being transmitted two miles and used to pump water for ameliorating the condition of a sewage-polluted river. A much smaller refuse incinerator at Palo Alto, Cal. (5500 population), having a rated daily capacity of 30 tons, burned a total of 1872 tons in the year ending June 30, 1915. It cost \$2468 to collect the refuse, \$1605 to burn it, \$654 for general expense, and \$1593 for capital charges, making a total of \$6322 yearly gross expense for collection and disposal. Householders were charged \$3051 for collection, there was a credit of \$85 for steam delivered to a power plant, and enough miscellaneous revenue to bring the total receipts up to \$3204. This made the net cost of collecting and disposing of 1872 tons of refuse \$3118. The scale of collection charges was from \$0.15 a month for collections twice a month to \$1.75 a month for daily collections. Beginning July 1, 1915, the charges were raised to the following rates per month: Collections twice a month, \$0.25; once a week, \$0.50; twice a week, \$0.80; three times a week, \$1.25; six times a week, \$2.50.

In Canada, as in Great Britain and Europe generally, garbage is burned rather than reduced—almost always combined with other city refuse. The Health Department of Milwaukee, as the winter of 1915-16 approached, suggested in its *Health Bulletin* that householders would do well to drain their garbage, wrap it in paper after each meal, and burn it in their stoves or furnaces when fires were available. By this means decaying, odor-producing garbage would be obviated and, it might have been added, the burden on the refuse incinerator would be lessened.

GARDENING. See HORTICULTURE.

GARNETT, THEODORE STANFORD. An American lawyer, died April 27, 1915. He was born in Richmond, Va., in 1844, and received a high school education. He enlisted in the Confederate army as private and rose to the rank of captain, serving as aide on the staffs of Gens. J. E. B. Stuart and W. H. F. Lee. After 1873 he practiced law in Norfolk, Va., and became one of the best known lawyers in the State. He was a member of many patriotic societies, and trustee of several important institutions.

GARRETT, MARY E. An American philanthropist, died April 3, 1915. She was born in Baltimore, the daughter of John W. Garrett, president of the Baltimore and Ohio Railway. At her father's death in 1884 Miss Garrett inherited a third of his large fortune. Thereafter she devoted her time and money to education and to philanthropy, giving large sums to the advancement of medical education for women and

to woman suffrage. In association with Miss Carey Thomas, now president of Bryn Mawr, and three other Baltimore women, she established in 1885 a Bryn Mawr School for Girls at Baltimore. In 1890 she made it possible for the medical school of Johns Hopkins to open its doors and secured the admission of women to it on equal terms with men. She organized committees of women in many States to raise a subscription of \$100,000 to help endow the medical school, and herself contributed over \$300,000. Her gifts to Bryn Mawr amounted to over \$150,000. From 1893 she gave annually to the trustees of the college \$10,000 to be expended for academic purposes. In 1908 she rebuilt, decorated, and furnished the president's house at a cost of over \$100,000. She was elected a director of the college in 1906. She took an active part in furthering woman suffrage.

GARY SCHOOL SYSTEM. During the past few years Superintendent Wirt has developed a system of organization and instruction in the public schools of Gary, Ind., that has attracted much attention. During 1914 the Mayor of New York accompanied by representatives of the Boards of Education and Estimate visited Gary and examined the system with a view to introducing it into the New York schools. The Board of Estimate employed Superintendent Wirt to devote one week in each of 10 months in 1915 to supervising the introduction of his system into several city schools. Two schools were reorganized under the Gary plan, Public School Number 45, the Bronx, and Public School Number 80, Brooklyn. The Board of Education has authorized its introduction into 12 other schools in the Bronx. This reorganization has met with some determined opposition on the part of some of the school officials and teachers. Doubtless it will be necessary to modify somewhat the system used in Gary before it will be adapted to New York conditions.

One of the chief features of the organization of the schools in Gary is the economical use of the school plant. In ordinary schools the building is used for only a part of the day. If, for example, there are eight classes in a school, there are eight class rooms. During the periods that the classes are in the gymnasium or laboratory or on the playground, these class rooms are vacant. Superintendent Wirt organizes his schools in what has been called the "two-school" plan. In place of the 8 classes in an 8 room building, he has 16 classes. One group of 8 classes assembles at 8:15 A.M. The second group comes at 9:15. The activities of the school are divided into four departments. Department one consists of language, mathematics, history, and geography, and the work is conducted in class rooms of the ordinary type. Department two includes science, manual training, drawing, and music, and the classes are conducted in the shops, laboratory, and studio. Department three consists of mass instruction and is conducted in the auditorium. Department four consists of physical training, play, and application, and is conducted in the gymnasiums, swimming pools, playgrounds, and playrooms. The 16 classes are divided into 4 groups of 4 classes each. If one-half of the grades 1-4 are called group A, one-half of the grades 5-8 group B, the other half of the grades 1 to 4 group C, and the other half of the grades 5 to 8 group D, the plan of operation can be indicated as follows:

PLAN OF OPERATION OF FOUR DEPARTMENTS

Time	Department 1	Department 2	Department 3	Department 4
8:15—9:15	A	B		C D
9:15—10:15	B	A	C	D
10:15—11:15	C	D	A	B
11:15—12:15	D	C		
12:15—1:30	A	B		
1:30—2:30	B	A	D	C
2:30—3:30	C	D	B	A
3:30—4:30	D	C		A B

The above plan of operation for a 16-class school should be read as follows: From 8:15 to 9:15 group A, consisting of four classes, grades 1 to 4, is working in the regular classrooms. Group B, consisting of four classes, grades 5 to 8, is working in the shops, laboratories, and studios. The remaining eight classes, composing groups C and D, are working in the gymnasiums, playrooms, or on the playgrounds. From 9:15 to 10:15 group B is working in the classrooms, group A is working in the shops, laboratories, and studios, group C, consisting of four classes, grades 1 to 4, is working in the auditorium, and the remaining children, constituting group D, are still on the playgrounds or in the gymnasiums or playrooms.

Another feature of the Gary plan is the combining of elementary and high schools in the same building. One of the main objects for this combination is the improved shop, laboratory, and auditorium advantages that are offered to the elementary school.

The following quotation gives the Gary idea of a school plant: "It is a playground, garden, workshop, social centre, library, and traditional school combined under the same management. It is considered of the greatest importance that right conditions be provided for the pleasure and recreation of the child and adult. In addition, a properly organized playground, workshop, and school secure the same attitude of mind toward the reading, writing, and arithmetic that the child normally has for play. Also the shop and school features greatly increase the value of the plant as a recreation and social centre for adults.

The school day may be eight and a quarter hours but the organization is so flexible that children may get all of their academic work during four hours in the forenoon or four hours in the afternoon, and if the parents can convince the school authorities that the children's time can be wisely used elsewhere the children are excused from the other four hours' attendance.

The peculiar features of instruction in the Gary plan are departmental instructors throughout the entire school and a system of industrial education in which artisans are employed as instructors and the regular repairs and additions to school furniture and buildings furnish the basis of instruction. No attempt is made to fit the younger children to specific vocations. The auditorium is used for definite instruction purposes. The buildings are open Saturdays and evenings, also for a period during the summer. It is claimed that the number of adults who make use of the school building is larger than the number of children enrolled in the schools.

There are conflicting opinions regarding the comparative per capita cost of the Gary system and others. By some it is claimed that the school expenses are greatly reduced by the Gary plan. Others seem to find that there is a considerable increase over the regular cost. No

data which are entirely reliable are at present available.

Superintendent Wirt has been employed for part time during the year 1916 to continue his supervision of the work in New York City.

A number of cities have taken the form of organization and adapted it to local needs.

One of the most reliable descriptions of the organization of the schools in Gary is found in *Bulletin, 1914, No. 18, United States Bureau of Education*, entitled "The Public School System of Gary, Indiana." The best description and evaluation of the instruction given in the Gary schools is to be found in *Schools of To-morrow*, by John Dewey.

GEIKIE, JAMES. A Scotch geologist and educator, died March 2, 1915. He was born in Edinburgh in 1839, and was educated at Edinburgh University. In 1861 he entered the English Geological Survey, becoming in 1869 a district surveyor. He was appointed to the Murchison chair of geology in Edinburgh University in 1882, and held this position until his death. In addition he was dean of the faculty of the university. He received many medals from geological and geographic societies, and was one of the founders and at one time president of the Royal Scottish Geographical Society. He was honorary editor of the *Scottish Geographical Magazine*. His writings include: *The Great Ice Age* (1874), *Prehistoric Europe* (1882), *Outlines of Geology* (1884), *Structural and Field Geology* (1905), *Mountains, Their Origin, Growth, and Decay* (1913), and *The Antiquity of Man in Europe* (1914).

GEMS AND PRECIOUS STONES. The total value of precious and semi-precious stones in the United States in 1914 as reported by the United States Geological Survey, was \$124,651. A demand for the gems at the Panama-Pacific Exposition resulted in an increased production of turquoise of \$13,370, as compared with \$8075 in 1913. No discoveries of unusual deposits of gem minerals were made during the year, but a few prospects for the less valuable gems were found. Among these were the pink beryl in Maine, amazon stone, a variety of feldspar, in California, New York, and Maine, sunstone in Arizona, and turquoise in Nevada.

GEOGRAPHICAL SOCIETY, AMERICAN. A scientific body organized in 1852 with headquarters at New York City. During 1915 about 40,000 persons attended the public exhibitions of the society, at which were displayed war maps of Europe, and exhibits on the development of the Philippines and of Alaska. The Cullum Geographical Medal of the society was awarded to J. Scott Keltie, the Daly Medal to Prof. Paul Vidal de la Blache. The society's *Bulletin* for

1915 (984 pages), which was edited by Cyrus C. Adams, covers the new geographical investigations of the year as well as special articles and geographic notes on the European war. In 1915 was published the *Memorial Volume of the Transcontinental Excursion of 1912*, which was announced as in preparation in 1914. On Jan. 1, 1915, the society had 1127 members. The officers for 1915 were as follows: Honorary president, Archer M. Huntington; vice-presidents, James B. Ford, John Greenough, and Anton A. Raven; foreign corresponding secretary, William Libbey; domestic corresponding secretary, Archibald D. Russell; recording secretary, Hamilton Fish Keen; treasurer, Henry Parish, Jr.

GEOGRAPHIC SOCIETY, NATIONAL. The work of the Society in 1915 covered a wider field than in any previous year. Two scientific expeditions were maintained, one engaged in archaeological and geographic research in the highlands of Peru, and the other in the making of Alaskan studies in connection with the development of that Territory. The Society expended \$20,000 as its share in the maintenance of the National-Geographic-Society-Yale-University-Peruvian Expedition, which was in charge of Prof. Hiram Bingham. The results of the expedition, as thus far analyzed, confirm the opinion that Machu Picchu was the capital of the Incas when their nation was in its golden age. During the work of the expedition in its three years in the field more than 12,000 pictures were taken, of which 1000 were of Peruvian Indian types, 3000 of ruins, more than 1000 of manners and customs, and 4000 illustrating the topography, physiography, and geology of the higher Andes. O. H. Tittmann, who for 48 years was connected with the Coast and Geodetic Survey, was elected to succeed the late Henry Gannett as president of the Society, of which Gilbert H. Grosvenor is the director and editor. The *National Geographic Magazine* is published monthly by the Society. The membership was 424,477, a net gain of 87,031 for the year.

GEOLOGY. There were no outstanding features that seemed to mark a definite trend in research during the year 1915, but great activity was manifest in all departments of geology, as indicated by the array of periodical literature and treatises of the most varied subject matter. Only a few of the contributions can be noted, and attention will be paid especially to those of broad significance or popular interest. A prominent place in the record must be assigned to the publication of a general account of the geology of the world (*Handbuch der regionalen Geologie*), which had been undertaken by Steinmann and Wilckens with the co-operation of many assistants for the different countries and regions to be described. In all, 55 parts were to be issued, each following a common plan of treatment. The scope is comprehensive, and includes consideration of the morphology, stratigraphy, petrology, geological history, mountain systems, and economic features, with a supplementary bibliography. In view of the proposed publication of an international geological map, upon which work had already been begun by the issue of the section covering the Continent of Europe, the present undertaking seems timely, both from scientific and practical standpoints.

RADIOACTIVITY AND THE AGE OF THE EARTH.

The possible relations of radioactive energy to the rate of cooling of the earth, on the assumption of a once molten globe, continue to attract attention as further data in regard to the distribution of radium are made known. The researches of Strutt and Joly in this connection have already been discussed (see *YEAR BOOK* for 1909). Arthur Holmes presents the latest results that bear upon the problem and estimates the effect of radioactivity to be equivalent to three-fourths of the present flow of heat; the period of cooling in consequence is raised from 22 million years to 1600 million years, on the basis of an earth heated uniformly to 1000° C. at the start. If the quantity of radium that has been found to exist in the surface rocks were distributed in the same ratios throughout the entire body, it would more than supply the loss of heat from conduction and radiation, and the earth actually would be getting warmer, but there is little doubt that the radioactive energy decreases with depth, as also it is not equally distributed. The oldest igneous rocks now exposed may date back 1500 years, according to the ratios derived from the radioactive elements.

ISOSTASY. Becker considers the geodetic evidence in support of isostasy to suffice for its demonstration. The level at which compensation takes place is the level of easiest fusion or eutectia in the earth, and below that depth the materials have cooled only to a trifling extent or are nearly in a state of ease. The permanence of the continental masses above sea bottom indicates that the mean density of the subcontinental columns of rock down to the zone of compensation is lower than the density of the suboceanic columns. This difference is ascribable to a moderate excess in the proportion of voids beneath the continents (about 3 per cent) or to an excess in mean temperature (some hundreds of degrees) or to a combination of the two causes. It is thought that the outer layer takes in heat energy of very high temperature and discharges it by conduction and radiation at a little above zero, while a part of the energy thus made available is converted into mechanical work implied in uplift, rupture, and plication of the continents. The compensation level, according to the calculations of geodesists, is between 110 and 140 kilometers from the surface. The smaller depth is unacceptable as a basis for the calculation of the earth's age, leading to results that are insufficient for geological requirements. A depth of 140 kilometers indicates an age of 100,000,000 years and the probable value seems to lie between this as a maximum and 68,000,000 years as a minimum. On the basis of 100,000,000 years the contribution of radioactivity would be 26 per cent of the total heat lost. Becker is inclined therefore to take a more moderate view of the importance of this energy than the English physicists whose opinions have already been expressed.

VOLCANISM. The Silliman lectures at Yale University by Iddings dealt with the problems of volcanism and the origin of igneous rocks; they developed no new theories but afforded a critical estimate of those already formulated. The view is taken that the source of thermal action may be found in radioactivity, without calling upon the residual heat of a cooling globe. As to the condition of the earth's interior Iddings holds there is no reason to believe that it may not be solid and cold.

PHYSIOGRAPHY. A series of papers by J. D. Falconer treated of the origin and relations of the earth's physical features, with a philosophic discussion of recent work in this field. As a starting point for his treatment of landforms, he assumed that "the face of the earth was originally fitted out with a certain primary relief, and that this relief has been from time to time locally restored and rejuvenated in order to counteract the activity of the superficial forces of denudation which tend to lessen and remove all irregularities in relief. In this way we advance to the idea of Primary features or forms of the earth's surface, whose origin may be ascribed directly to the activity of the subterranean forces, as opposed to Secondary features or forms which have originated on the surface as the result of the activity of the superficial forces." In the place of Primary and Secondary, which already have definite historical significance in geology, he used the words endogenetic and exogenetic for the two main groups. Endogenetic forms are divided into tectonic forms, arising from radial or tangential activity of the subterranean forces, and volcanic forms, ascribable to local igneous activity as a proximate cause. The exogenetic forms are divided into degradation forms and aggradation forms.

CORAL REEFS. As the result of his studies of the coral formations of Florida and the West Indies, Vaughan concludes that the coral organisms have played a subordinate part in the building of the Floridian plateau. The development of coral reefs took place on a subsiding platform which owed its origin to causes other than those dependent on the growth of corals. The work of corals in the constructional way is not so important as has been believed. All known offshore reefs, which have been investigated, grow on submerged platforms of recent depression. Furthermore, there is no evidence to show that long-continued subsidence has taken place in any coral-reef area, or that a barrier reef began to form as a fringing reef and assumed its present aspect through sinking of the land. This view does not accord with Darwin's theory, but has reference to a single region and perhaps may not be broadly applicable. Another important observation made by Vaughan is that corals and coralline algae are less important agents in the abstraction of calcium carbonate from sea water than many other kinds of organisms; bacteria rank first in this respect, followed by foraminifera and mollusks.

ORIGIN OF DOLOMITE. As a test of the theory that crinoids secrete magnesia and thus possibly participate in the formation of dolomite, Clarke and Wheeler analyzed a number of different species from various geological horizons. In some recent species they found from 7 to 13 per cent, those of warmer waters being relatively richer in the substance, for some unexplainable reason. The fossil forms, from Ordovician to Eocene age, showed in one example about 20 per cent, but the rest only from 1 to 2.5 per cent. The large result in the one case may have been due to a later dolomitization of the rock from which the sample came. The evidence, therefore, does not appear to give much support to the theory.

SEDIMENTATION. In connection with the wear of the lands by erosion and the upbuilding of the continental platforms by deposit of the waste, calculations of the amount of sediment

carried by the great rivers are of pertinent interest. Keilhack contributes some data obtained from measurements of the Yangtze, near its mouth at Wusung. The flow of the river is estimated at 3,500,000 cubic feet per second in flood and 1,750,000 cubic feet per second as a mean for the year. Filtration experiments indicated that 37,500 pounds of detritus were carried per second, or 584,000,000 tons per year. The total discharge of sediment is reckoned at 8840 million cubic feet, enough to cover 300 square miles to a depth of 1 foot.

PRE-CAMBRIAN FORMATIONS. Miller and Knight, working in the crystalline rocks of Ontario, a region made notable by Sir William Logan's early studies, submit a new classification of the formations which embodies many innovations, in fact amounts to a complete recasting of the earlier systems. Its most important feature, perhaps, is the abandonment of the dual idea—the division into two main groups, Archean and Algonkian, adhered to in America—which they regard, with some reason, to be no longer tenable. Accordingly, they range the several parts in a single series. At the base of the system, the oldest in point of time, is the Loganian division, composed of the Keewatin (igneous) and Grenville (sedimentary). Next in order comes the Laurentian intrusives, mostly granitic gneisses. After an interval marked by a great unconformity follows the Timiakian division. Another period of igneous intrusives (Algoman) is followed by a time break or unconformity and then the Animikean which includes the rocks hitherto classed as Huronian. Following an unconformity comes the Keweenawan, the youngest of the Pre-Cambrian series. The present, it may be said, is a transition period in the study of Pre-Cambrian geology, and although the earlier ideas have been largely superseded by the growth of knowledge, opinions are still far apart as to the methods to be used in the arrangement of these very complex formations. The proposed scheme formulates the results of observations in one of the more important areas.

GLACIAL PERIOD. Some recent contributions by European geologists reopen the question as to the existence of more than one general glacial invasion during Pleistocene time, which in the view of many writers—perhaps the greater number of those in Europe and America—should be divided into several stages of ice-advance, separated by interglacial epochs. Six glacial stages have been enumerated by James Geikie, of which two, however, are really post-glacial climatic changes of minor importance. His conclusions were based largely on observations in the Baltic country. In opposition to his interpretation of the evidences, Holst expresses the view that the North German drift has but a single terminal moraine; whereas the so-called interglacial deposits occur locally and sporadically, indicating melting stages but not intervals between successive general advances of the ice. A somewhat similar attitude is taken by Genitz, who maintains the essential unity of the invasion by the ice over northern Europe, though there are evidences of a prolonged interval of melting, not, however, to the extent of bringing about a complete withdrawal. He describes the course of events leading up to the glacial period as introduced by a relative uplift of the land and retreat of the Tertiary sea, with a climate, at

first, much like the present climate in that part of Europe. Further uplift of the land brought on heavy precipitation in the form of snow and the formation of glaciers and ice-sheets which pressed on from the north in Scandinavia and drove the Arctic fauna and flora before it, resulting in the partial migrations of the life forms that were native to middle Europe and commingling of the others with the Arctic types. The pressure of the ice load upon Scandinavia, and perhaps upon the Alps, lowered the gathering ground for the glaciers and brought on milder conditions when the ice-front retreated as far as the Baltic terminal moraines. Then came a renewal of uplift and an increase of the supply for a time. A period of long-continued subsidence brought an end to the invasion, with flooding of the uncovered stream valleys by waters which issued from the glaciers, and the deposit of sediment in terraced beds.

JURASSIC-CRETACEOUS BOUNDARY. The delimitation of the Jurassic and Cretaceous systems as developed in America is one of the larger problems in stratigraphic geology still to be settled. Thus, in the Rocky Mountain region of Montana, Wyoming, Utah, Colorado, and other States there exists a series of beds, variously named in their local distribution but bearing the general designation of the Morrison formation. The beds have been attributed by some writers to the Upper Jurassic, by others to the Lower Cretaceous, and by still others as containing members in each of the systems. The question of their age has recently been considered by a symposium of geologists who discuss it from the several viewpoints of physiography, stratigraphy, paleontology, and paleobotany. An introductory summary by H. F. Osborn presents the problem with the lines of possible evidence, and records the belief that the formation can not be assigned as a whole to either the Jurassic or Cretaceous systems, but occupies an intermediate position. He thinks the problem can only be settled by a comparison of American with European time values, and is of the opinion that the best evidence for correlation between remote areas, like those of different continents, is to be found in paleontology. For the changes of life forms offer the most stable and orderly phenomena serviceable for correlation purposes. Large earth movements which have been sought as a basis, on the other hand, are of uncertain value in the want of proof of their coincidence in point of time. The adherents of the latter methods can only prove their case by showing the existence of great diastrophic movements at the close of Jurassic time in the Rocky Mountain region, in England, and in other parts of the world.

CLOSE OF CRETACEOUS TIME. The prevalent views in regard to the demarcation of the upper limits of Cretaceous time, bringing to a close the Mesozoic era preparatory to the start of the next great era, the Cenozoic, are given in a symposium of American geologists, with an introduction by Osborn. The question revolves largely about the interpretation of evidence and the relative value to be given to earth movements and fossils for stratigraphic correlation, a subject that has already been referred to in a preceding paragraph. The consensus of opinion, from which some dissent is expressed, seems to be that the termination of the Cretaceous should be considered as coincident with the passing of

the age of reptiles, indicated by the extinction of the great families of terrestrial dinosaurs. This view accords with the classification adopted by European geologists. As applied to the Cretaceous formations of the West, the plan is to draw the limits at the top of the Lance beds and to place the Puerco and Torrejon beds containing the remains of the oldest mammals in the Tertiary.

ECONOMIC GEOLOGY. Among recent works of reference on the economic aspects of geology is an English edition of the comprehensive treatise by Beyschlag, Krusch, and Vogt. The translation has been made by Truscott and bears the title, *The Deposits of the Useful Minerals and Rocks, Their Origin, Form, and Content*. A volume by Hager, *Practical Oil Geology*, brings together the results of investigation in regard to the distribution of oil-pools and the structural features that accompany them, with particular attention to recent developments in the American fields. It also contains instructions upon prospecting and mapping of oil territory, the placing of drill-holes, and technical matters.

The methods by which coal beds have been formed have been under investigation for a long time, although it has been well established that they are the result of the decomposition of plant remains. Present opinion is divided, however, in regard to one important circumstance—whether the beds in their actual position are on the sites of the coal-forming forests, as suggested by the occasional discovery of roots and trunks of trees seemingly in place and by the similarity of the underlying clays to depleted soils; or whether the plant materials may have been transported from the place of growth by water and assembled finally on the bottoms of lakes and lagoons, there to be transformed into coal. In support of the latter view it has been shown that coals rich in bituminous matter consist largely of spores and pollen that could hardly accumulate elsewhere than in standing water. E. C. Jeffery has taken up the problem with the use of the microscope, adopting special methods for making the necessary thin sections which ordinarily are difficult to prepare. The examination of many examples of coals of different kinds and from different localities shows the almost universal presence of spores; this the writer regards as strong evidence in favor of the transport or allochthonous theory of origin. Present-day peat bogs, he considers, throw no light on the process of accumulation of plant material in past ages, since they are not found in warmer climates, which are thought to correspond to the probable climate of the Carboniferous age when the coal-forming process was at its height. The different kinds of coal depend upon the relative abundance of the spores. Cannel coal and oil shale are characterized by the largest proportion; coking and gas coals by a plentiful amount; whereas bituminous coals have a relatively small proportion. Anthracite is regarded as a modified bituminous coal, devolatilized by pressure and heat.

The character of petroleum, according to David White, is governed by the state of carbonization of the shales and coal with which the oil may be associated. Petroleum pools are not to be looked for in regions where the coals that lie in or above the oil formation have reached the stage of carbonization at which the fixed carbon exceeds 75 per cent of the whole, as in anthracite

districts. Formations with a relatively high percentage of fixed carbon yield the oils that are highest in saturated hydrocarbons and lowest in gravity, or the oils of most commercial value, such as are found, for example, in the Appalachian region. Formations showing lesser alteration of the organic debris produce oils of lower grade, that is, with more of the unsaturated and heavier hydrocarbons; the lignitic beds are characterized by oils of the lowest grade of all. It would appear, therefore, that as organic matter is altered into material with progressively higher carbon, through the elimination of oxygen, hydrogen, nitrogen, and some carbon, the distillates in the rocks progressively become richer in hydrogen. Instances of the discovery of light oils in association with low-grade districts, from the standpoint of fixed carbon ratio, may be ascribed to the migration of the distillates from sources in more highly altered rocks. The fact that oils are not found in regions of greatly altered rocks but seem to be restricted to those in which the strata have not advanced beyond a very moderate stage of alteration, is scarcely in agreement with the inorganic view of the origin of petroleum.

GEOPHYSICAL LABORATORY. See *CARNegie INSTITUTION OF WASHINGTON*.

GEORGETOWN UNIVERSITY. A Roman Catholic institution for higher education founded at Washington, D. C., in 1789. The total enrollment in all the departments in the autumn of 1915 was 1365. The faculty numbered 201. Hon. Henry S. Boutell was appointed professor of statute law, and Rev. George F. Quirk, S.J., professor of metaphysics. No noteworthy benefactions were received during the year. The library contained about 120,000 volumes.

GEORGE WASHINGTON UNIVERSITY. An institution for higher learning, founded in 1827 at Washington, D. C., as Columbian University. The total enrollment in all departments was 1799. The faculty numbered 225. There were no notable changes in the membership of the faculty during the year. There was received for the establishment of the Knapp Scholarship Fund \$2000. The productive funds of the university amounted at the end of the fiscal year 1915 to \$136,340, and the income to \$5489. The library contained about 50,000 volumes.

GEORGIA. POPULATION. The population of the State, on July 1, 1915, as estimated by the United States Bureau of the Census, was 2,816,289. The population in 1910 was 2,609,121.

AGRICULTURE. The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1914-15 were as follows:

		Acreage	Prod. Bu.	Value
Corn	1915	4,330,000	64,950,000	\$50,661,000
	1914	4,000,000	56,000,000	47,600,000
Wheat	1915	325,000	3,575,000	4,612,000
	1914	140,000	1,694,000	2,270,000
Oats	1915	905,000	17,648,000	11,648,000
	1914	450,000	9,000,000	6,300,000
Rye	1915	13,000	120,000	168,000
	1914	13,000	121,000	182,000
Rice	1915	900,000	26,000	23,000
	1914	1,100,000	31,000	28,000
Potatoes	1915	16,000	1,040,000	1,080,000
	1914	13,000	780,000	819,000
Hay	1915	300,000	a 345,000	5,210,000
	1914	250,000	388,000	5,476,000
Tobacco	1915	1,700	b 1,496,000	844,000
	1914	1,900	1,900,000	475,000

		Acreage	Prod. Bu.	Value
Cotton	1915	4,700,000	c 1,900,000	103,513,000
	1914	5,433,000	2,718,000	89,674,000
		a Tons. b Pounds. c Bales.		

MINERAL PRODUCTION. The total production of coal in the State in 1914 was, with the exception of 1911, the smallest since 1886. It amounted to 166,498 short tons valued at \$239,462. The production in 1913 was 255,626 tons, valued at \$361,319.

FINANCE. The latest report available for the financial condition of the State is for the year ending Jan. 1, 1914. The receipts for the fiscal year were \$6,907,137, and the expenditures \$7,281,030, leaving a balance in the treasury of \$739,625, which includes a balance at the beginning of the year of \$1,113,517. The interest bearing debt amounted on Jan. 1, 1914, to \$6,630,702. Of this amount, bonds, consisting of the bonded debt of the State, amounting to \$3,679,000, matured in 1913.

EDUCATION. The total population of school age in 1913 was 795,484. The total enrollment in the public schools was 615,044, with an average daily attendance of 401,713. The total number of school houses was 7758, and the total value of the same was \$513,543. There were 13,927 teachers. The average monthly salary of white male teachers was \$140, of female teachers \$60; of colored male teachers \$57, of colored female \$30. These figures refer to the special systems. In the county systems the average monthly salary for white male teachers was \$70.52, of white female teachers \$47.80; of colored male \$28.60, and of female \$23. The total expenditures for school purposes in 1914-15 were \$5,505,295, and the total expenditures for higher education \$1,900,648, making a total expenditure of \$7,405,943.

TRANSPORTATION. The total railway mileage in the State of single track on Jan. 31, 1914, was 7325. There were in addition 110 miles of double track. Railways having the longest mileage are the Central Georgia, 1330; the Southern Railway, 909; the Seaboard Air Line, 744; and the Atlantic Coast Line, 484.

POLITICS AND GOVERNMENT. The Legislature in 1915 passed two stringent measures relating to the selling of liquor in the State. The first of these, an anti-shiping bill, provided that a person might receive from outside of the State only two quarts of liquor, one gallon of wine, and forty-eight pints of beer each month. The second measure forbade advertising liquor in any manner. Both these measures were to become effective on May 1, 1916. The Southern Express Company, on November 21st, announced that it would refuse to accept liquor for shipment to the State after May 1, 1916, on account of the stringent provisions of these measures.

POLITICS AND GOVERNMENT. All political events in the State for 1915 were overshadowed by the case of Leo M. Frank, who was in 1914 tried and convicted of the murder of a young girl, Mary Phagan. The circumstances surrounding the trial of Frank were such that the case took on a national interest. It was charged by the defenders of Frank that his trial had been carried on in an atmosphere of hostility both in the courtroom and outside that made it impossible for the jury to render a fair and impartial verdict. The feeling against the prisoner was so intense that he was permitted, by request

of counsel, to be absent when the verdict was announced. An appeal was taken by his counsel to the United States Supreme Court, and on January 19th he was placed under the protection of that tribunal. An order issued by the Court forbade the execution of the death sentence, and made the sheriff of Fulton County, Georgia, responsible for Frank's safety. The attorney for Frank filed in the Supreme Court, February 20th, briefs in Frank's appeal from the Court's refusal to release him in habeas corpus proceedings. The United States Supreme Court on April 19th, by a decision of 7 to 2, denied a writ of habeas corpus. In denying this appeal the majority of the Court held that Frank's absence from the courtroom when the verdict was rendered did not deprive him of due process of law, and that it was a right he could waive and did waive inferentially. The Court also held that the allegations of hostile disorder in and about the courtroom had been rejected by competent State tribunals as untrue. Justices Holmes and Hughes dissented from this opinion. They contended that there had been interference with the deliberations of the jury through the actions of the mob in and about the courtroom, which should entitle him to a review. Frank through his attorneys on April 22nd filed a petition with the State Prison Commission for the commutation of sentence to imprisonment for life. On May 10th he was sentenced to be hanged on June 22nd. Petitions were circulated both in Georgia and in other parts of the United States asking commutation of the death sentence. Over 75,000 letters were received by Governor Slaton, and petitions carrying over 100,000 signatures were sent to him. The hearing for the commutation on petition for another sentence began on May 31st, before the State Prison Commission, and on June 9th the Commission declined to recommend a commutation of the death sentence. This decision was not binding on the Governor, and on June 21st, he commuted Frank's sentence to life imprisonment. The decision was announced barely 24 hours before the time set for the execution, and after he had been taken secretly from the Fulton County jail to the State Prison Farm at Milledgeville. Governor Slaton issued a long and detailed statement giving his reasons for commuting sentence. He said: "Feeling as I do about this case, I would be a murderer if I allowed this man to hang. It means that I must live in obscurity the rest of my days, but I would rather be plowing in a field than to feel that I had that blood on my hands."

For several days the Governor's home was threatened by mobs, and a guard of troops was maintained. Governor Slaton retired from office on June 26th, and was succeeded by Nat E. Harris. On July 17th Frank was attacked while asleep by a fellow convict, William Green. He was severely wounded in the neck, but recovered. On August 16th he was kidnaped by a band of men who overpowered the prison authorities at the State Prison Farm at Milledgeville, Ga., and was taken by automobile to Marietta, where he was hanged in a grove, within a stone's throw of the birth-place of Mary Phagan. The mob numbered about 25 or more men. This act was denounced by the newspapers and officials of the State and by Governor Harris, and a grand jury carried on investigations. No evidence, however, was discovered, which gave

a clew to the instigators of the deed, and in September the grand jury was discharged.

STATE OFFICERS. Governor, Nat. E. Harris; Secretary of State, Philip Cook; Treasurer, Wm. J. Speer; Comptroller and Commissioner of Insurance, W. A. Wright; Attorney-General, Clifford Walker; Adjutant-General, J. Van Holt Nash; Superintendent of Education, M. L. Brittain; Commissioner of Agriculture, J. D. Price—all Democrats.

SUPREME COURT. Chief Justice, Wm. H. Fish; Presiding Justice, Beverly D. Evans; Associate Justices, J. H. Lumpkin, M. W. Beck, Samuel C. Atkinson, and H. W. Hill; Clerk, Z. D. Harrison.

STATE LEGISLATURE:

	<i>Senate</i>	<i>House</i>	<i>Joint Ballot</i>
Democrats	43	180	223
Republicans	1	6	7
Democratic majority ..	42	174	216

GEORGIA, UNIVERSITY OF. A State institution for higher education founded at Athens, Georgia, in 1785. The total enrollment in all departments in the autumn of 1915 was 632. There were 68 members of the faculty. There were no notable changes in the faculty during the year, and no noteworthy benefactions were received. The university is supported almost entirely by State appropriations. The productive fund amounts to about \$400,000. The library contains about 50,000 volumes. The president was D. C. Barrow, LL.D.

GERMAN ACTIVITIES IN THE UNITED STATES. See UNITED STATES AND THE WAR.

GERMAN EAST AFRICA. A protectorate of Germany between the East Africa Protectorate and Portuguese East Africa, bordering the Indian Ocean from the mouth of the Umba to latitude 10° 40' S. It borders Victoria Nyanza at the north, Lake Nyassa at the south, and Lake Tanganyika at the west. The protectorate was established by the Germans in 1885. The rights of the Sultan of Zanzibar over a strip of coast territory were acquired in 1890 by payment of 4,000,000 marks. The capital is Dar-es-Salaam. The estimated area is 995,000 square kilometers (384,170 square miles). The great extent of the country included within the protectorate may be better appreciated by pointing out that it is about equal to the combined areas of New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Ohio, Indiana, Illinois, Michigan, and Wisconsin. The native population is estimated at 7,646,000; other colored, 15,000; whites (Jan. 1, 1913), 5336; total, about 7,666,000. Of the whites, 4107 were German. The number of schools is reported at 1944, with 114,964 pupils. There are ten Protestant and three Roman Catholic missions. In the year 1912-13, 353 whites and 18,868 colored persons were convicted in the courts. The military in 1914 numbered 260 Germans and 2472 colored; the police, 67 Germans and 2140 colored.

The natives cultivate the soil to some extent, raising corn, pulse, and bananas for their own use; they also practice grazing. In 1912, there were 43,617 cattle and 41,647 sheep and goats belonging to whites, and 3,950,250 cattle and 6,398,300 sheep and goats belonging to natives. German plantations, mostly near the coast, produce coconuts, vanilla, tobacco, rubber, coffee,

sugar, tea, cacao, cotton, sisal, cardamoms, etc. Imports and exports in 1907 were valued at 23,806,000 and 12,500,000 marks respectively; in 1910, 38,659,000 and 20,805,000; in 1912, 50,309,000 and 31,418; in 1913, 53,358,000 and 35,550,000. Imports from and exports to Germany in 1912 were valued at 25,819,000 and 17,827,000 marks respectively. The principal exports in 1912 and 1913 were valued as follows: sisal, 7,359,000 and 10,710,000 marks; rubber, 8,426,000 and 8,567,000; hides and skins, 4,087,000 and 5,591,000; raw cotton, 2,110,000 and 2,414,000; copra, 1,563,000 and 2,348,000; earthnuts, 1,273,000 and 1,918,000; insect wax, 829,000 and 1,415,000. Vessels entered at the ports in 1912, 1034, of 1,913,743 tons. The Urambara Railway, in the north, from Tanga to Muhesa, has a length of 219 miles. The Central Railway, from Dar-es-Salaam, reached Kigoma, on Lake Tanganyika, Feb. 1, 1914, the length being 673 miles. Total length of railway in operation in the spring of 1914, 792 miles; under construction, 104 miles. In 1913-14, the local revenue amounted to 16,506,000 marks; expenditure, 23,771,000; in addition, expenditure from loan, 37,500,000. The budget for 1914-15 balanced at 61,271,068 marks, the estimated revenue consisting of 20,471,068 marks local receipts, 3,300,000 marks imperial contribution, and 37,500,000 marks loan.

HISTORY. In the early part of January the British made a descent upon the coast of German East Africa, but were repulsed with considerable losses by the German defenders. On January 8th a British expedition from Mombasa occupied the German island of Mafia off the coast of German East Africa. The following day the German port of Shirati on the east shore of Victoria Nyanza was captured by an Anglo-French expedition. The Germans concentrated in front of Jassin on January 12th and compelled its surrender, though the British tried to bring reinforcements to the town. On February 28th the British declared a blockade on the German East African coast. In March a German raiding party of 300 were repulsed in the Victoria Nyanza region by a party of the King's African Rifles. Few casualties were suffered on either side. Late in April the Germans made several efforts to destroy the connections of the British and French, and were successful in one instance in blowing up a bridge belonging to the Uganda Railway. The damage, however, was only temporary. Between May 9th and 22nd two British expeditions managed to clear the country of the enemy for nearly 30 miles around Simbaenti and to recapture a British steamer on Lake Victoria Nyanza. In the last of June the British under Brigadier-General Stewart were successful in capturing Pukoba, an important port on the west side of the same lake, with losses of only 10 killed and 25 wounded. On September 10th a troop of South African Rifles and a company of the King's African Rifles defeated a German detachment south of the Songue River on the German border. See also **WAR OF THE NATIONS, Africa.**

GERMAN EVANGELICAL SYNOD OF NORTH AMERICA. There were in this denomination in 1915, 290,803 communicants, 1365 churches, and 1058 ministers. Although communicants of this denomination are to be found in nearly all parts of the United States, they are most numerous in the Central and North Central States. The church property is valued

at about \$1,500,000, and over \$1,000,000 is annually expended on the maintenance of churches. The denomination supports missionaries in India, where there are over 4000 adherents. Papers are published in St. Louis. There is a college at Elmhurst, Ill., with a theological seminary at St. Louis. Among other beneficent agencies are charitable institutions for orphans, superannuated ministers, and the widows and orphans of deceased ministers.

GERMANIC LANGUAGES. See **PHILOLOGY, MODERN.**

GERMAN LITERATURE. Comparison of German literature in 1915 with that of the preceding year shows that the war has affected its quality far more than its quantity. For after the first paralyzing effect had worn off, the publication of books and periodicals was resumed with the customary enterprise and energy, and the amount produced was hardly below that of normal times of peace. With a tidal wave of high-strung emotionalism sweeping across the country and carrying its infection into every hut, it was natural that lyric production should be stimulated to an unusual degree. But it was hardly to be expected that poets who, at other times, allowed three or four years to elapse between their individual books of verse, would now produce two or more volumes in a single year. The nationalistic *Leitmotive*, too, was natural under the circumstances, and that it dominated even drama and fiction was not surprising to any reader familiar with the German temperament and with the magic process of mass psychology. That this willing obedience to a powerful suggestion indicates a reaction against that individualism which not so long ago scorned the herd instinct and the herd impulse, is significant; it can be traced in most of the literary products of the year. Another curious phenomenon, and one calculated to contradict the vaunted *Sachlichkeit* of the German mind, is its inability at this time to dissociate the emotional mood of the moment from that intellectual aloofness which alone makes for impartiality. It is interesting to note that the purely critical literary activity has perceptibly diminished, while the number of works, more timely than literary, is quite out of proportion to the whole output of the book mart. It is far more difficult to separate the wheat from the chaff since the main source of inspiration is the war and most writers seem bent upon voicing only the popular sentiment and reflecting little beyond the average attitude of the masses.

FICTION. Two novels stand out of the multitude of works of fiction and challenge serious attention. The first is *Das Gänsemännchen* by Jacob Wassermann, which derives its name from the figure familiar to visitors of Nuremberg, and tells the story of an erratic musical genius, suggesting remotely the influence of Romain Rolland's *Jean Christophe*, though far from reaching the Frenchman's spiritual height. The second is *Lebenssucher* by Lily Braun, whose more or less autobiographical *Memoiren einer Sozialistin* has become a work of documentary importance for our time. In her new book the author makes a young aristocrat the representative of the young generation seeking a new meaning and new values of life, touching here and there upon the race problem, the woman question, social reforms, and other engrossing topics of our time, until the war engulfs the hero and makes an

end of his quest. A posthumous story by Gerhard Ouckama Knoop, *Das A und O*, is a pathetic reminder that no contemporary has appeared to take his place. A new book by the Swiss novelist Jacob Schaffner has always some feature of interest and his latest, *Der Bote Gottes*, reflects his strong personality. Wilhelm Fischer-Graz has published a story of the Styrian vinelands, *Die Fahrt der Liebesgöttin*. Hans Land's novel, *Staatsanwalt Jordan* is a picture of contemporary society. Alfred Schirokauer's *Die siebente Grossmacht* belongs to the same class, but is of cruder calibre. Walter Bloem successfully strikes a popular note in *Das verlorene Vaterland*. Laurids Bruun's *Die freudlose Wittve* and Emil Ertl's *Das Lächeln Ginevra's* are of more finished literary quality and of more limited appeal. The spirited grace of Felix Salten's work makes *Die klingende Schelle* fascinating reading. Arthur Schnitzler's *Der blinde Geronimo und sein Bruder* lacks none of the qualities that have endeared him to a large circle of readers. Anton Ohorn has given us *Hans Holger's Liebesirrungen*, Ewald Gerhard Seeliger *Der gelbe Seedie*, Richard Skowronnek *Das grosse Feuer*, Hanns von Zobeltitz: *Der Alte auf Topper*, and Johannes von Dewall *Auf verlorenem posten*. Kurt Aram has substituted *Die Kusine aus Amerika* for the traditional and much abused American uncle. Another story by the same author is entitled *Der Schatten*. Kurt Martens is a name that always merits attention; his new story is *Hier und drüben*. Wilhelm Hegeler, too, has sent out a new novel, *Die goldene Kette*. The indefatigable Richard Voas has written a novel with the catchy title *Der heilige Haas*. Max May is a newcomer whose Alsatian story *Die Rouillions* has attracted much attention. Bruno Frank, who had so far been known only as a writer of lyric verse, has touched upon Russian revolutionary intrigues in his story *Die Fürstin*, though its chief interest lies in the hero. A number of novels seem more or less directly inspired by the war, among them Ulrich Rauscher's curious story *Vierzig Jahre aus dem Leben eines deutsch-französischen Offiziers* which, though set in the Napoleonic era, suggests many present day inferences. Others are Karl Bleibtreu's *Bismarck*, which he ponderously calls *Weltroman*, Max Geissler's *Nach Russland wollen wir reiten*, Alexander Castell's *Der Tod in den Lüften*, Max Dreyer's *Der deutsche Morgen*, Ernst von Wolzogen's *Landsturm im Feuer*, Rudolf Hans Bartsch's *Der Fliieger*, Nanny Lambrecht's *Die eiserne Freude*, and Arthur Zapp's *Der Spion* and *Verschollen*. Margarete Böhme has contributed a volume of war fiction under the title *Kriegsbriefe der Familie Wimmel*. Ida Boy-Ed has sent out no less than three novels: *Stille Helden*, *Vor der Ehe*, and *Aus einer Wiege*. Clara Viebig's *Eine Handvoll Erde* is of strongly emotional appeal. Maria Janitzschek's *Die Sterne des Herrn Ezelin* has no little charm. Hans von Kahlenberg's *Misere* is cleverly told. Humor is so rare a quality in modern German fiction that the Alsatian René Schickele deserves special mention for his *Trimpopp* und *Manasse*. Freiherr von Schlicht, too, long identified with humorous and satirical stories of military life, continues in his popular vein, both in *Der Flitzmajor* and *Fürstlich Blut*.

The short story is represented by a great number of books, the majority of which contain war

sketches, which do not often rise above the journalistic level. Carl Hauptmann's *Rübezahlbuch* is a noteworthy exception, being a collection of fanciful stories in legendary style, the centre of which is the famous spirit of the Riesengebirge. The only foreign note that enters into that book is the attempt at bringing it up to date by patriotic allusions. The new book by the author of the inimitable *Florentinische Novellen*, Isolde Kurz, is entitled *Cora und andere Erzählungen*. Fritz Blei's *Avalun: Geschichten aus allerlei Paradiesen* and Max Dauthendey's *Geschichten aus den vier Winden* are distinctive in style. Ewald Gerhard Seeliger calls his collection of short stories *Das deutsche Dekameron*. Albert Geiger's *Michael Purtscheiner und andere Erzählungen*, Hermann Hesse's *Knulp*, a book containing three stories, Adolf Schafheitlin's *Das hohe Schweigen*, Alfons Paquet's *Der Sendling*, Rudolf Presber's *Der Don Juan der Bella Riva*, and *Die dritte Kugel* by Leo Perutz are all marked by some striking individual features. The name of Hermann Löns is always greeted by his readers, for his stories of animal and hunting life stand apart from other German fiction. His new book is entitled: *Goldhals. Tier- und Jagdgeschichten*. Kurt Münzer, who some years ago made his debut with a curious mystery play, figures on the title-page of two volumes: *Der jüngste Tag* and *Der graue Tod*. That Marie Madeleine's latest volume should bear the title *Rivieranovellen: Regenbogen der Liebe* is in keeping with the erotic character of her lyric verse. A posthumous volume by Joh. Victor Widmann is entitled *Ein Doppelleben*. Of the books directly inspired by the war must be mentioned Carl Busse's *Feuerschein Novellen und Skizzen aus dem Weltkrieg* and *Klar Schiff*, stories of naval warfare of 1914-15, Lisbeth Dill's *Der Tag in Nancy*, Felix Salten's *Abschied im Sturm*, Emil Lucka's war anecdotes entitled *Das brennende Jahr*, Alexander Castell's *Der Kriegspilot*, Dora Duncker's *Berlin im Kriege* and the very popular, though rather coarse-grained, books by Karl Ettlinger.

POETRY. The most ambitious poetical work of the year is Gustav Frenssen's epic *Bismarck*. Richard Schaukal has published *Kriegslieder aus Oesterreich 1914* and a book of sonnets entitled *Standbilder und Denkmünzen 1914*. Gustav Schüller, too, has two books of verse to his credit: *Unerschütterlich bereit* and the sacred war lyrics *Gottes Sturmflut*. Rudolf Presber appears with a book of *Neue Kriegsgedichte*. The same patriotic note is voiced eloquently in Rudolf Alexander Schroeder's *Heilig Vaterland*, Max Dauthendey's *Des grossen Krieges Not*, Gustav Falke's *Unsere Helden*, Josef von Lauff's *Singenes Schwert*, Ludwig Ganghofer's *Eiserne Zither*, Will Veaspe's *Vom grossen Kriege 1914-15*, Richard Nordhausen's *Das Fähnlein licht an der Stange*, Karl Hans Strobl's *Eine gute Wehr und Waffen*, Katharina Botaky's *Ostpreussens Peuerzeit*, Rudolf Herzog's *Ritter, Tod und Teufel*, Hans Benzmann's *Kriegsgedichte für Kaiser und Reich*, and the *Kriegsgedichte und Feldpostbriefe* of Walter Heymann which were published after death had claimed him on the western battlefield. René Schickele, the Alsatian, avoids direct reference to the war in his little book of lyrics *Mein Herz, mein Land*. Emanuel Bodmann, however, entitles his volume *Mein Vaterland* and Alfons Petzold, the Austrian proletarian

poet, strikes a more humanitarian note in *Volk, mein Volk*, while his *Johanna* is a purely personal document. Other books of verse are Hermann Hesse's *Musik des Einsamen*, Kurt Martens's *Verse*, Marie Vaërtling's *Durstige Heckenrosen am Meer*, Robert Walser's *Kleine Dichtungen*, Karl Ernst Knodt's *Vom Bruder Tod*, Hans Schmidt-Kestner's *Gedichte*, Franz Werfel's *Einander*, and Börries von Münchhausen's *Alte und neue Balladen und Lieder*.

DRAMA. One of the strongest plays of the year is Emil Ludwig's historical drama *Friedrich, Kronprinz von Preussen*, dealing with the tragic youth of Frederick the Great and remarkable for the excellent portrayal of his friend Katte. Another historical drama is Dietrich Eckart's *Heinrich von Hohenstaufen*, and Julius Baumann has undertaken to dramatize scenes from the memoirs of Bismarck. Plays directly owing their inception to the war are *Des Kaisers Soldaten* by Hermann Essig, a drama of mobilization, Paul Enderling's *Ostpreussen*, Paul Ernst's *Preussengeist*, and Theodor Wundt's *Disziplin*, a three-act drama of soldier life. An interesting work is Carl Hauptmann's volume of one-act plays, entitled *Aus dem grossen Kriege*. The scene shifts from Silesia, where the watchman on the mountains first proclaims the news of war, to the western and eastern front and the dramatic climax is almost invariably accompanied by an outburst of patriotic song. Otto Burchard has chosen to make *Judith und Holofernes* the medium of his patriotic sentiment. Otto Steinbach has written a poetic drama: *Baldur's Tod*. Eduard Stucken, who a few years ago attracted attention by a poetic drama on a subject of mediæval lore, presents in *Die Hochzeit des Adrian Brouweis* a story of artist life, strong in details, but ineffective as a whole. Ernst Hardt, the one time winner of the Schiller prize through his *Tantris der Narr*, has sadly disappointed his admirers by his trivial treatment of an old familiar theme in his three-act drama *König Salomo*. Karl Schönherr, also a prize-winner of some years ago, scored a success with his five-act drama *Der Weibsteufel*. Franz von Königsbrunn has revised and adapted Otto Julius Bierbaum's *Fortuna*, a drama of adventure. Erich Oesterheld calls his play *Die einsamen Brüder* a sentimental comedy. Rudolf Hans Bartsch made an unsuccessful attempt at a problem play in the tragedy of a mother, *Ohne Gott*, while Marie Vaërtling's *Das Recht des Kindes* holds out promise of better work to come. A powerful first play was *Armut* by Anton Wildgans, an Austrian so far known only as the author of lyric verse of strong individuality. Herbert Eulenberg perseveres in courting the dramatic muse, but has not made a profound impression by his latest effort: *Der Frauenaustausch*. Felix Philippi has proved by *Der Fall Ravelli*, which is founded upon a criminal plot, that he has lost none of his clever constructive power. Hans Müller's *Die blaue Küste* failed to rouse the interest which his earlier work had called forth. The mood of the time does not make for comedy and only a few authors have attempted it. Hermann Bahr, the indefatigable, has written a farce: *Der muntre Seifensieder*. Siegfried Trebitsch, the translator of Shaw, calls his comedy *Gefährliche Jahre*, Ernst Kamnitzer has written *Die Nadel*, and Carl Sternheim figures as the author of two plays: *Die Scharmante* and *1913*. Heinrich Mohr has edited a

volume of two war farces: *Kriegsschwünke aus alter Zeit*.

CRITICISM, LITERARY HISTORY, ETC. The year has seen the publication of remarkably few important works of criticism. The most noteworthy are Erwin Rhode's *Der griechische Roman und seine Vorläufer*, Max Zobel von Zobeltitz's *Georg Büchner, sein Leben und Schaffen*, Dr. Otto Ritter's *Geschichte der französischen Balladenform*, Dr. Ernst Falk's *Das romantische Element in Prosper Mérimée's Roman und Novellen*. E. Heusermann is the author of a work on Schiller's dramas. Dr. Bruno Busse is the author of *Das Drama*, a work in three volumes, tracing the development of the drama from romanticism to the present time. Dr. Alois Brandl has embraced the occasion to allude to the England of to-day in the book entitled *Byron im Kampfe mit der englischen Politik und die englische Kriegerlyrik von heute*. Adolf Schafheitlin holds up the mirror to modernism in his *Lehrbuch des Lachens*. Thomas Mann has forsaken fiction for a serious and readable historical work: *Friedrich und die grosse Koalition*. Jacob Wassermann, too, has produced a historical volume of interest: *Deutsche Charaktere und Begebenheiten*. Julius Bab has written *Preussen und der deutsche Geist*.

BIOGRAPHY, MEMOIRS, LETTERS. Ricarda Huch is the author of a valuable study of the character of *Wallenstein*. Adolf Paul has published the memoir and letters of August Strindberg. Of Bismarck's biography there have been published several new editions. The *Letters of Johanna von Bismarck* have also been reissued. New editions of Goethe's correspondence with Marianne von Willemer and with Zelter are on the market. Theodor Storm's *Briefe an seine Braut* reflect the admirable personality of the poet-novelist. Josef Victor von Scheffel's *Briefe an Anton von Werner*, with annotations by the latter, are interesting reading. Wilhelm Bode has published a volume of *Stunden mit Goethe*, in which he collected Goethe's opinions of the French and English. Richard Wagner's *Autobiography* has appeared in a new edition.

TRAVEL. Alfons Pacquet, whose verse was inspired by various climes and derived much of his charms from his exotic subjects, has now written a book of travel in prose: *In Palästina*. Norbert Jacques, a Luxemburgian by birth, is the author of *Die Flüchtlinge*, in which he describes a journey through Holland behind the Belgian front. Hans Hoffman's *Länder und Leute* is another readable book of its kind. Hermann Bahr entitles an invitation to Salzburg: *Das österreichische Wunder*.

CURRENT EVENTS. So voluminous is the literature called forth by the war and so difficult to classify, that it is necessary to consider it separately. The author responsible for the greatest number of books of this kind is Dr. Hans F. Helmolt, who has written among other works, *Der Weltkrieg in Bildern und Dokumenten nebst einem Kriegtagebuch*, *Die geheime Vorgeschichte des Weltkrieges auf Grund urkundlichen Stoffes*, and a study of Bismarck, who is being referred to more and more frequently. The Wagnerites, too, have been busy airing their opinions, Houston Stewart Chamberlain having published a new volume of *Kriegsaufsätze*, and Hans von Wolzogen, *Gedanken zur Kriegszeit*. Of war diaries may be mentioned Dr. Artur Kutscher's *Kriegtagebuch*,

and Aage Madelung's *Mein Kriegstagebuch*, the work of a Danish author writing in German. Other works dealing with the campaign in the East or West are Karl Hans Strobl's *Zwischen Weichsel und Karpathen*; Artur Holitscher's *In England, Ostpreussen u. s. w.*; Adolf Koster's *Der Tod in Flandern*; Norbert Jacques's *London und Paris im Kriege*; Ludwig Ganghofer's *Reise sur Front 1915*; Alfons Pacquet's *Nach Osten*; Bernard Kellermann's *Der Krieg im Westen*; and *Kriegsfahrten eines Johanniters mit friedlichem Zwischenspiel*, by Fedor von Zobeltitz. The political aspects of the war are treated in Dr. Karl Notzel's *Der entlarvte Pan-slavismus und die grosse Aussöhnung der Slaven und Germanen*; Dr. Karl Federn in *Die Politik des Dreiverbandes und der Krieg*; Gustav F. Steffen in *Weltkrieg und Imperialismus*; Karl Bleibtreu in *Englands grosse Waterloo-lüge*; Alfons Pacquet in *Der Kaisergedanke*, and others. Otto Hauser, too, has turned from his purely literary labors to the all-engrossing problems of the day in *Rasse und Rassefragen in Deutschland*. The spirit of books like *Deutschland als Welternzieher*, by Johann August Lux, Friedrich Lienhard's *Deutschlands europäische Sendung*, and Walter von Molo's *Deutsch sein heisst Mensch sein*, is evident from the titles. Oskar A. G. Schmitz offers a forecast of the Germany that is to be after the war in *Das wirkliche Deutschland*. Karl Joel's *Neue Weltkultur*, Carl Hauptmann's *Die uralte Sphinx*, and Alexander Schneider's *Kriegsgestalten und Todesgewalten* are other interesting contributions to the literature of the war. Appreciations of the military leaders are numerous, among them *Unser Hindenburg*, by Paul Bliss, and *Von Hannibal zu Hindenburg*, by Karl Strecker. A contribution to the psychology of war is offered by Dr. Magnus Hirschfeld in *Warum hassen sich die Völker?* Friedrich Lienhard has written *Das deutsche Elsass*. A lighter note is struck by Hermann Bahr in *Kriegsregeln*, Eberhard Buchner in *Kriegshumor*, and Rudolf Greinz in *Die eiserne Faust: Martern auf unsere Feinde*. Women have contributed a number of books: Dr. Gertrud Bäumer, *Der Krieg und die Frau*, Leonore Niessen-Deiters, *Kriegsbriefe einer Frau*, and Lena Christ, *Unsere Bayern 1914*. The peace problem has been touched in Heinrich Lhotzky's *Um den Völkerfrieden*. More remotely related to the war are Peter Altenberg's *Feuchung*, Felix Poppenberg's *Der Sommerhut von 1915*, and the essays, *Wege und Umwege*, by Annette Kolb, who deserves credit for having publicly denounced the press for sowing hatred and creating national prejudices.

NEW EDITIONS. It is curious to note that neither Goethe nor Schiller is represented by as many new editions as in other years, Goethe's *Novellen und Märchen*, with an introduction by Paul Ernst being the only important addition. On the other hand, a writer whom the young generation had forgotten, if not deliberately ignored, has come into astonishing prominence: Emanuel Geibel, the singer of innocuous sentiment and hollow pathos. A volume of his lyrics has been reissued: *Heroldsrufe*, his drama *Sophonisbe*, and there are new complete editions of his poems and his dramas. Selections from the writings of Nietzsche have been published under the title *Nietzsche-Worte*. Selections from the writings of Richard Wagner are offered under the title, *Was ist deutsch?* There is

also a popular edition of Richard Wagner's *Complete Works*. The German tales by the Grimm brothers have made their annual reappearance in a new form. There have been new editions of Wilhelm Heinse's *Ardinghello oder die glückseligen Inseln*, of Gottfried August Bürger's poems in two volumes, of Clemens Brentano's *Geschichte vom braven Kasperl und schöner Annerl*, of Klaus Groth's letters on High and Low German, of the complete works of Heine and of Wildenbruch. It is not far to seek the reason of such reprints as the letters of Blücher, Fichte's *Über den Begriff des wahren Krieges*, selections from the writings of Görres under the title *Flammenszeichen*, the soldier and war stories of Johann Peter Hebel, and selections from the robust preachments of the worthy capuchin Abraham a Santa Clara, entitled *Kriegsbuch für die Seele*. The most attractive new edition is that of Gottfried Keller's *Heimat und Dichtung*, with drawings by Emil Bollmann.

TRANSLATIONS. Translations have been numerous. Among American authors so honored are Edgar Allan Poe, whose poems translated by Hedwig Lachmann and Hedda Möller-Bruck complete the German edition of his works. Only one American novel has appeared on the market: Meredith Nicholson's *House of a Thousand Candles*. The only English author represented is Conan Doyle. Paul Claudel, who had been introduced to the Germans by Emil Jacques-Dalcroze in the festival hall of his school at Dresden-Hellerau, is represented by his *Transfiguration*. Other French authors of whom translations have appeared are, Count Gobineau, Henri Bordeaux, Gustave Flaubert, Felicien Mallefille, and Le Sage. There are translations from the Danish of Holger Drachmann, Karin Michaelis, and Johannes V. Jensen; from the Norwegian of Knut Hamsun; and from the Swedish of Selma Lagerlöf. There is a new translation of the works of Sappho. *The Trojan Women* of Euripides has been translated by Franz Werfel. A collection of Chinese novels has appeared, and a volume of the memoirs of Li Hung Chang. The only book from the Turkish, Emin Mehmed's *Turks Awake*, seems a contribution to the literature of the war.

OBITUARY. Among the writers who have died within the past year are Albert Geiger, poet, novelist, and dramatist; Carl F. Glasenapp, the biographer of Wagner; Dr. Max Friedländer, editor of *Kladderadatsch*; Dr. Franz Schnorr von Carolsfeld, former director of the royal library at Dresden, and author of a history of *Meistergesang*; Käthe Sebaldt, who, under her pseudonym Miriam Eck, was known as a writer of lyrics and an excellent translator; Dr. Karl Lamprecht, the historian; Georg Busse-Palma, brother of Carl Busse, and, like him, a lyric poet; Felix Poppenberg, the essayist; Fritz Marti, the Swiss writer; and Walter Heymann, the lyric poet, one of a number of less known writers who fell on the battlefield.

GERMAN NEW GUINEA. A protectorate of Germany, including Kaiser-Wilhelmsland and the Bismarck Archipelago, with the German Solomon Islands. Estimated area, 240,000 square kilometers (92,664 square miles). Dependencies are the Caroline, Palau, Mariana, and Marshall islands; area, 2476 square kilometers (956 square miles). The total native

colored population of protectorate and dependencies is estimated at 600,000; other colored, 2000; whites, Jan. 1, 1913, 968 in the protectorate and 459 in the dependencies (of whom, German 746 and 259). Missions, four Protestant and five Roman Catholic. Schools, 516, with 18,486 pupils. The trade of the protectorate was valued at 5,299,000 marks imports, and 4,109,000 marks exports in 1911; in 1912, 5,872,000 and 5,041,000. The chief export is copra, amounting to 3,332,000 marks in 1911 and 4,052,000 in 1912. Imports from and exports to Germany in 1911, were valued at 2,554,000 and 3,330,000 marks; in 1912, 2,221,000 and 4,489,000. Imports and exports of the dependencies in 1911, 1,729,000 and 6,271,000 marks; in 1912, 1,963,000 and 5,164,000. The chief export is phosphate, valued at 5,308,000 marks in 1911, and 3,468,000 in 1912. Imports from and exports to Germany in 1911, 462,000 and 2,615,000 marks; in 1912, 441,000 and 1,613,000. Local revenue (for protectorate and dependencies) in 1912-13, 1,760,000 marks; in 1913-14, 2,096,000; expenditure, 3,410,000 and 3,830,000. The budget for 1914-15 balanced at 3,833,886 marks, the estimated receipts including an imperial contribution of 1,717,022 marks. The capital is Rabaul, in Neu-Pommern. A German protectorate was declared over Kaiser-Wilhelmsland and the Bismarck Archipelago in 1884; Germany acquired the dependencies in 1899.

In 1914 German New Guinea was occupied by British Colonial troops. See 1914 YEAR BOOK.

GERMAN PLOTS. See CANADA, *History*; and UNITED STATES AND THE WAR.

GERMAN REFORMED CHURCH. See REFORMED CHURCH IN THE UNITED STATES.

GERMAN SAMOA. A protectorate of Germany in the South Pacific, consisting of the islands of Savaii (652.9 square miles), Upolu (335.5), Manono (3.3), and Apolima (1.8). Total area, 993.5 square miles. Besides the islands mentioned there are several islets of inconsiderable area. Estimated native population, 38,000; whites, Jan. 1, 1913, 544, of whom 329 Germans. There is one Protestant and one Roman Catholic mission. Imports and exports increased from 2,826,000 and 1,770,000 marks respectively in 1907, to 3,462,000 and 3,534,000 in 1910, 4,066,000 and 4,390,000 in 1911, 4,994,000 and 5,045,000 in 1912, and 5,676,000 and 5,339,000 in 1913. The chief export is copra, valued at 4,070,000 marks in 1912 and 4,121,000 in 1913; next is cacao, 840,000 and 1,063,000. Imports from and exports to Germany in 1912, 986,000 and 2,536,000; in 1913, 1,199,000 and 2,973,000. Local revenue in 1912-13, 970,000 marks; in 1913-14, 1,190,000; expenditure, 1,130,000 and 1,138,000. The budget for 1914-15 balanced at 1,374,354 marks. The administrative headquarters is Apia, in Upolu.

In 1914 German Samoa was occupied by British Colonial troops. See 1914 YEAR BOOK.

GERMAN SOUTHWEST AFRICA. A protectorate of Germany on the Atlantic, between Angola and the Cape Province of the Union of South Africa (excepting Walfish Bay, which belongs to the Cape Province). Estimated area, 835,100 square kilometers (322,432 square miles), nearly equal to the combined area of Washington, Oregon, and California. Estimated native population, 81,000; other colored, 3000; whites, Jan. 1, 1913, 14,830, of whom 12,-

292 Germans. Missions, two Protestant and two Roman Catholic. Schools, 20, with 775 pupils; about 3000 persons are said to receive mission instruction. In 1912-13, 494 whites and 3194 natives were convicted in the courts. The military in 1914 numbered 1967 Germans and 589 natives; police, 516 and 370. The Germans, who established the protectorate in 1884, have met with much vigorous resistance from the natives. Stock raising exceeds agriculture in importance. The number of cattle increased from 73,331 in 1908 to 121,139 in 1910, 171,784 in 1912, and 205,643 in 1913. In the latter year there were also 53,691 wool sheep, 17,171 Persian sheep, 11,194 karakul, 472,585 mutton sheep, 485,401 goats, 31,503 Angora goats, 15,916 horses, 13,618 mules and asses, 7772 swine, 709 camels, and 1507 ostriches. Copper is mined and, in the neighborhood of Lüderitzbucht, diamonds are found in considerable quantities. The diamond output in 1910-11 was 814,322 carats, and in 1911-12, 766,465 carats. Imports and exports have been valued as follows: in 1907, 32,396,000 and 1,616,000 marks; in 1910, 44,344,000 and 34,692,000; in 1912, 32,499,000 and 39,035,000; in 1913, 43,426,000 and 70,302,000. Diamond export in 1912 and 1913, 30,414,000 and 58,910,000 marks; copper ore, 6,523,000 and 7,929,000 (in metric tons, 42,775 and 47,345); tin ore, 9000 and 632,000 (in metric tons, 9 and 209); hides and skins, 298,000 and 521,000; wool, 150,000 and 136,000; ostrich plumes, 97,000 and 125,000. Imports from and exports to Germany in 1911, 37,259,000 and 24,360,000 marks; in 1912, 26,442,000 and 32,454,000. The length of railway in operation increased from 20 kilometers in 1897 to 194 in 1900, 631 in 1905, 1598 in 1909, and 2104 (1307 miles) in 1912. Soon after the outbreak of the great war in 1914 the British decided for military purposes to connect the railway systems of the Union of South Africa and German Southwest Africa. The connecting line, completed in 1915, is 314 miles long, extending from Prieska, on the Orange River in the Cape Province, along the south bank of the river to a point opposite Upington, where the river is crossed; from Upington the line runs to Nakob and thence west to Kalkfontein, terminus of the railway from Lüderitzbucht.

Local revenue in 1912-13 and 1913-14, 31,910,000 and 23,500,000 marks; expenditure, 46,570,000 and 40,340,000; in addition, there were loans of 15,950,000 and 7,481,000 marks. The budget for 1914-15 balanced at 47,820,000 marks, estimated local receipts amounting to 28,199,000 marks, imperial contribution 12,140,000, and loan 7,481,000. Windhuk is the administrative headquarters.

HISTORY. Shortly after the outbreak of the war in 1914, the forces of the Union of South Africa under General Louis Botha began an invasion of German Southwest Africa. Two divisions of the Boer troops landed at Walfish and Lüderitz Bays and began to advance by rail from these points, while a third concentrated its strength in Northern Cape Colony and advanced northward. On Christmas Day (1914), Walfish Bay, which had been raided by the Germans in September, was reoccupied by the troops of the Union. The first action to take place in the new year was on January 5th, when the invading forces occupied Scuit Drift, a crossing place on the Orange River between South Africa and

German Southwest Africa. A week later another crossing place, Raman's Drift, was taken by the Boers. On January 14th, Swakopmund, the principal port of the Protectorate, was occupied. From this time the invasion proceeded rapidly. Town after town fell into the hands of the invaders. Early in February the Germans retaliated by attacking the South African town of Kakamas, but their attack was repulsed. The Union forces next occupied Garub, 70 miles inland from Lüderitz Bay, then Davignab, Nababas, Heiragobias, Ukamas, Jerusalem, and Velloor. On the last day of March, Aus, the southernmost port of the Protectorate, about 100 miles from Lüderitz Bay, was captured by the Boers. Following the occupation of Aus, the invaders took possession of Warmbad, the southern capital of the Colony, Kalkfontein and Kanus, important railway stations, Seeheim, Keetmanshoop, and Bethany. Kubas was taken without any fighting on May 1st, and Otyimbingue was occupied the following day. By May 6th, General Botha was in possession of Karibib, Johann Albrechtshohe, and Wilhelmstal, and on the 12th of the month he entered Windhuk, the capital of German Southwest Africa. Here the powerful wireless station of the Germans was captured. The capture of the capital meant the downfall of the Protectorate, but for some time the Germans continued to offer resistance. On June 21st General Botha occupied Omaruru, an important railroad station on the Swakopmund Railway, 80 miles northwest from Windhuk; several days later he captured Kalkfeld, 40 miles further north. Otjivarango and Okandyande were taken in the last days of the month. Okaputu was occupied on June 30th and Otavi on July 1st. The final stand of the Germans was made at Tsumeb. When this place fell on July 8th, the Protectorate was ready to surrender. The actual surrender was made on July 9th. By the terms of the agreement:

(1) The military forces of the Protectorate were surrendered by his Excellency Governor Seitz to the Right Honorable Louis Botha, Commandant-in-Chief of the forces of the Union.

(2) Officers of the army of the Protectorate were to be allowed to keep their arms after giving their parole.

(3) The active troops of the Protectorate were to be interned under such guard as the Union saw fit to propose.

(4) All reservists were allowed to return to their homes after giving their parole.

(5) All reservists among the prisoners were to be allowed to return home after giving their parole.

(6) All officers among the reservists were to be allowed to retain their arms after giving their parole.

(7) All officers of the active forces were to be allowed to keep their mounts.

(8) All police of the Protectorate who had been acting in the capacity of soldiers were to be treated as such. Those acting in distant parts of the Protectorate were to be allowed to remain until such time as they could be replaced by the Union.

(9) Civil officers of the Protectorate were to be allowed to remain in their home after giving their parole.

(10) All war material, except the arms re-

tained by the officers, were to be placed at the disposal of the Union.

(11) Civil and military officials were to be appointed to keep a record of all property handed over to them.

The surrender of the Protectorate was speedily followed by the submission of the scattered German forces still remaining under arms in Damaraland and in remoter districts, so that by the end of July, the entire territory of German Southwest Africa was in the control of the Boer forces. See also WAR OF THE NATIONS, Africa.

GERMANY. The German Empire, officially *das Deutsche Reich*, a constitutional monarchy, consists of 25 federated states and an Imperial territory (Reichsland). Capital, Berlin.

AREA AND POPULATION. The area is officially stated at 540,857.5 square kilometers, equivalent to 208,825.2 square miles. This area is only slightly greater than that of France, 207,129 square miles, and is about the same as the combined areas of Nevada and Wyoming, 208,604 square miles, or of Maine, New Hampshire, Vermont, Massachusetts, Connecticut, New York, New Jersey, Pennsylvania, and Ohio, 208,770 square miles. The area in square miles, and the population according to the census of Dec. 1, 1900, and the census of Dec. 1, 1910, are shown by states in the following table (*k* kingdom, *g* grand duchy, *d* duchy, *p* principality, *fc* free city, *r* Reichsland); under Prussia are shown the constituent provinces and territory of Hohenzollern, and under Bavaria are shown Bavaria proper (that is, the eastern part) and the detached Palatinate (west of the Rhine).

	Sq. m.	Pop. 1900	Pop. 1910
Prussia (<i>k</i>)	134,663.9	34,472,509	40,165,219

Hamburg (fc)	160.0	768,849	1,014,664
Alsace-Lorraine (r)	5,606.9	1,719,470	1,874,014
Total	208,825.2	56,867,178	64,925,998

POPULATION TOTALS OF THE EMPIRE IN FORMER YEARS				
Total	1905	60,641,489	1860	37,747,000
Total	1900	56,867,178	1850	35,897,000
Total	1890	49,428,470	1840	32,787,000
Total	1880	45,284,061	1830	29,520,000
Total	1871	41,058,792	1820	26,294,000
Total	1870	40,818,000	1816	24,838,000

The population totals for former years given above are comparable, since they relate to the Empire as constituted at present. The increase from 1871 to 1880 amounted to about 10.8 per cent; from 1880 to 1890, 8.9; from 1890 to 1900, 13.1; from 1900 to 1910, 14.1; from 1871 to 1910, 58.1. The average density per square mile in 1871 was about 197, and in 1910 about 311.

The estimated population of the Empire, and of the customs territory (Zollgebiet) respectively, on June 30, 1912, was 66,146,000 and 66,391,000; on June 30, 1913, 66,978,000 and 67,225,000; on June 30, 1914, 67,810,000 and 68,059,000.

The 1910 census returned 32,040,166 males and 32,885,827 females. The number of males 18 years old and over was 18,947,561, and of females, 19,906,644. In view of the war, it is interesting to note the number of males returned by the 1910 census as having been born between the years 1879 and 1894 inclusive, that is, the number of males who, barring deaths from Dec. 31, 1910, would have been from 20 to 35 years of age in 1914; this number was 6,305,901. Males born in the years 1874 to 1878 inclusive, that is, males, who, barring deaths, would have been from 36 to 40 years of age in 1914, numbered 2,345,218. Males born in 1895 and 1896 numbered 1,329,903 at the 1910 census. Thus the number of males who, barring deaths from the end of 1910, would have been from 18 to 40 years of age in 1914 was 9,981,022. Of the total population in 1910, unmarried males and unmarried females numbered 19,516,340 and 18,591,604 respectively; married, 11,608,028 and 11,621,685; widowed, 866,676 and 2,583,872; divorced or separated, 49,122 and 88,666.

The 1900 census showed a foreign population of 778,737, of whom 314,463 female; the 1910 census, 1,259,880, of whom 542,991 female. Of the total in 1910, Austrians numbered 634,989, Dutch 144,181, Russians (including Finns) 137,668, Italians 104,265, Swiss 68,233, Hungarians 32,087, Danes 26,238, French (including colonials) 19,137, British (including colonials) 18,319, Americans (including Filipinos, Porto Ricans, and Hawaiians) 17,555, Luxemburgois 14,356, Belgians 13,449.

The increase in population is largely urban. Communes having less than 2000 inhabitants are regarded as rural. The aggregate population of such communes in 1871 was 63.9 per cent of the total; in 1890, 53.0 per cent; in 1900, 45.6 per cent; in 1910, 40.0 per cent. The aggregate population of communes having 100,000 or more inhabitants in 1871 was 4.8 per cent of the total; in 1890, 12.1; in 1900, 16.2; in 1910, 21.3. On Dec. 1, 1910, there were 576 communes with over 10,000 inhabitants each. The communal population of the

larger cities at that time was as follows (some of the figures are larger than the returns of the census, having been adjusted so as to include certain districts subsequently annexed): Berlin, 2,071,257 (Greater Berlin, 3,710,000); Hamburg, 932,116; Leipzig, 626,287; Munich, 607,592; Dresden, 551,697; Cologne, 516,527; Breslau, 514,765; Frankfurt on the Main, 414,576; Düsseldorf, 358,728; Nuremberg, 333,142; Charlottenburg, 305,978; Hanover, 302,375; Essen, 294,653; Chemnitz, 287,807; Stuttgart, 286,218; Magdeburg, 279,629; Bremen, 247,437; Königsberg, 245,994; Stettin, 237,419; Neukölln (formerly Rixdorf), 237,289; Duisburg, 229,483; Dortmund, 214,226; Kiel, 211,627; Mannheim, 206,049; Halle, 180,843; Strassburg, 178,891; Berlin-Schöneberg, 172,823; Altona, 172,628; Danzig, 170,337; Elberfeld, 170,195; Gelsenkirchen, 169,513; Barmen, 169,214; Posen, 156,691; Aachen (Aix-la-Chapelle), 156,143; Cassel, 153,196; Brunswick, 143,552; Augsburg, 143,128; Bochum, 136,931; Karlsruhe, 134,313; Lichtenberg, 133,141; Krefeld, 129,406; Erfurt, 123,548; Plauen, 121,272; Mainz, 118,107; Mülheim on the Ruhr, 112,580; Berlin-Wilmersdorf, 109,716; Lübeck, 109,106; Wiesbaden, 109,002; Saarbrücken, 105,089; Mülhausen (in Alsace), 105,448; Hamborn, 101,703; Münster (in Westphalia), 90,254; Oberhausen, 89,900.

Of the total population at the 1910 census, about 61.6 per cent was returned as Evangelical and 36.7 per cent as Roman Catholic, as compared with 62.5 per cent and 36.1 per cent in 1900. In 1910, Evangelicals numbered 39,991,421, Roman Catholics 23,821,453, other Christians 283,946, Jews 615,021, others 214,152. The following table shows, according to the 1910 census, the number of Evangelicals (*E.*), of Roman Catholics (*R. C.*), of other Christians (*O. C.*), and of Jews (*J.*), per thousand inhabitants:

	<i>E.</i>	<i>R. C.</i>	<i>O. C.</i>	<i>J.</i>

From 1906 to 1913 (the latest year for which vital statistics are available), a decline is noticeable in the marriage rate, the birth rate, and the death rate. In 1912 and 1913 respectively, marriages numbered 523,491 and 513,283; births (including stillbirths), 1,925,883 and 1,894,598; deaths (including stillbirths),

1,085,996 and 1,060,798; excess of births, 839,887 and 833,800; living births, 1,869,636 and 1,838,750. The following table shows for each 1000 inhabitants: *m* the number of marriages; *b* births (including stillbirths); *d* deaths (including stillbirths); *e* excess of births over deaths; *l* living births; and for each 100 births: *i* the number of illegitimate births; *s* the number of stillbirths:

	<i>m</i>	<i>b</i>	<i>d</i>	<i>e</i>	<i>l</i>	<i>i</i>	<i>s</i>

1913	7.7	28.3	15.8	12.4	27.5	9.7	2.9

* For the ten-year periods, the annual average is shown.

In 1895 German overseas emigrants numbered 37,498, and foreign emigrants from German ports, 95,074; in 1900, 22,309 and 160,129; in 1905, 28,075 and 284,787; in 1910, 25,531 and 254,618; in 1911, 22,690 and 183,233; in 1912, 18,545 and 290,386; in 1913, 25,843 and 413,857; in 1914, 11,803 and 150,416. Of the German emigrants in 1914, 9614 were bound for the United States, 77 for Brazil, 1821 for other American countries, 232 for Australia, 8 for Africa. Of the foreign emigrants from German ports in 1914, 131,938 were bound for the United States, 16,077 for other American countries, 2075 for the United Kingdom, 223 for Africa.

EDUCATION. Higher schools for males numbered, in 1911, 1687, with 22,941 teachers and 427,644 students; for females, 828, with 3012 male teachers, 9386 female teachers, and 234,461 students (not including 2051 boys under instruction at the girls' schools). Included in the higher schools for males were: 534 gymnasia, with 9769 teachers and 160,237 students; 223 realgymnasia, with 3708 teachers and 70,357 students; 167 oberrealschulen, with 3473 teachers and 75,832 students; 81 progymnasia, with 570 teachers and 9509 students; 63 prorealgymnasia, with 384 teachers and 7252 students; and 411 realschulen, with 4265 teachers and 89,968 students. Of the higher schools for females, 39 were gymnasia, with 432 male teachers, 607 female teachers, and 22,137 students. There are numerous institutions for higher, technical, and professional instruction. Degree-conferring technical high schools number 11, at Aachen, Berlin, Breslau, Brunswick, Danzig, Dresden, Hanover, Karlsruhe, Munich, and Stuttgart. These technical high schools, in the winter semester of 1913-14, had 11,594 regular students, while the total enrollment, including attendants upon lectures, etc., was 16,871, of whom 1877 were females. In the winter semester of 1914-15, regular students numbered 9725, and the total enrollment was 11,722, of whom 842 were females. Lyceums, with faculties of philosophy and Roman Catholic theology, are established at Bamberg, Brunswick (academy), Dillingen, Eichstätt, Freising, Passau, and Regensburg; these had, in the winter semester of 1914-15, 847 regular students, and a total enrollment of 957, of whom 26 were females. The 21 univer-

sities, together with the Kaiser-Wilhelm Academy at Berlin, and the Posen Academy, had, in the winter semester of 1912-13, 59,312 matriculated students (including 3213 females), and a total enrollment of 69,277 (including 5316 females); in the winter semester of 1913-14, 60,095 matriculated students (3686 females), and a total enrollment of 70,024 (5518 females); in the winter semester of 1914-15, 53,074 matriculated students (3896 females), and a total enrollment of 56,644 (4842 females). The first semester of the newly established University of Frankfurt on the Main, was that of the winter 1914-15; the number of the students is included in the total just given. The decline in attendance at the technical high schools and universities is to be noted as one of the results of the war. The following table shows for the several universities the number of matriculated students and the total enrollment in the winter semesters of 1913-14 and of 1914-15:

	1913-14		1914-15	
	Matric.	Total	Matric.	Total
Berlin	9,593	14,211	8,085	9,308
Kaiser-Wilhelm Academy	494	494	504	504
Bonn	4,270	4,550	4,357	4,481
Breslau	2,791	3,280	2,709	3,000
Frankfort on the Main			618	1,009
Göttingen	2,815	2,941	2,263	2,814
Greifswald	1,250	1,899	1,109	1,151
Halle	2,910	3,108	2,312	2,359
Kiel	1,847	1,923	1,941	1,971
Königsberg	1,568	1,675	1,260	1,281
Marburg	2,168	2,217	2,049	2,062
Münster	2,123	2,297	2,361	2,456
Posen (Academy)		830		163
Munich	6,802	7,664	5,539	5,833
Würzburg	1,515	1,586	1,208	1,227
Erlangen	1,341	1,388	1,118	1,186
Leipzig	5,532	6,463	4,515	4,933
Tübingen	1,887	2,013	2,056	2,114
Heidelberg	2,409	2,567	2,028	2,091
Freiburg in Breisgau	2,572	2,710	2,237	2,276
Gießen	1,340	1,514	1,214	1,248
Jena	1,862	1,944	1,166	1,708
Rostock	814	1,009	820	839
Strassburg	2,092	2,241	1,155	1,180
Total	60,095	70,024	53,074	56,644

In the winter semester of 1914-15, the number of matriculated university students in the several faculties was as follows: Evangelical theology, 4018 (including 12 females); Roman Catholic theology, 1888; law, 8561 (including 71 females); medicine, 15,149 (985); philosophy (including science, etc.), 22,419 (2739). The theological faculties at Münster, Munich, Würzburg, and Freiburg are Roman Catholic; at Bonn, Breslau, Tübingen, and Strassburg, there are both Roman Catholic and Evangelical theological faculties; at the other universities, the theological faculties are Evangelical. There are many institutions, in addition to those mentioned, for technical and special instruction.

AGRICULTURE. The total area of Germany is stated at 54,085,760 hectares. So-called farm land in 1907 (the latest year for which statistics are available) comprised 43,106,486 hectares. Of this land 31,834,874 hectares (73.9 per cent) were under cultivation, 7,679,754 hectares (17.8 per cent) were profitable forest, and 3,591,858 hectares (8.3 per cent) were poor pasture, waste lands, yards, etc. Land under cultivation consisted of arable land, 24,432,354 hectares (56.7 per cent of the total farm land); meadows and sown pastures, 6,805,436 hectares (15.8 per cent); gardens, 481,716 hectares (1.1 per cent); and vineyards, 115,368 hectares (0.3

per cent). As compared with 1895, the year 1907 showed an increase in waste and forest land and a slight decrease in cultivated land. In 1907, about 28 per cent of the population were supported by agriculture, as compared with about 35 per cent in 1895.

For some of the principal crops, the area, in thousands of hectares, and the yield, in metric tons, are reported as follows:

	1000 hectares			Metric tons	
	1912	1913	1914	1913	1914
Wheat	1,925	1,974	1,996	4,655,956	3,971,995
Rye	6,268	6,414	6,299	12,222,394	10,426,718
Barley	1,590	1,654	1,582	3,673,254	3,187,983
Oats	4,387	4,438	4,388	9,713,965	9,038,185
Potatoes	3,342	3,412	3,386	54,121,146	45,569,559

On account of the war, figures for the 1915 crops are not available. In 1913, about 533,000 hectares were planted to sugar beets, yielding 16,939,979 metric tons; in 1914, 569,082 hectares, 16,918,782 metric tons. The output of raw sugar in 1913 was 2,706,327 metric tons; in 1914, 2,617,938 (provisional figure). In 1913 and 1914 respectively, 27,048 and 27,685 hectares were under hops; yield, 106,179 and 232,366 metric quintals. The average yield of hops in 1905-14 was 192,307 quintals. The area under vines is gradually declining, from 119,873 hectares in 1904 to 105,876 in 1913, and 102,855 in 1914; the yield varies greatly, having been 7.5 hectolitres per hectare in 1910, 26.6 in 1911, 18.6 in 1912, and 9.5 in 1913. The total yield of wine in the latter year was 1,004,947 hectolitres. The average yield in 1905-9 was 2,628.034 hectolitres.

Live stock has been enumerated as follows on December 1st, the figures for horses not including those used in the army and the 1914 figures being provisional:

	1904	1913	1914
Horses	4,267,403		3,441,307
Cattle	10,456,187	11,320,460	11,316,457
Sheep	7,907,173	5,520,837	5,451,570
Swine	18,920,666	25,659,140	25,339,850
Goats	3,329,881	3,548,884	3,534,327

FISHERIES. Fishing in 1914 was interrupted by the war, and statistics for that year have not been issued. The value of the North Sea catch in 1912 and 1913 respectively was: fish, 21,241,700 marks and 21,857,200 marks; shellfish, 798,400 and 962,200; other marine animals, 6700 and 5700; salt herring and other fishery products, 8,937,800 and 11,786,100; total, 30,984,600 and 34,811,200. Value of the Baltic catch, including that of the bays (Stettiner Haff, etc.), in 1912 and 1913: fish, 10,554,500 marks and 10,341,100 marks; shellfish, 2900 and 6100; other animals regarded as marine (chiefly wild ducks), 24,700 and 31,000; total, 10,582,100 and 10,378,200. Total value of North Sea and Baltic catches in 1912 and 1913, 41,566,700 and 44,989,400 marks.

MINERALS AND METALS. The output of the grand duchy of Luxemburg is included in the statistics of Germany. The value of the mineral output in 1912 is stated at 2369 million marks, as compared with 2086 million in 1911, and 2009 million in 1910. The production of the principal minerals in 1912 and 1913 are reported as follows, in thousands of metric tons: coal, 174,875 and 190,109; lignite, 80,935 and

87,233; iron ore, 27,200 and 28,608; zinc ore, 644 and 642; lead ore, 143 and 110; copper ore, 974 and 948; rock salt, 1296 and 1392; potassium salts, 11,161 and 13,306. The output of pig iron in 1911 and 1912 is reported at 15,574,039 and 15,220,900 metric tons respectively; zinc, 243,784 and 313,600; lead, 161,450 and 165,000; copper, 37,455 and 45,500; tin, 12,426 and 10,600; sulphuric acid, 1,724,081 and 1,649,700. For 1913, the total output of pig iron was reported at 19,291,920 metric tons; for 1914, 14,389,547.

COMMERCE. The German customs territory includes the grand duchy of Luxemburg. On account of the war, commercial statistics for 1914 have not been published. For 1913 and preceding years, total foreign commerce, except goods in transit, is shown below, in millions of marks:

	1910	1911	1912	1913
Imports:				
Merchandise	9,585.1	10,380.0	11,572.4	11,654.8
Coin and bullion . .	555.0	297.3	327.4	441.3
Total	10,090.1	10,677.3	11,899.8	12,096.1
Exports:				
Merchandise	9,535.1	10,880.0	11,572.4	11,654.8
Coin and bullion . .	352.9	118.3	142.9	102.8
Total	8,432.6	8,892.2	9,827.1	10,994.6

Imports for consumption and exports of German produce have been valued as follows, in millions of marks:

	1910	1911	1912	1913
Imports:				
Merchandise	8,934.1	9,705.7	10,691.8	10,769.7
Coin and bullion . .	375.9	301.3	325.7	436.4
Total	9,310.0	10,007.0	11,017.5	11,206.1
Exports:				
Merchandise	7,474.7	8,106.1	8,956.8	10,097.2
Coin and bullion . .	169.5	118.3	142.7	101.4
Total	7,644.2	8,224.4	9,099.5	10,198.6

In 1912 and 1913, imports and exports of merchandise, special trade, were valued by great classes as follows, in millions of marks:

	Imports		Exports	
	1912	1913	1912	1913
Raw materials . . .	4,823.2	5,003.0	1,382.4	1,518.1
Partly mfd.	1,256.8	1,239.0	1,012.9	1,139.4
Manufactures . . .	1,410.9	1,487.8	5,763.2	6,896.8
Food substances . .	2,944.9	1,759.2	789.4	1,036.0
Live animals . . .	256.0	289.7	8.9	7.4
Total	10,691.8	10,769.7	8,956.8	10,097.2

For 1912 and 1913 respectively, the values in millions of marks, of the principal imports of merchandise for consumption, were as follows: cereals, 1130.5 and 1037.0; hides and skins, 575.5 and 672.4; cotton, 623.6 and 664.1; wool, 527.0 and 511.7; chemicals and drugs, 395.4 and 421.8; copper, 320.0 and 346.7; timber, lumber, etc., 355.5 and 325.5; live animals, 252.9 and 201.6; coal, 275.7 and 280.6; iron, 213.3 and 238.3; copra, coconuts, etc., 195.3 and 225.9; coffee, 252.7 and 219.7; silk, 229.9 and 193.3; eggs, 187.5 and 188.2; fruits, 126.0 and 148.8; rubber and gutta-percha, 184.2 and 146.1; fish, 126.5 and 135.9; leaf tobacco, 135.6 and 134.3; wheat products, 186.8 and 130.3; linseed, 104.8 and 129.7; animal fats, 111.2 and 118.9; butter, 126.3 and 118.7; oilcake, 116.5

and 118.6; cotton yarn, 104.0 and 116.2; flax and hemp, 120.4 and 114.4; woolen yarn, 107.6 and 108.0; rice, 102.6 and 103.9; southern fruits, 94.2 and 101.2; tin, 107.2 and 101.1; jute, 74.7 and 94.0; iron manufactures, 97.9 and 93.7; meats, 84.8 and 81.4; machinery 77.1 and 80.4.

For 1912 and 1913 respectively, the values, in millions of marks, of the principal exports of domestic produce were as follows: iron manufactures, 1185.8 and 1337.6; coal, 611.9 and 722.6; machinery, 630.3 and 680.3; chemicals and drugs, 546.4 and 658.0; cotton goods, 421.6 and 446.5; cereals, 341.6 and 278.2; paints, dyes, colors, etc., 278.2 and 298.1; electrical apparatus, 239.7 and 290.3; woolen goods, 253.4 and 270.9; sugar, 132.2 and 266.6; paper, 232.2 and 262.8; leather, 230.1 and 242.9; copper manufactures, 184.7 and 240.7; silk goods, 205.2 and 219.5; furs, etc., 182.2 and 193.8; hides and skins, 182.3 and 178.4; ships, 155.9 and 175.2; woolen yarn, 84.2 and 166.3; glass and glassware, 119.5 and 146.1; apparel, 118.3 and 132.0; rubber manufactures, 120.5 and 128.3; leather manufactures, 98.1 and 114.2; pottery, 102.0 and 112.8.

The value of imports of merchandise for consumption and of exports of domestic produce by countries in 1912 and 1913 was as follows, in millions of marks:

	Imports		Exports	
	1912	1913	1912	1913
United States	1,586.0	1,711.5	697.6	713.2
Russia	1,527.9	1,424.6	679.8	880.0
United Kingdom	842.6	876.1	1,161.1	1,438.2
Austria-Hungary	830.0	827.3	1,035.3	1,104.8
France	552.2	584.2	689.4	789.9
British India	533.3	541.8	107.5	150.7
Argentina	444.9	494.5	239.4	265.9
Belgium	386.6	344.6	493.3	551.0
Netherlands	345.4	338.0	608.5	693.5
Italy	304.6	317.7	401.2	393.5
Australia	276.7	296.1	87.6	88.5
Brazil	313.2	247.9	192.8	199.8
Du. E. Indies	214.9	227.6	74.5	98.6
Sweden	214.0	224.1	197.4	229.8
Switzerland	205.7	213.3	520.5	536.1
Chile	209.7	199.8	112.0	97.8
Spain	189.8	198.7	113.0	143.0
Denmark	202.2	191.9	254.2	283.9
Br. W. Africa	118.6	134.5	15.2	16.7
China	115.6	130.0	81.7	122.8
Egypt	117.7	118.4	88.0	43.4
Norway	63.9	82.0	144.7	161.7
Rumania	138.2	79.8	131.7	140.0
Turkey	77.8	73.9	113.2	98.4
U. of S. Africa	67.2	69.6	44.5	46.9
Br. N. America	58.1	64.1	54.3	60.5
Japan	43.1	46.6	110.6	122.7
Finland	36.9	45.2	83.4	97.5

Total including other 10,691.8 10,769.7 8,956.8 10,097.2

By Imperial orders dated July 31, 1914, the export of wheat, wheat flour, rye, barley, oats, maize, rice, and cotton from that date, and of linseed from August 19th, was prohibited. Exceptions might be granted.

SHIPPING. Number and registered tonnage (metric) of vessels entered and cleared at the ports, in the foreign trade, in 1913:

	Vessels entered		Vessels cleared	
	No.	Tons	No.	Tons
German	89,829	21,281,342	90,456	21,276,587
Foreign	26,637	15,540,835	26,919	13,645,219
Total	116,466	36,822,177	117,375	34,921,806
1912	114,407	32,541,458	113,931	32,606,653
1903	90,829	20,886,048	91,510	20,978,515
1898	66,655	14,621,634	67,219	14,734,653

Number and tonnage of steam vessels included in the 1913 figures above:

	Vessels entered		Vessels cleared	
	No.	Tons	No.	Tons
German	59,900	18,596,837	60,392	18,618,425
Foreign	16,651	12,710,212	16,751	12,802,919
Total	76,551	31,307,049	77,143	31,421,344
1912	73,079	29,001,122	74,025	29,046,505
1908	53,362	18,268,823	53,574	18,348,669
1898	31,032	12,406,770	31,189	12,482,780

Of the foreign shipping entered in 1913, British vessels numbered 5285, of 6,178,714 tons; Swedish, 5931, of 2,172,577 tons; Danish, 8101, of 1,703,232 tons; Norwegian, 2184, of 1,356,681 tons; Dutch, 3635, of 1,022,585 tons; Finnish, 512, of 207,215 tons; Russian, 517, of 197,031 tons.

Of the total in 1913 there were entered at Hamburg 14,054 vessels, of 13,141,362 tons; at Bremerhaven, 1803, of 2,298,689 tons; at Bremen, 3310, of 1,928,950 tons; at Stettin, 4900, of 1,893,434 tons; at Rostock (Warnemünde), 3423, of 1,409,908 tons; at Cuxhaven, 1777, of 1,305,900 tons; at Sassnitz, 3277, of 1,235,117 tons; at Lübeck, 4047, of 958,239 tons; at Neufahrwasser (Danzig), 2811, of 781,498 tons; at Emden, 1870, of 779,031 tons.

The table below shows the number of vessels, with their registered net tonnage, comprising Germany's merchant marine Jan. 1, 1914 (excluded are steamers of less than 15 tons and sail of less than 22 tons):

	Vessels		Of which, steam	
	No.	Tons	No.	Tons
Hamburg	1,466	1,908,279	822	1,640,828
Bremen	713	937,610	461	810,275
Prussia	2,329	3,18,646	687	251,924
Oldenburg	298	60,476	80	37,288
Lübeck	54	49,153	53	48,376
Mecklenburg-Schwerin	75	45,907	67	43,671
Recapitulation:				
North Sea	3,948	2,988,216	1,587	2,520,609
Baltic Sea	987	381,855	583	311,708
Total	4,935	3,320,071	2,170	2,832,312
1913	4,850	3,153,724	2,098	2,655,496
1912	4,732	3,023,725	2,009	2,518,666
1901	3,883	1,941,645	1,390	1,347,875

COMMUNICATIONS. The following table shows the length in kilometers of state and private normal-gauge railway in operation, together with the average number of kilometers of railway per thousand square kilometers of area, as officially reported for March 31, 1913:

	State	Private	Total	Aver.
Prussia	35,303.1	2,209.8	37,510.4	107.5
Bavaria	8,115.3	241.9	8,357.2	110.2
Saxony	2,656.4	20.2	2,676.6	178.5
Württemberg	1,811.1	162.5	1,973.6	102.2
Baden	1,856.0	235.7	2,091.7	138.8
Hesse	1,363.3	130.2	1,493.5	194.3
Mecklenburg-Schwerin	1,157.1	9.1	1,166.2	88.8
Saxe-Weimar	409.9	51.1	461.0	127.7
Mecklenburg-Strelitz	160.0	121.3	281.5	96.0
Oldenburg	644.1	40.8	684.9	106.5
Brunswick	439.5	208.3	647.8	176.4
Alsace-Lorraine	1,822.1	15.6	1,837.7	126.6
Total including other	57,505.7	3,653.1	61,158.8	118.1
1912	56,859	3,662	60,521	111.9
1911	56,062	3,701	59,762	110.5
1910	55,353	3,678	59,031	109.1
1905	50,514	4,166	54,680	100.9

* In addition 352.3 km. abroad, belonging to the German state railways.

Besides the normal-gauge railway shown in the foregoing table, there were in operation on March 31, 1913, 2218.5 kilometers of narrow-gauge railway, of which 1075.3 kilometers were state railway and 1143.2 kilometers private.

The railway service in Germany during 1915, and in the previous year, was handled under military conditions. The German government maintained a complete military organization of its railway lines, and construction was primarily for strategic purposes and military operations. From the time that war was declared on Aug. 2, 1914, the mobilization of the troops was effected rapidly by railway service which included not only the actual moving of military units, but also bringing men to their homes or appointed places, while at the same time a large number of tourists were transported to frontiers or elsewhere.

The early movements of the railway lines included the elimination of loading and unloading freight cars that were not needed for the transport of military material. The operation of troop trains began a few hours after the actual mobilization under the direction of the chief of the military railway organization and his staff, under whom all railways became immediately subject, as he was empowered to issue all orders for regulating the war traffic, and had at his disposal the railway sections of the great railway staff in Berlin. Germany's railway systems were soon augmented by the railways in the conquered territory, which had to be repaired in case of damage to track, and put in working order and connected with the German lines. The organization of the railway traffic in the conquered district was on a basis similar to the railway administration in Germany. Two military railway administrations were formed for this purpose. One of these had its headquarters at Aachen previous to proceeding to Belgium, and straightway the lines of the conquered district were repaired so rapidly that German rolling stock could be sent even as far as Louvain, filled with troops, and empty trains returned, even under fire. The second military administration was set up on Aug. 20, 1914, at Ulflingen, and gradually pushed forward, while railway commandos were established in Luxemburg, and in the East, at Lodz, to take care of the conquered districts of Russian Poland.

As was natural, the construction operations of the German railway troops consisted during the first months of the war in replacing tracks and restoring damaged railway buildings and other plants, or laying new lines where they were required by the military authorities. The nature of the operations required the construction of small field railways to bring up ammunition and provisions to the particular places where German troops were located, and these lines became increasingly important with the development of French fighting. Many of the bridges which were destroyed, and which had been temporarily repaired, were replaced by permanent structures, various tunnels were restored, and a large number of lines opened to traffic, this requiring in many cases the construction of stations and increased station facilities.

The German official report gave the following statistics for the operation of German military lines in Belgium and France for the month of April, 1915, the figures being approximate:

TRAFFIC IN THE CONQUERED RAILWAY TERRITORIES
(BELGIUM AND FRANCE) FOR THE MONTH OF
APRIL, 1915

(In round figures)

1. Distance in kilometers (kilometer=.621 mile) at the end of the month:			
	Single line	Double line	Total
A. Used by military...	3,000	4,100	7,100
B. Leased	450	150	600
C. Not in use	550	20	570
D. Not restored	90	29	110
E. Under construction.	400	15	415
Total	4,490	4,305	8,795

As a result of the war and the military operation of the railways, the usual train service in Germany was considerably reduced. The timetable itself showed a high percentage of trains withdrawn. The reduced service for the most part, however, carried on by employees over military age was very satisfactory and well organized. In many ticket offices women were employed, and the usual dining and sleeping cars were operated on the more important express trains between large cities. All the German railways were being worked on one single system, which was extended to the whole of Belgium under German occupation, as well as to the occupied portions of France and of Russian Poland. Direct express trains, with sleeping and dining cars, were run from Berlin to Metz-Charleville-Mezières, and also to Brussels and Lille, so that a civilian with proper official papers could travel to the occupied territory to the west to places as far as Noyon, Laon, and Chauny, just as he could travel eastward to Lodz.

The German military authorities, only 11 days after the capture of Warsaw, put on a Lille-Warsaw express train connecting the two extremes of occupied enemy territory, some 800 miles apart. This train left Lille at 6.40 A.M., Brussels at 8.30, Berlin at midnight, and arrived in Warsaw in time for luncheon the next afternoon. Late in the year the German railway administration issued the new time-tables for the Berlin-Munich-Constantinople trains. These were not to go through Belgrade, as the bridge over the Save and the Ripanj tunnel were still unusable, but were to follow the route Berlin-Munich-Budapest-Temesvár-Verschez, crossing the Danube at Semendria, and reaching Nish by a secondary line. Thence they would proceed to the Turkish capital.

The Imperial administration of ports and telegraphs embraces all the German states except Bavaria and Württemberg; these kingdoms operate, under certain limitations, their own postal and telegraph systems. In addition to the state telegraph lines, there are railway telegraph lines and some private lines. The following table relates to the year 1913 (the figures for the empire do not include those for Bavaria and Württemberg): *A* number of post offices; *B* state telegraph offices; *C* railway and private telegraph offices; *D* total telegraph offices; *E* length in kilometers of state telegraph lines; *F* length of state telegraph wire; *G* number of places (towns, etc.) having telephonic communication:

	Empire	Bavaria	Württemberg	Total
A	84,860	5,855	1,200	41,415
B	33,315	6,023	2,347	41,685
C	5,194	3,118	21	8,328

	Empire	Bavaria	Württemberg	Total
D	88,509	9,186	2,868	* 50,018
E	195,451	31,656	11,486	238,493
F	649,822	95,918	19,587	765,327
G	32,897	5,985	2,255	41,087

* Exclusive of 17 radiotelegraph stations and 213 on board ship.

FINANCE. The standard of value is gold. The monetary unit is the mark, whose par value is 23.821 cents. The Imperial revenue (ordinary, extraordinary, and total) for the fiscal years 1912 and 1913 and the estimates for 1914 (including supplementary estimates) and 1915 are reported as follows, in thousands of marks:

	1912	1913	1914	1915
Revenue:				
Ord.	2,827,194	3,194,399	3,405,178	3,823,081
Extr.	88,190	190,292	* 10,392,752	10,042,342
Total.	2,915,384	3,384,691	13,797,930	13,865,423
Expenditure:				
Ord.	2,707,865	3,403,034	3,405,178	3,323,081
Extr.	185,978	117,868	† 10,392,752	† 10,042,342
Total.	2,893,843	3,520,902	13,797,930	13,365,423

* The 1914 estimate was supplemented by war loans amounting to 10,000,000,000 marks, under laws of Aug. 4 and Dec. 8, 1914. † Extraordinary war expenditure was placed at 10,300,000,000 marks in the 1914 and 10,000,000,000 marks in the 1915 budget.

The larger ordinary expenditures in 1912 and 1913 respectively were: military administration, 684,182,900 and 747,047,100 marks; Imperial posts and telegraphs, 675,861,300 and 713,458,800 (revenue from Imperial posts and telegraphs, 792,870,500 and 833,314,600); debt, 225,471,200 and 239,391,300; naval administration, 183,676,900 and 204,426,300; pensions, 143,834,000 and 146,336,900; railway administration, 104,406,200 and 111,938,300 (revenue from railway administration, 155,105,000 and 153,580,200); general administration of finance, 97,031,500 and 107,473,400 (revenue from general administration of finance, which includes customs, stamps, etc., 1,792,751,000 and 2,095,196,200); interior department, 90,750,700 and 96,805,400.

The annual ordinary expenditures of the constituent states amount to a sum far larger than the Imperial expenditures; the latter are exceeded by those of Prussia alone.

The Imperial debt, as reported for Oct. 1, 1913, was 5,177,225,300 marks, of which the interest-bearing debt was 4,897,225,300 marks; the non-interest-bearing debt consisted of treasury bonds 160,000,000 marks and paper money 120,000,000 marks. The interest-bearing debt plus outstanding paper money has stood as follows (March 31st): 1880, 377,526,600 marks; 1890, 1,240,908,800; 1900, 2,418,517,700; 1905, 3,323,500,000; 1910, 5,013,500,000; 1912, 5,014,012,900; 1913, 4,925,796,200.

The interest-bearing debt of Prussia in 1913 was 9,901,769,100 marks; Bavaria, 2,285,976,100; Saxony, 861,109,900; Württemberg, 621,377,000; Baden, 586,355,500; Hesse, 434,632,400; Mecklenburg-Schwerin, 144,574,400; Saxe-Weimar, 2,222,600; Mecklenburg-Strelitz, 2,680,200; Oldenburg, 82,689,800; Brunswick, 43,763,800; Saxe-Meiningen, 7,287,800; Saxe-Altenburg, 882,700; Saxe-Coburg-Gotha, 6,004,600; Anhalt, 5,329,300; Schwarzburg-Sondershausen, 1,672,200; Schwartzburg-Rudolstadt, 4,560,200; Waldeck,

1,531,000; Reuss Elder Line, none; Reuss Younger Line, 1,040,600; Schaumburg-Lippe, 387,100; Lippe, 970,600; Lübeck (city and state), 74,906,300; Bremen (city and state), 299,766,400; Hamburg (city and state), 780,581,000; Alsace-Lorraine, 44,546,600.

ARMY. See **MILITARY PROGRESS**, *passim*.

NAVY. Authentic information is not available in regard to naval construction since the beginning of the war in 1914. The following summary is taken from a statement of the Office of Naval Intelligence at Washington and relates to July 1, 1914. Number and displacements of warships of 1500 or more tons, and of torpedo craft of 50 or more tons, built and building: Dreadnoughts (battleships having a main battery of all big guns, that is, 11 or more inches in calibre): built, 13, of 285,770 tons displacement; building, none. Coast-defense vessels, 2, of 8168 tons; building, none. Battle cruisers (armored cruisers having guns of largest calibre in main battery and capable of taking a place in line of battle with the battleships): built, 4, of 88,749 tons; building, 4, of 112,000 tons. Armored cruisers: built, 9, of 94,245 tons; building, none. Cruisers: built, 41, of 150,747 tons; building, 5, of 26,900 tons. Torpedo-boat destroyers: built, 130, of 67,094 tons; building, 24, of 14,400 tons. Torpedo boats, none built or building. Submarines: built, 27, of 14,140 tons; building, 18, of 14,400 tons. Total tonnage: built, 951,713; building, 354,864. Excluded from the foregoing: ships over 20 years old from date of launch, unless reconstructed and rearmed within five years; torpedo-boat destroyers over 15 years old; vessels not actually begun or ordered, although authorized; transports, colliers, repair ships, torpedo-depot ships, and other auxiliaries. After the outbreak of the war, the battle cruiser *Goeben* (22,640 tons) and the cruiser *Breslau* (4550 tons) were reported as sold to Turkey.

In the summer of 1914, the active personnel of the navy was reported at 79,197, including 2 admirals of the fleet, 6 admirals, 12 vice-admirals, 22 rear-admirals, 154 captains and commanders, 2220 other line officers, 340 medical officers, 276 pay officers, 162 naval constructors, 30 chaplains, 3183 warrant officers, 65,797 enlisted men, 177 marine officers, and 5791 marines. See also **NAVAL PROGRESS**.

GOVERNMENT. The empire is a federal state. Its constitution bears date of May 4, 1871, and was amended March 19, 1888. This instrument vests the executive authority in the King of Prussia as German Emperor; he is authorized to conclude treaties, to declare war (if defensive) and peace, and to appoint and receive diplomatic representatives. In 1915, the Emperor was William II, who was born Jan. 27, 1859, and succeeded his father (the Emperor Frederick III) June 15, 1888. The heir-apparent or Crown Prince is Prince Frederick William, born May 6, 1882.

The legislature consists of the Bundesrat, a federal Council (61 members appointed for each session of the governments of the several states), and the Reichstag (397 members elected for five years by direct manhood suffrage).

The Imperial ministers, or secretaries of state, do not form a ministry proper, but act independently of each other under the general supervision of the Imperial Chancellor. The Chancellor, who is the highest official of the empire

and president of the Bundesrat, is appointed by the Emperor without reference to the political majority in the Reichstag, and to the Emperor he is directly responsible. The Imperial Chancellor (and Prussian Prime Minister) in 1915 was Theobald von Bethmann-Hollweg (from July 14, 1909). Imperial secretaries of state in 1915: foreign affairs, Gottlieb von Jagow (he succeeded Alfred Kiderlin-Waechter, who died Dec. 30, 1912); interior, Klemens Delbrück (from July 14, 1909); marine, Grand Admiral Alfred von Tirpitz (from June 15, 1897); justice, Hermann Lisso (from Nov. 1, 1909); treasury, Karl Helfferich; posts and telegraphs, Reinhold Kraetke (from 1901); colonies, Wilhelm Solf (from Dec. 20, 1911).

HISTORY

THE FOOD SUPPLY. Considering that the ultimate issue of the war must depend in part at least upon the ability of the British navy to "starve Germany out" by cutting off the food supplies which had formerly been imported from abroad, vital importance attaches to the measures which the German government instituted for the conservation of the food supply in Germany. Soon after the outbreak of war maximum prices had been fixed for some commodities, like cereals and potatoes; but still the prices of food continued to rise, and the drastic action of the government was obviously demanded to correct two glaring abuses—the extravagance of consumers and the manipulation of the market by speculators—which manifestly aggravated the misery of the poorest classes and caused widespread discontent. In January, therefore, the government decided to lay its hands upon the food supply, to stop speculation, and to regulate consumption. To this effect ordinances were published in the *Reichsanzeiger* of January 25th, providing that all supplies of wheat or rye, pure or mixed, threshed or not, were to be confiscated and taken over from private individuals by the War Grain Association; at the same time all supplies of flour were to be taken charge of by the Communal Association in each town. In compensation, private owners would be paid the average price which prevailed between Jan. 1-15, 1915, except in cases where a maximum price had been fixed by the government. Dealers and trade mills would be permitted to handle half the amount of flour per month that they had sold from January 1-15. Bakers and confectioners were limited to three-fourths the amount they had been accustomed to use. The consumption of cereals was to be regulated under the general supervision of an Imperial Distributing Bureau, composed of 16 delegates to the Bundesrat, in addition to one representative of the German Agricultural Council, one representative of the German Commercial Congress, and one representative of the German Municipal Congress. While the Distributing Bureau in coöperation with the War Grain Association controlled the general distribution of the grain and flour supply, local consumption was to be regulated by Communal Associations, which would have the power to distribute flour to bakers, confectioners, and retailers, to determine the composition of bread, to prohibit the baking of cakes, to regulate the delivery of bread and flour by dealers, subject to the general principles of, and limited by the maxima

established by, the Distributing Bureau. The ordinance also contained a clause that foreign grain, if imported, could be sold only to the War Grain Association or to the Central Purchasing Association, or to the Communal Associations; but this provision was rescinded on February 6th. On the same day that the confiscation of grain and flour was decreed, January 25th, an order was issued obliging towns of over 5000 inhabitants to acquire and maintain a supply of preserved meat adequate to suffice for the needs of the population in case of emergency. In February, a further step was taken for the regulation of the bread supply. Each individual was given a "bread card" with coupons calling for 25, 50, and 100 grams of bread, enough amply to supply his or her needs for the week, but not to permit the purchase of a large supply for future use. The cards were to be presented and the appropriate number of coupons clipped, before bread could be purchased at restaurants, bakeries, or grocery stores. In this manner, by enforcing the strictest economy, the German government hoped to minimize the hardship occasioned by the shortage of food until the next harvest. It was anticipated that as time progressed, in case of a long-drawn-out war, the situation would become more instead of less favorable. Potatoes could be much more extensively cultivated and used to feed live stock as well as to supply the table. Grain hitherto used for the manufacture of starch or of alcohol could be saved for food. A yeast-process was invented that would help supply albuminous fodder. Instead of producing a surplus of rye and of beet sugar, Germany could raise more wheat and more beans and peas. Moreover, there were at least 33,000,000 acres of moorland which could be converted into valuable grainfields if men could be found to perform the labor and if sufficient quantities of fertilizer could be applied; and what with the invention of new fertilizers and the increasing number of prisoners of war (at the beginning of January there were 586,000 prisoners of war in Germany; in March, 810,000; at the end of July, 1,900,000), it began to appear that neither the fertilizers nor the labor would be lacking. See also **FOOD AND NUTRITION**.

EFFECT OF THE FOOD REGULATIONS. By the beginning of June, the effect of the regulation of the bread-supply had become apparent. On June 5th the Prussian minister of the interior announced that the bread problem was practically solved. There would even be a surplus of grain to carry over into the next harvest year, so that no anxiety need be felt if the coming harvest should not be extraordinarily plentiful. Moreover, and this was a most important result of Germany's military successes, grain and potatoes had been planted in large quantities in conquered territory, so as to relieve the pressure upon German agriculture. In August it was calculated that, thanks to the bread cards, and thanks to the increased supply of grain from conquered territory, the next year it would be possible to allow a very generous increase in the individual consumption of wheat and rye flour. Meantime, as the bread question became less pressing, the shortage of meat began to cause the gravest anxiety. In Berlin, May 29th, hotels were ordered to abolish *table-d'hôte* dinners, to encourage the use of more vegetables and less meat, to substitute boiled meat for roast meat

where possible, and to use fat and lard sparingly. To relieve the shortage of meat would not be so easy as to solve the bread question. The creation of an Imperial Fodder Board, to supply cattle, swine, and fowl raisers with oat, barley, and molasses substitutes for oat fodder, and the appointment of a certain number of days in the week when meat should not be eaten, were helpful measures but not complete solutions of the problem.

THE REICHSTAG IN MARCH. After eight months of the war, the Reichstag met again on March 10th for its third war session. The fear that Germany stood in immediate danger of being crushed by an iron ring of foes had by this time proved groundless; in its stead new problems had arisen, regarding the financial burden of a long and exhausting war, anticipating the political consequences of the war, and most of all respecting the economic crisis in Germany. In opening the session, the president of the Reichstag, Dr. Kaempf, declared: "Never can it be too frequently repeated that a people which is capable of such sacrifices, such devotion to the Fatherland, can not be conquered or destroyed. As the Almighty Lord of Hosts has thus far blessed our banners with victory, so also, we are sure, the final victory will be adjudged to our righteous cause. And on the bloody battlefields in the east and in the west, a lasting peace will be achieved, which will bring new blossoming, new might, and a new greatness to our beloved Fatherland." This was the key-note of the session. The first business on the programme was the budget. The Imperial secretary of the treasury, Dr. Helfferich, delivered his maiden speech as a government representative in the tribune of the Reichstag, clearly revealing in his lucid explanation of the financial situation the expertness he had acquired as director of the Deutsche Bank. A further war credit of 10,000,000,000 marks, to be raised by loan, was demanded and received the Reichstag's consent. Interest on the war debt, Dr. Helfferich insisted, should be met from current revenues; as for the rest, he cherished the hope "of being able to present the bill for our war expenditures to our enemies at the conclusion of peace." German financial conditions, the secretary asserted, were on a sounder basis than those of France or England. In spite of the loss of her external trade, worth over 20,000,000,000 marks a year, Germany was still able to endure. "As long as our own soil remains to us, no hunger and throttling policy will succeed in cutting off our necessities of life," he believed. Germany was determined to persevere, and at the end to demand "a reward of victory that is worthy of this huge sacrifice." Following Dr. Helfferich, Deputy Herr Haase, a Social Democrat, mounted the tribune to offer some trenchant criticism of the government. The right of free speech and the liberty of the press, said Herr Haase, had been arbitrarily and unjustifiably interfered with. Moreover, the government had been too reluctant to adopt the measures of government control which the Socialists had been indefatigably suggesting to give the people an adequate supply of food at a fair price. Food speculators should have been relentlessly prosecuted. War profits should be taxed. In conclusion the Socialist deputy delivered an eloquent plea for peace. "In all lands the horrors of war strengthen the desire to put

an end to the frightful butchery of nations. To express this desire is no sign of weakness and can least of all be so interpreted in our own case, for our military successes are incontestable, our economic life has developed in an amazing manner, and our finances have remained firm. It is the strongest who may first desire peace. My party as the representative of international Socialism has always been the party of peace, and it knows that the Socialists of other countries have the same idea. Our desire is for a lasting peace that will not contain within itself the germs of new entanglements and new dissension. It must be established that no nation may oppress another, and above all that all nations shall perceive their peaceful mission in the exchange of cultural goods." Against this peace manifesto an immediate protest was raised by Dr. Spahn in the name of all the other parties excepting the Poles, on the ground that it would "lead to misunderstandings abroad." "We are waging war," he continued, "not for the sake of war but for the sake of peace; but it must be a peace that more than hitherto will ensure the prosperous development of German labor and the German spirit of enterprise, and give the Fatherland a permanent guaranty and protection for its greatness. The achievement of this goal demands still more victorious battles." The Social Democrats continued to perturb the otherwise unruffled confidence of the Reichstag. Herr Schmidt, a Socialist from Berlin, called attention to the sufferings of the very poor. Millions of families, he said, had nothing to rely upon but their war allowance of 12 marks per month with 6 marks additional for every child. "How shall these families subsist," he asked, "when the loaf of bread that formerly cost 50 pfennigs in Berlin now costs 95, and the potatoes which used to sell for 3-3½ pfennigs a pound now have risen to 7-10 pfennigs? In the Rhine country the cost of living has increased even more." Another Socialist, Herr Ledebour, occasioned an uproar in the Reichstag by making a plea in behalf of the Poles, Danes, and Alsations and by denouncing the threat which the German military authorities had made, that for every German village in East Prussia destroyed by the Russians, three Russian villages in Poland would be destroyed by the Germans. Amidst vehement interruptions, the presiding officer of the Reichstag reminded the speaker that "criticism of the military authorities under the present circumstances during the war cannot be allowed." Dr. Karl Liebknecht (Socialist) was reprimanded for exclaiming "barbarism!" when Ledebour referred to the German threat regarding the burning of Polish villages. Representatives of the non-Socialist parties protested formally against the insult which had been uttered against the German General Staff. Even the Socialist group, or a majority of the group, speaking through its chairman, Herr Scheidemann, was constrained to disavow Herr Ledebour's remarks, and after a brief recess, Herr Scheidemann announced that, for the same reasons which had actuated them on Aug. 4 and Dec. 2, 1914, the Social Democrats this time would again vote for the budget. The final vote on the budget was therefore unanimous, with the exception of two rebellious Socialists, Liebknecht and Ruehle.

MAY SESSION OF THE REICHSTAG. The brief session of the Reichstag in May, concerned chiefly with the economic measures necessary to carry

on the war, gave new proof of the solidarity of the various parties. Only a few Socialists continued to oppose the war. The comment of the *Frankfurter Zeitung* is worth noting: "The great majority of the Social Democrats think and feel about this war just as does the rest of the German nation. That they have a passionate wish that a good peace should speedily follow the war, in no way differentiates them from the rest of the Germans. For all Germans would have preferred peace, and would rather see a speedy than a distant peace; but all know, also, that the possibility of peace does not depend on us alone, and that only such a peace is possible for Germany as will insure us against the danger of new wars for all time." As far as the demand of the Socialists for democratic reforms was concerned, the *Frankfurter Zeitung* observed that it would be impossible for everything to "slip back again into the old ways" after the war; that the German nation must be organized democratically if the splendid spirit of solidarity and fraternity that had manifested itself during the war was to be preserved, so that Germany could become a leader and a model for all nations.

THE CHANCELLOR'S SPEECH. The close of the May session was signalized by a great speech of Chancellor von Bethmann-Hollweg, May 28th. The German Chancellor in vehement terms denounced the infidelity of Italy (Italy had just declared war against Austria-Hungary; see article **WAR OF THE NATIONS, Italy's Entry into the War**). Without shedding a single drop of blood, Italy could have obtained, according to Von Bethmann-Hollweg, land in the Tyrol and on the Isonzo, "as far as the Italian language is spoken," "satisfaction of her national desires in Trieste," "a free hand in Albania," and the Albanian harbor of Valona. "Germany pledged her word that the concessions would be carried out. There was no ground for distrust." This reference to Germany's word of honor, after the events of August, 1914, called forth no little sarcastic comment from the Entente press. In defining Germany's position, the Chancellor hinted that the greater the odds that Germany had to fight, and the harder the combat, the greater would be the German determination to persevere "until we have won all possible real guarantees and assurances that none of our enemies, singly or in coalition, shall again hazard an armed conflict with us."

A YEAR OF THE WAR. On July 31st, after just one year of the war, the Emperor issued a proclamation "to the German people," reaffirming Germany's innocence in the striking words, "Before God and history my conscience is clear. I did not want the war." With pious gratification the Emperor declared "with grateful hearts we may say to-day: God was with us." As for the terms of peace, he referred to "military, political, and economic guarantees for the future" and "conditions for the unrestricted expansion of our creative energies at home and on the free seas." The newspapers, in summing up the results of the first year of the war, pointed out that Germany had won almost 2,000,000 prisoners (Russians, 1,518,000; French, 268,000; Serbians, 50,000; Belgians, 40,000; English, 24,000). To balance the loss of her colonies, she had conquered extensive territories in Europe, including 68 per cent of the coal resources of France, 90 per cent of her

iron ore, 68.7 per cent of her textile industry, and 43 per cent of her total industry. The supply of metals, cotton, and other raw materials in Germany had been seriously curtailed, so that it had been necessary to commandeer, February 1st, all supplies of copper, tin, aluminum, nickel, antimony, and lead for military purposes, thus crippling certain industries; nevertheless German industry was giving evidence of remarkable vitality. The great fair at Leipzig in the spring had furnished a magnificent display of German industries. The industrial region of Westphalia was described as a vast workshop, busy night and day, supplying the material equipment of war. Finally, the German press was not slow to boast that although German commerce had been temporarily driven from the seas, Germany's enemies had suffered more than three times as heavily, both in merchant- and in war-ships, comparing the tonnage of ships actually lost.

THE REICHSTAG IN AUGUST. The fifth war session of the Reichstag was convened on August 19th. The Imperial Chancellor, in a long review of the causes of the war, laid the guilt at the door of the Triple Entente, and blamed France for lending money to Russia for military preparations against Germany. England, he said, had suffered a severe blow to her self-confidence and her hypocrisy. "The myth that it was only on Belgium's account that she was waging war, England herself has abandoned." The claim of England to be the protector of the freedom of small nations was being disproved by her interference with the freedom of the seas, by her seizure of Greek islands in the Ægean, and by her attempts to involve Greece and Rumania in the war. "In Poland, where Russia is fighting with her allies for the freedom of nations, the entire country has been devastated by the retreating Russian armies. Villages were burned down, grainfields trampled under foot, and the population of entire communities, Jewish and Christian, sent into exile." "That is the way the Freedom and Civilization appear, for which our enemies fight." "We will continue this war," said Von Bethmann-Hollweg, "until the way will be clear for a new Europe, free from French conspiracies, from Muscovite lust for conquest, and from English tutelage." The Chancellor also made an important declaration respecting the future of Poland, that the Poles were to be "emancipated from the Russian yoke" and "given an opportunity to develop their national character." The declaration was so worded, however, that while it explicitly stated that the Poles were to be free from Russia, it left very vague the relationship which would exist between Poland and Germany. The day after Von Bethmann-Hollweg's speech, the secretary of the treasury came forward with a demand for another war credit of 10,000,000,000 marks. The credits previously voted had brought the total up to 20,000,000,000 marks, a sum equal to the value of the entire German railway system, including equipment and rolling stock. More was being spent in a single month than had been expended in the entire Franco-Prussian War. Germany's war cost was now approximately 70,000,000 marks a day, whereas England was called upon to supply 80,000,000 marks a day. Germany's superiority in financial strength was still asserting itself, he claimed. Following Dr. Helfferich's speech the various

parties in the Reichstag made brief declarations of policy. Dr. David, for the Social Democrats, hoped that war profits would be taxed, and that peace would come soon enough to render further war loans unnecessary. The food problem, he complained, had not yet received "a satisfactory solution." Concluding his remarks, the Socialist leader made a significant demand for democratic reform: "The might that gave us our interior strength cannot be employed by us except in the interest of freedom. Thus spoke the Imperial Chancellor. He was thinking about external policy. We, however, expect that internal freedom will not be denied us. Equal rights may not be denied to the great mass of the people. In this spirit we vote for the war credit." Herr Bassermann, in behalf of the National Liberals, heartily supported the government, and declared that the German Emperor was a Peace Emperor, until the war was forced on Germany and he was compelled to take the sword in self-defense. Herr Fischbeck, who spoke for the Progressive People's Party, approved the loan, but admitted ruefully that "our economic life has its gloomy side." The Conservative spokesman, Dr. Oertel, approved the loan and advocated vigorous measures against food speculation, generous support of the families of soldiers and crippled soldiers, and repeated the phrase that was coming to be stereotyped, "The magnitude of the reward of victory must correspond to the magnitude of the struggle." Dr. Spahn, for the Centre, signified approval of the loan. The Polish leader, Herr Seyda, referred with satisfaction to Bethmann-Hollweg's promise of freedom for the Polish people, and expressed the hope that the war would allow the "free development of the national life of the Polish people." Dr. Schultz, of the Empire Party, reiterated the Conservatives' declaration, that "our army and our entire nation desires a peace which will be worth the sacrifice, and we are confident that our statesmen will obtain for us the kind of a peace which the nation desires." The declarations of the parties in the Reichstag are cited, because they indicate the progress of the movement in favor of territorial conquests. It may be added, that the confidence of the wealthy and middle classes in the ultimate success of German arms received new and eloquent confirmation in the rapidity with which the third war loan was subscribed. The loan was offered to the public September 2nd. Within three weeks enough subscriptions had poured in to cover the loan, 10,000,000,000 marks, with 2,000,000 marks to spare. Nearly 45,000 depositors of the Berlin Savings Bank subscribed to the new loan, compared with 35,000 for the March loan. (For a discussion of the attitude of the Socialists in the Reichstag, see SOCIALISM.)

THE DEBATE ON PEACE TERMS. The discussion of the terms which Germany should demand at the conclusion of the war reached a climax in the historic Reichstag debate of December. The debate was opened by Dr. Scheidemann, spokesman of the Social Democrats, who interpellated the government on the subject of possible peace terms. Inasmuch as Germany had demonstrated her amazing strength and determination, as she unquestionably has done, she could now afford to make the first move in the direction of peace, certain that her desire for peace would not appear as weakness. In

reply to the Socialist interpellation, the Imperial Chancellor delivered a long speech, dwelling at length upon what he conceived to be the unutterable folly and hypocrisy of the Entente Powers. Pretending to fight for "the destruction of Prussian militarism" and for the freedom of small nations, the Entente Powers were really striving, and striving in vain, to dismember Germany and to advance their own selfish interests. But Germany was invincible. As for the terms upon which Germany would consent to make peace, he refused to go into detail. The Entente Powers, having been the ones to begin the war, must be the ones to ask for peace. As soon as they were ready to admit defeat, however, and to approach Germany with peace proposals "which are in consonance with Germany's dignity and security, we will always be ready to discuss them." While making this declaration as proof of Germany's love of peace, he warned the Quadruple Entente that "the longer and more bitterly they wage the war, the greater will be the necessary guarantees" which Germany would demand to prevent future attacks. Some intimation of what Germany would in any case demand was given by the following passage of Dr. von Bethmann-Hollweg's speech: "Neither in the west nor in the east must our enemies of to-day hold in their possession the entrance gates to our country through which they might attack or menace us anew. It is known that France gave loans to Russia only on condition that Russia strengthen her railways and fortresses in Poland against us; also that England and France regarded Belgium as their route of advance against us. Against this danger we must have military and political security. Also we must insure our economic development. . . . As regards the means to this end, we must reserve complete freedom of decision." From these vague sentences it might be inferred that Germany would take Poland from Russia, and Verdun and Belfort from France; Belgium might be annexed outright or placed under a sort of military and economic German protectorate; and Germany's economic future might be secured by annexing extensive colonies, or by restoring Egypt to Turkey and making the Turkish Empire a German sphere of economic exploitation, or by gaining control of Belgian seaports and mines, or by exacting huge indemnities from the vanquished Powers, or by forcing them to lower their tariff walls against German manufactures. In reference to the condition of the territories which had been occupied by German armies, the Chancellor had the most favorable reports to make. Belgium, he announced, was recovering from her injuries; Belgian commerce and industry were reviving, coal was being mined in considerable quantity, and instruction in the Flemish language had been made obligatory for all. As regards the conquered Russian territory, Dr. von Bethmann-Hollweg asserted that the German invaders found "terrible devastation" in Poland, Lithuania, and Courland. The Germans, however, had established new police forces, municipal administration, and legal and sanitary organization in the districts occupied by them. They had promoted economic activity, rebuilt railways, constructed roads, introduced "municipal statutes which give the people an interest in participating in public life." "The question of school teaching has everywhere been taken up,"

he said, and a university and a technical institute had been opened at Warsaw. "Never in history, when millions of men were opposed in a fight for life and death, has so much peaceful work been accomplished behind the front." At the conclusion of Dr. von Bethmann-Hollweg's address, the non-Socialist parties of the Reichstag united in declaring their satisfaction and in proclaiming that "in complete unity, with calm determination, and with confidence in God, we await the hour which will make possible peace negotiations whereby the military, economic, financial, and political interests of Germany will be permanently assured, to the most complete extent, and by all measures, including such annexations of territory as may be necessary for this purpose." The annexationist spirit, which had gradually increased in intensity and in popularity during the year, in December was seen to dominate the Reichstag. The only dissenting voice came from the Socialist benches, where a small but determined minority opposed "all schemes of conquest," and where the majority, while willing to vote war credits, and unwilling to permit France to regain Alsace-Lorraine, might be counted upon to offer some remonstrance against the annexation of Belgium and Northern France. (For a discussion of the Socialists' attitude, consult SOCIALISM.)

THE FINANCIAL BURDEN. During the December session of the Reichstag, Dr. Helfferich again demanded a new war credit of 10,000,000,000 marks, and obtained the authorization of the Reichstag for the issue of a new loan to cover the amount. Dr. Helfferich characterized the German plan of financing the war as a policy "based on sober and cool consideration of all the facts, and particularly on the demand that the productive energy of the German nation shall be maintained as efficiently as possible during the war." He warned the Reichstag, however, that a time was coming when German capital would be invited not to invest in 5 per cent loans, but to pay heavy war taxes. Regardless of the amount of the war indemnity, the war would bring in its train a "colossal" tax burden, which the German people would have to bear by increased taxation. One feature of the new taxes, foreshadowed by the secretary of the treasury, would be the taxation of war profits; and companies doing a war business would be required to lay aside 50 per cent of their war profits in preparation for the tax that would follow the conclusion of peace. The statements of Dr. Helfferich did not wholly satisfy the Socialists. In the Reichstag, and in their party organ, *Vorwaerts* (which, by the way, had been suppressed more than once for its criticism of the government), the Social Democrats pointed out the gravity of the financial situation. Where, they asked, was Germany going to obtain the revenue sufficient to meet the annual interest, amounting to two billion marks, on the war debt of forty billions? Certainly the ordinary revenues and the income from customs duties would be insufficient. The inference was of course that taxes on large incomes and fortunes should be introduced to fill the gap.

THE POLES AND DANES IN PRUSSIA. The budget debates in the Prussian Diet gave rise on March 9th to a most interesting expression of the attitude of the Poles and the Danes in Prussia. In behalf of the Poles, Dr. von

Tramczynski declared, "For more than 30 years the government and the majority of the Landtag have regarded the Polish population as an enemy within the state, and have sought to cripple the free development of our national individuality by means of exceptional laws and administrative measures. More than 12,000,000 marks, towards which we have been forced to contribute in taxes, have been expended by the state for the suppression of our nationality. To fight against these efforts was our duty and our right. But although now as hitherto we are decided to defend our nationality to the last breath, we have never abandoned legal methods, and have always fulfilled our duties as citizens. We have voted all the war credits here and in the Reichstag. On the battle fields more Polish blood has been shed for the state than the size of the Polish population would give reason to expect." In return the Poles had expected no longer to be treated as enemies. "In particular we had expected that the government would at least concede the suspension of the Expropriation Law and the Settlement Prohibition, as well as the reintroduction of Polish popular education. Nothing of the sort happened. The government has contented itself with holding out vague suggestions of a future alteration of conditions. . . . Even this year's budget contains all the appropriations destined for the oppression of the Polish nationality. We protest against this treatment." On these grounds the Poles voted against the Prussian budget. Next, Deputy Njssen, a Dane, reminded the House that the Danes had always fulfilled the duties of citizenship, although they had been unjustly accused of many disloyal acts. In this war, "they have bled by thousands on the battlefields in the east and in the west. But even during the war, the exceptional treatment of the Danish population is continued, in absolute contradiction to the Emperor's declaration that there were no longer any parties in the land. The budget contains many items for combating the Danes in North Schleswig, and therefore it is impossible for us to vote the budget." The Social Democrats joined with the Danes and Poles in opposing the budget, and demanded that democratic franchise and the right of free combination be granted to the masses. In the final vote on the budget, the Socialists alone voted *contra*, while the Danes and Poles abstained.

THE SOCIALISTS IN THE PRUSSIAN DIET. A disquieting feature of the Prussian Landtag session in June was the anti-war attitude taken by the Socialists. The House of Deputies was thrown into an uproar when Herr Braun, the Socialist floor leader, proclaimed his belief that "it would be a calamity for Germany" to carry the ideas of annexation and conquest which had been gaining ground, under the encouragement of selfish interests and short-sighted political parties. "The German nation wants no conquests and no annexations," he asserted, "it wants peace, and a peace which neither humiliates nor violates other nations." At the same session Herr Liebknecht cried out: "We have the masses with us and the masses want peace." High prices, the selfishness of Prussian landlords, and the criminal greed of food speculators receive their due share of denunciation from the Prussian Socialists.

THE ECONOMIC SITUATION IN PRUSSIA. Be-

fore terminating its session in June the Prussian Diet found time to discuss the grave economic problems which the war had created. Reports were made on various phases of the economic situation, and in accordance with the recommendations of the special committee which had investigated the matter, a series of measures were approved for the more efficient conservation of the kingdom's resources. The War Grain Company, which had hitherto controlled the purchase of food supplies, was now to be dissolved and a central committee instituted, representing consumers and producers; the committee would assume control of the purchase of provisions, acting in close harmony with and in subordination to the Imperial government. In harvesting the next year's crop, it was anticipated that the labor of prisoners of war would be of valuable assistance. As regards the industrial situation, Herr Hirsch of Essen reported that since the outbreak of war the production of crude iron had increased by about 1,000,000 tons a month and the output of manufactured steel and iron had been doubled. This increase had been largely absorbed by the enormous demands of the munitions factories. In regard to Germany's economic future, Herr Hirsch displayed the cheeriest optimism. Germany had withstood the shock of the interruption of her raw material supplies, and she would emerge from the war stronger and more prosperous than ever before.

BAVARIA. King Ludwig of Bavaria made a very important speech June 7th before the meeting of a Canal Association at Fuerth. The passage in which the King advocated the annexation of new territory at the conclusion of the war was widely quoted by the annexationist party in Germany. "When the war began," said King Ludwig, "we assured ourselves that it would be a war of short duration. But events shaped themselves differently. Upon the war declaration by Russia followed the declaration of war by France, and when in addition the English fell upon us, I said I rejoice thereat, and I rejoice for this reason, that now we can hope—and this especially concerns the Canal Association—that ultimately we may assure for South and West Germany more favorable connections with the sea. Ten months have elapsed since then. Much precious blood has been shed. But it shall not have been shed in vain. A strengthening of the German Empire and the extension of its frontiers as far as is necessary to insure us against future wars, that shall be the fruit of this war."

OTHER EVENTS. A university was chartered August 1st, at Frankfort on the Main. The university included faculties of medicine, philosophy, natural science, and social science, and numbered on its teaching staff 49 professors, 13 assistant professors, and 18 docents. In December it was estimated that during the first eight months of the year, 186 counts, 456 barons, 592 members of the old nobility, and 552 members of the newer nobility had been killed in the war. Nine princes had been slain in the war, including Maximilian of Hesse, Friedrich Wilhelm zur Lippe, Friedrich of Saxe-Meiningen, Ernst of Saxe-Meiningen, Ernst zur Lippe, Otto Victor of Schönburg-Waldenburg, Wilhelm zu Schönau-Carolath, Wolrad zu Waldeck und Pyrmont, and Henry XLVI of Reuss.

CHANGES IN WAR STAFF. General von Fal-

kenhayn resigned his post as minister of war January 21st, but continued as chief of staff. As war minister he was succeeded by Major-General von Hohenborn. In February, Admiral von Pohl, chief of the Admiralty Staff, succeeded Admiral von Ingenohl in command of the German battle fleet. Consult also **UNITED STATES, Foreign Relations; MILITARY PROGRESS; WAR OF THE NATIONS; SOCIALISM.**

GERBITZ'S CHART, LOST ISLANDS OF. See **EXPLORATION, North America.**

GERVILLE-REACHE, JEANNE (Mrs. GEORGE G. RAMBAUD). A French opera singer, died Jan. 5, 1915. She was born in 1882, in the Basque province, and she studied music in Paris. In 1899 she came to the notice of Mme. Emma Calvé who advised her to study for the operatic stage. At 18 she became a pupil of Mme. Pauline Viardot-Garcia. Not long after she appeared at the Opéra Comique, where she sang in the opera *Orpheus and Eurydice*. She sang with great success in various operas in Paris until 1907, when she was engaged by Oscar Hammerstein to sing at the Manhattan Opera House, and there she continued until 1910. During this period she created the part of Clytemnestra in Strauss's *Electra*. While at the Manhattan Opera House she also sang in *Carmen*, *Pelleas and Melisande*, *La Navarraise*, and *Samson and Delilah*. She later joined the Dippel Opera Company, singing in Chicago, Philadelphia, and at the Manhattan Opera House. She also made a concert tour through the United States in 1909. She married Dr. George Gibier Rambaud, director of the Pasteur Institute in New York City.

GIBRALTAR. A narrow peninsula extending southward from the southwest coast of Spain; a British crown colony, naval and coaling station, and entrepôt of the British trade with the Barbary States. Area, $1\frac{1}{2}$ square miles; population, exclusive of the military, 18,448 in 1912. Practically a free port, it has no trade returns. Revenue (1913), £104,634; expenditure, £82,077; total tonnage entered and cleared, 12,476,079 (7,416,875 British). The customs revenue in 1913 was £46,624. The Rock of Gibraltar (*Mons Calpe*) was captured by the British in 1704 from the Spanish kingdom of Granada, and in 1713 was formally ceded by the terms of the treaty of Utrecht.

GIFTS AND BEQUESTS. The gifts and bequests made for various purposes in 1915 show a falling off in amount as compared with 1914. This decrease was to be expected on account of the immense sums which were contributed to various foreign relief funds. Adding such contributions, it is probable that more actual money was given away in 1915 than ever before. The total amount thus given could not have been less than \$300,000,000. Outside of money given for war relief and kindred purposes the total for 1915 amounted to \$146,682,930, compared with \$318,599,482 in 1914, and \$199,841,442 in 1913. These sums take into account only donations of a public character. If there should be added all those privately given, the total would have been more. These sums are identified as follows: To charities of various kinds \$79,861,329; to educational institutions \$35,354,338; to religious organizations \$17,611,862; to art museums, galleries, and various municipal institutions \$12,939,401; and to libraries \$916,000. From the women of the

country there was contributed to the total sum \$28,304,658. The three largest contributors did not give as freely in 1915 as in 1914. John D. Rockefeller gave in 1915 \$1,970,000, Andrew Carnegie \$3,330,000, and Mrs. Russell Sage \$341,000.

This list mentions only those gifts whose value was \$5000 or over. We are indebted for it to the courtesy of the *Chicago Tribune*.

Adams, John Q., Long Beach, Cal., will to church, \$5000.
 Agassiz, George R., gift to Harvard University, \$25,000.
 Alexandria, Pa., will to library by William H. Woolverton, \$40,000.
 Allegheny College, gift by Andrew Carnegie, \$40,000.
 Allen, Dudley P., Cleveland, Ohio, will to Cleveland Art Museum, \$100,000; will to Cleveland Medical Library, \$200,000.
 Allen, James H., St. Louis, Mo., will to charity, \$1,000,000.
 Allentown, Pa., Woman's College, gift by various donors, \$75,000.
 Allston, I. W., Philadelphia, Pa., gift to church, \$5000.
 American Baptist Foreign Mission Society, gift by Rockefeller Foundation, \$50,000.
 American College for Girls at Constantinople, gift by Grace Dodge, \$25,000.
 American College of Surgeons, Boston, Mass., gift by various donors, \$500,000.
 American Commission to Belgian Relief, \$1,000,000.
 American hospital, Paris, gift by William Lindsay, \$10,000; gift by Frank A. Munsey, \$50,000; gift by various donors, \$10,000; gift by various donors, New York, \$10,000.
 American Red Cross, gift by Rockefeller Foundation, \$25,000.
 American Relief Clearing House, Paris, gift by James Stillman, \$100,000.
 Ames, Ward, and J. H. Barnes, Duluth, Minn., gift to Y. M. C. A., \$60,000.
 Anderson, Elizabeth, New York, gift to Mental Hygiene Institute, \$50,000.
 Andrews, Mrs. J. M., Raleigh, N. C., will to church, \$18,000.
 Animal diseases, for laboratory for study of, gift by Rockefeller Foundation, \$1,000,000.
 Animal protection, gift for, by Mrs. Russell Sage, \$15,000.
 Annual donations to Episcopal board of missions, \$1,067,000.
 Anti-tuberculosis Association, gift by Elizabeth C. Coolidge, \$100,000.
 Armenian relief fund, gift by Rockefeller Foundation, \$30,000; gift by Mrs. Russell Sage, \$5000.
 Armour, Ogden, Chicago, Ill., gift to Lying-In Hospital, \$100,000.
 Art Institute, Chicago, Ill., gift by Daniel C. French, \$11,000; will by Martha S. Hill, \$30,000; will by Alexander A. McKay, \$100,000; gift by W. H. Miner, \$50,000; will by Albert A. Sprague, \$50,000.
 Atkinson, C. F., Boston, Mass., will to charity, \$31,000.
 Aviation corps, gift by unnamed donor, \$5000.
 Babcock, Eugenie L., Plainfield, N. J., will to church, \$75,000.
 Babcock and Wilcox Co., New York, gift to Stevens Institute of Technology, \$25,000.
 Bachman, Julia A., Columbia, S. C., will to church, \$9000.
 Baden, J. P., Winfield, Kan., gift to Winfield Lutheran College, \$75,000.
 Baker, George F., New York, gift to Cornell University, \$540,000.
 Bale Brothers, Muncie, Ind., gift to Hillsdale College, \$30,000.
 Ballard, H. W., Indianapolis, Ind., will to New Salem Academy, \$10,000.
 Baptist missionary societies, gift by John D. Rockefeller, \$100,000.
 Bard, Thomas B., Ventura, Cal., will to charity, \$15,000.
 Barnard, George D., St. Louis, Mo., will to Barnard Hospital, \$2,000,000; to other charities, \$20,000.
 Barnard College, gift by Jacob H. Schiff, \$500,000; will by Anne E. Smith, \$10,000.
 Barnard Hospital, St. Louis, Mo., will by George D. Barnard, \$2,000,000.
 Barnes, J. H., and Ward Ames, Duluth, Minn., gift to Y. M. C. A., \$60,000.
 Barre (Vt.), hospital, gift by Ira C. Calef, \$20,000; by various donors, \$60,000.
 Barton, Michael, Chicago, will to church, \$25,000.

Battell, Joseph, will to charity, \$10,000; to Middlebury College, \$220,000.
 Batterson, Sarah E. F., Philadelphia, Pa., will to charity, \$100,000.
 Baumgarten, Bernard, Chicago, Ill., will to charity, \$95,000.
 Beall, Amelia G., Carlisle, Pa., will to charity, \$30,000.
 Beall, James M., Baltimore, Md., will to Johns Hopkins University, \$37,500.
 Bedford, Iowa, gift of library by Andrew Carnegie, \$10,000.
 Beebe, J. A., Boston, Mass., will to charity, \$30,000; to church, \$25,000.
 Belgian hospital, gift by various donors, Chicago, Ill., \$20,000.
 Belgian professors, gift by Harvard University corporation, \$100,000.
 Belgian relief, gift by American Commission, \$1,000,000.
 Belgian relief cargoes, \$9,300,000.
 Belgian relief fund, contributions by Detroit, \$38,000; gift by various donors, \$380,000.
 Belgian relief fund vessels, \$4,305,000.
 Belgium, gift by *Chicago Tribune's* moving picture receipts, \$30,000; gift by Kansas, \$500,000.
 Bellows Falls, Vt., gift to charity by various donors, \$450,000.
 Benedict, Maria N., New York, will to charity, \$10,000.
 Benson, S., Portland, Oreg., gift for trade school, \$100,000.
 Berry, H. W., Boston, Mass., will to Northfield schools, \$8000.
 Billok, A. C., Los Angeles, Cal., will to charity, \$30,000.
 Bishop, Charles R., Berkeley, Cal., will to charity, \$19,400.
 Bismarck Garden Festival, Chicago, Ill., to charity, \$80,000.
 Blair, Mrs. J. C., Huntingdon, Pa., gift to hospital, \$30,000.
 Blind, gifts to, by various donors, \$213,000.
 Bliss, Catherine A., New York, will to church, \$20,000.
 Bliss, Mrs. W. H., New York, gift to National Aero fund, \$10,000.
 Block, Joseph, Chicago, Ill., will to charity, \$21,000.
 Blumenthal, Ferdinand, New York, will to charity, \$10,000.
 Board of education, Chicago, Ill., gift by John W. Eckhart, \$10,000.
 Boehne, John M., Evansville, Ind., gift to charity, \$12,500.
 Bondy, Emile C., New York, will to charity, \$150,000; to Columbia University, \$100,000.
 Borie, Josephine L., Chicago, Ill., will to charity, \$25,000.
 Boston, Mass., gift to charity by unnamed donor, \$8000.
 Boston University, gift by various donors, \$10,000.
 Bowdoin, Julia J. G., New York, will to charity, \$20,000; to church, \$30,000.
 Brackenrip, J. W., San Antonio, Texas, gift to University of Texas, \$100,000.
 Bradford, Me., will to library by J. B. Curtis, \$20,000.
 Brady, Joseph B., New York, gift to Johns Hopkins Hospital, \$220,000.
 Brady, Nicholas, New York, gift to church work, \$110,000.
 Brigham, Mrs. S. W., New York, gift to schools, \$10,000.
 Brinks, Mrs. E. A., and Mrs. Donald McKay, gift to hospital, Englewood, N. J., \$100,000.
 Brooklyn Academy of Music, will by Charles A. Schieren, \$100,000.
 Brooklyn Institute of Arts and Sciences, will by Charles A. Schieren, \$22,975; will by R. B. Woodward, \$160,000.
 Brown, Augustus C., New York, will to charity, \$132,500.
 Brown, Phoebe C., Philadelphia, Pa., will to charity, \$6000.
 Brown, Sarah A., Nashua, N. H., will to church, \$10,000.
 Brown, Waldron P., New York, will to charity, \$10,000; will to church, \$10,000.
 Brown, W. W., Bend, Oreg., will to charity, \$500,000.
 Browne, W. W., Oregon, will to church, \$500,000.
 Brown University, gift by Jessie L. Rosenbeyer, \$7000; gift by unnamed donor, \$10,000.
 Brubaker, Lancaster, Pa., will to charity, \$5000.
 Brunt, James A. B., Anderson, Ind., gift to Y. M. C. A., \$125,000.

Brush, O. S., Philadelphia, Pa., will to charity, \$164,000.
 Buck, Asariah, Kankakee, Ill., will to home for aged, \$100,000.
 Buhl, Frank H., New York, gift to five cities in Chenango County, \$1,000,000; to Sharon, Pa., \$500,000.
 Busch, Mrs. Adolphus, gift to Harvard University, \$50,000.
 Cadman, Robert, Portland, Me., gift to church, \$60,000.
 Cadwalader, John L., New York, will to Harvard University, \$20,000; to New York Public Library, \$151,000; to New York Zoological Society, \$20,000; to Princeton University, \$25,000.
 Cains, James W., New York, will to charity, \$5000.
 Caldwell, Mrs. W. E., Macomb, Ill., gift to Illinois Holiness Association, \$20,000.
 Calef, Ira C., Washington, D. C., gift to Barre (Vt.) hospital, \$20,000.
 California, University of, gift by Cowell estate, \$400,000; by Ellen B. Scripps, \$100,000.
 Calumet and Hecla Mining Company, gift to employees, \$500,000; to miners, \$120,000.
 Canada Red Cross, gift by Henry Ford, \$10,000.
 Carnegie, Andrew, gift to Allegheny College, \$40,000; to benefit of blind, \$100,000; to Carnegie Institution, \$2,700,000; to Emory and Henry College, \$25,000; to Wellesley College, \$95,000; gift of library to Bedford, Iowa, \$10,000; gift of library to Dimba, Cal., \$8000; gift of library to Greensboro, Ga., \$6000; gift of library to Reading, Mass., \$15,000.
 Carnegie Foundation, gift to Stevens Inst. of Technology, \$250,000.
 Carroll College, will by I. S. Tripp, \$5000.
 Carson, Henry, Lancaster, Pa., will to charity, \$10,000.
 Chenango County, N. Y., gift to five cities in, by Frank H. Buhl, \$1,000,000.
 Chicago, Ill., gift to charity by unnamed donor, \$5000; gift to charity by various donors, \$158,325; gift to church by unnamed donor, \$16,000; gift to lying-in-hospital by various donors, \$25,000.
 Chicago Art Institute, unclaimed fund given by Columbian Exposition, \$47,000; by Mrs. A. A. Sprague, \$80,000.
 Chicago Symphony Orchestra, Chicago, Ill., gift by unnamed donor, \$5000; gift by Elizabeth S. Coolidge, \$100,000.
 Chicago Tribune's moving picture receipts to Belgium, \$30,000.
 Chicago University, gift of land to, \$25,000.
 Children, benefit of, gift by various donors, Chicago, Ill., \$43,000.
 Children's Hospital, gift by E. T. Stotesbury, \$50,000.
 Cincinnati Medical College, gift by various donors, \$1,000,000.
 Cincinnati Orchestra, will of Cora Dow, \$700,000.
 Clark, Charles H., Brattleboro, Vt., will to charity, \$50,000.
 Clark, Sarah M., Chicago, Ill., will to charity, \$5000; to church, \$20,000.
 Cleveland Art Museum, gift by Dudley P. Allen, \$100,000.
 Cleveland Medical Library, will by Dudley P. Allen, \$200,000.
 Cobb, John B., New York, gift to University of Virginia, \$50,000.
 Cobham, Henry, Warren, Pa., will to Salvation Army, \$100,000.
 Coffin, L. S., Fort Dodge, Iowa, will to charity, \$7000; to Lenox College, \$15,000; to Storm Lake College, \$20,000.
 Colby, H. F., Dayton, Ohio, will to church, \$8000.
 Coleman, Emma, New York, will to charity, \$6750.
 Coles, William W., New York, will to charity, \$100,000.
 College of St. Andrew, will by E. C. Walker, \$10,025.
 Columbian Exposition, unclaimed fund given to Chicago Art Institute, \$47,000.
 Columbia University, gift by Emile C. Bondy, \$100,000; gift by Amos F. Eno, \$80,000; gift by Albert F. Plant, \$15,000; gift by George W. Millorth, \$5000.
 Combs, Mr. and Mrs. J. F., Philadelphia, Pa., gift to charity, \$50,000.
 Compton, Lizzie, Elkhart, Ind., gift to Y. W. C. A., \$10,000.
 Connell, Agnes A., New York, will to charity, \$40,000.
 Connell, Amanda, Philadelphia, Pa., will to Drew Seminary, \$5000.
 Conrad, Norman, New Orleans, La., will to Tulane Library, \$5000.
 Coolidge, Elizabeth C., Pittsfield, Mass., gift to

Anti-tuberculosis Association, \$100,000; to art institute, \$100,000; to Chicago Symphony Orchestra, \$100,000.
 Coonley, Mrs. Avery, Chicago, Ill., gift to Vassar College, \$25,000.
 Cornell University, gift by George F. Baker, \$540,000.
 Coward, Martha A., Philadelphia, Pa., will to charity, \$5500.
 Cowell estate, San Francisco, Cal., gift to University of California, \$400,000.
 Cudahy heirs, Pasadena, Cal., gift to Sisters of Holy Name Academy, \$100,000.
 Cullamore, Helen, Boston, Mass., will to charity, \$685,000; to Institute of Technology, \$500,000; to Museum of Fine Arts, \$100,000; to Radcliffe College, \$20,000; to Simmons College, \$100,000.
 Currier, Hannah M., Manchester, N. H., will for art gallery, \$1,000,000.
 Curtis, J. B., Bradford, Me., will to library, \$20,000.
 D. A. R. Museum, gift by Mrs. A. H. Strong, \$50,000.
 Dartmouth College, gift by W. H. Hunt, \$20,000; will of Walter W. Hodges, \$25,000.
 Dato, Henry, Chicago, Ill., will to Methodist missions, \$40,000.
 Davenport, Orlando H., Boston, Mass., will to charity, \$500,000.
 Davidson, Sarah, Sanbornton, N. H., will to charity, \$85,000.
 Davies, Annie B., New York, gift to Metropolitan Museum of Fine Arts, \$50,000.
 Davis, Thomas A., Maysville, Ky., will to school library, \$7000.
 Dean, Edmund H., Darlington, S. C., will to charity, \$30,000.
 De Forrest, Mrs. M. F., Atchison, Kan., gift to hospital, \$60,000.
 Delaware College, gift by unnamed donors, \$900,000; by various donors, \$1,000,000.

GOLD. The mined production of gold in the mines of the United States for the calendar year 1914 was 4,484,544 fine ounces, valued at \$92,703,757. This was an increase in value of \$2,715,869 over the production of 1913. The principal gold producing States ranked as follows in 1914: California, Colorado, Alaska, Nevada, South Dakota, Arizona, Montana, Utah, Oregon, Philippines, Idaho, and New Mexico. No other States than these mentioned have produced over \$1,000,000 in the last year. The most notable increases in the gold output in 1914 were \$1,736,189 in Colorado, \$624,479 in Montana, and \$503,152 in the Philippines. The largest decreases were \$313,942 in Nevada, \$299,882 in Utah, \$192,244 in Idaho, and \$139,102 in Washington. The imports of gold in the United States for the calendar year 1914 amounted to \$57,387,741, and the exports to \$222,616,156.

The gold production for 1915 is estimated by the director of the mint. The table given below shows the total mine production of gold in the various States in 1914, and the value of the increase or decrease as compared with 1913.

State or Territory	Quantity	Gold Value	Increase (+) or decrease (—)	
			Gold (value)	
Alabama	579.05	\$11,970	+	\$876
Alaska	762,596.03	15,764,259	+	137,446
Arizona	202,166.62	4,179,155	+	155,244
California	999,112.87	20,653,496	+	246,538
Colorado	961,845.20	19,883,105	+	1,736,189
Georgia	787.06	16,270	+	1,162

WORLD PRODUCTION. The world production of gold in 1913-14 is shown in the following table:

WORLD'S PRODUCTION OF GOLD, 1913-1914, BY COUNTRIES		
Country	1913	1914
North America:		
United States	\$88,884,400	\$94,531,800
Canada	16,216,131	15,925,044
Mexico	18,250,000	18,000,000
Cuba	24,600	
Africa:	205,875,000	201,000,000
Australasia:	53,038,090	49,386,180
Europe:		
Russia and Finland	24,578,575	26,750,000
Austria-Hungary	2,180,441	1,500,000
Germany	60,000	
Norway		
Sweden	86,630	
Italy	30,572	
Spain and Portugal	2,500	
Turkey	500	
France	1,946,600	1,000,000
Great Britain	17,860	
Serbia	250,000	100,000
South America:		
Argentina	100,000	
Bolivia and Chile	800,000	500,000
Colombia	3,000,000	3,000,000
Ecuador	289,133	
Brazil	3,009,786	3,000,000
Venezuela	444,800	
Guiana—		
British	1,853,368	1,250,000
Dutch	470,433	500,000
French	3,050,600	3,000,000
Peru	492,200	500,000
Uruguay	111,000	
Central America:	3,000,000	3,500,000
Asia:		
Japan	4,470,723	4,476,500
China	3,658,900	3,800,000
Indo-China	70,000	
Chosen (Korea)	3,281,333	3,750,000
Siam	56,500	
India, British	11,152,463	11,888,870
East Indies, British	1,352,000	
East Indies, Dutch	3,387,100	4,750,000
Total	\$454,942,211	\$453,000,000

The gold production of the world in 1915, according to the preliminary estimates made by the *Engineering and Mining Journal*, New York, in its annual review of the year, was greater than for the previous two years, and indicated an excellent showing for the gold mining industry, although it must be considered that the European war did not directly affect any of the great gold mining regions even in Russia. The estimated increase from 1914 was \$19,397,761, the gain being due chiefly to the increased production of the Transvaal and the United States, though as will be seen from the accompanying table, the increase was evident for the more important producing districts except in Australasia and Mexico. The Transvaal in 1915 produced about 40 per cent of the world's total, the United States about 21 per cent, Australasia a little over 9 per cent, and Russia about 6 per

cent, accounting for three-quarters of the world's supply.

GOLD PRODUCTION OF THE WORLD (<i>Engineering and Mining Journal</i> , New York)		
	1914	1915
Transvaal	\$173,176,133	\$188,397,707
Rhodesia	17,745,980	18,852,135
West Africa	8,871,371	8,556,550

See also METALLURGY.

GOLD COAST. A British crown colony and protectorate, with Ashanti and the Northern Territories, situated on the Gulf of Guinea. Area of the colony, 24,200 square miles; of Ashanti, 20,000; of the Northern Territories, 35,800—total, 80,000. The census (1911) returns place the population for the colony at 853,766; Ashanti, 287,814; Northern Territories, 361,806; but the figures are believed to understate the actual number of inhabitants. Accra, the capital, had (1911) 19,585 inhabitants; Coomassie, 18,853; Cape Coast Castle, 11,364; Secondee, 7725. The chief products and exports (1913) are cacao, £2,489,218; gold and gold dust, £1,656,110; rubber, £87,915; palm kernels, £159,128; palm oil, £65,952; lumber, £366,094; kola nuts, £144,705. Cotton goods, provisions, and wine and spirits are the main imports. Total trade (1913): £4,952,494 imports, £5,427,106 exports. Revenue, £1,301,566; expenditure, £1,363,291. Tonnage entered and cleared, 2,986,553. A railway runs from Secondee to Coomassie, 168 miles. A railway under construction from Accra to Akwapim is open for traffic to a temporary terminus at Mangoase, about 39 miles distant. An extension to Komfrodna was to be completed in 1915. Total telegraph lines, 1492 miles.

GOLF. The names of Jerome D. Travers and Robert A. Gardner stand out in the golfing history of 1915. The former captured the open title at Baltusrol and the latter won the amateur laurels at Detroit. Both are veterans at the game, and it is noteworthy in this regard that the year produced few new players of special merit. The women's championship went to Mrs. Clarence H. Vanderbeck of Philadelphia. The victory of Travers in the open tourney was in the nature of a "come back," as it was figured that the winner of the amateur title on four different occasions had seen his best days as a golfer. As it turned out, however, the only player to give Travers a battle was Tom McNamara, a professional, who covered the 72 holes in 298, or one stroke less than the victor's

total. This marked the second time in 21 years that an amateur was successful in the quest of the open title. The showing of Travers at Baltusrol made him the favorite in the amateur tournament. Francis Ouimet and Charles Evans also had large followings. All three of these were eliminated before the final round, and Gardner emerged the winner through his defeat of John G. Anderson of Mount Vernon, N. Y. Gardner first captured the amateur honors back in 1909. The women's championship tourney narrowed down to a bitter struggle between Mrs. Vanderbeck and Miss Alexa Stirling, the Southern title holder from Atlanta, Ga. Mrs. Vanderbeck won only after the deciding match had been carried to the fourth extra hole. The most promising of the younger players of the year were Philip V. G. Carter of the Nassau Club, F. K. Robeson, a Pawling schoolboy, Jesse Guilford, Archie McIlwaine, Roy D. Webb, Reginald Lewis, Nelson Whitney, and Oswald Kirkby.

The winners of the leading tournaments were: United States Amateur, Robert A. Gardner; United States Open, Jerome D. Travers; United States Women, Mrs. Clarence H. Vanderbeck; Metropolitan Amateur, Walter J. Travis; Metropolitan Open, Gilbert Nicholls; Metropolitan Women, Miss Lillian B. Hyde; Metropolitan Junior, Philip V. G. Carter; Western Amateur, Charles E. Evans, Jr.; Western Open, Thomas L. McNamara; Western Women, Miss Elaine Rosenthal; Western Junior, De Witt C. Balch; Southern Amateur, Charles L. Dexter, Jr.; Southern Women, Miss Alexa Stirling; Panama-Pacific Amateur, Harry K. B. Davis; Panama-Pacific Open, Walter C. Hagen.

In the intercollegiate championships Yale defeated Princeton in the final round by 5 up and 4 to play. The individual winner was F. R. Blossom of Yale, who vanquished G. A. Peacock of Princeton, in the final by 11 up and 9 to play. The Western intercollegiate championship was won by the University of Illinois.

GOODALE, GREENLEAF AUSTIN. An American soldier, died Feb. 17, 1915. He was born in Orrington, Me., in 1839, and was educated in the Eastern Maine Conference Seminary. He enlisted as a private in the sixth Maine infantry in 1861, and served throughout the war. He was mustered out of volunteer service in 1866 with the rank of captain. In the same year he was appointed lieutenant in the United States infantry, and rose through various grades until he became brigadier-general in 1907. He received several brevets for gallant service during the Civil War. From 1868 to 1898 he took part in Indian campaigns. In 1898-1901 he served in the Philippines.

GOODRICH, JOHN ELLSWORTH. An American classical scholar, died Feb. 24, 1915. He was born in Hinsdale, Mass., in 1831 and graduated from the University of Vermont in 1853. He served as chaplain of the first Vermont cavalry in 1864-65. For many years he was principal of academies in Massachusetts, Vermont, and New Hampshire, and from 1868 to 1870 was superintendent of schools in Burlington, Vt. Between 1872 and 1907 he held chairs at the University of Vermont, where he was professor of Latin for 18 years. He was also librarian of the university from 1873 to 1886, and was dean of the department of arts from 1903 to 1907. He contributed to several en-

cyclopedias, and edited the *Vermont Revolutionary Rolls* in 1904.

GÖRZ AND GRADISCA. See AUSTRIA-HUNGARY.

GOULD, ELGIN RALSTON LOVELL. An American public officer and economist, died Aug. 18, 1915. He was born in Oshawa, Ont., in 1860, and graduated from the University of Toronto in 1881. He afterwards studied at Johns Hopkins, taking the degree of Ph.D. in 1886. From 1892-97 he was lecturer at Johns Hopkins, and from 1895-96 professor in the University of Chicago. In 1896 he became president of the City and Suburban Homes Company of New York, and worked on plans to improve the lives and surroundings of wage earners and at the same time provide a profitable commercial investment. In 1901-02 he was a lecturer on political economy in Columbia University. He was appointed city chamberlain of New York in 1902, holding office until 1904. In 1907-08 he was vice chairman of the New York Charter Revision Committee. He was active in financial, philanthropic, and religious affairs, and in reform movements in New York, and was a member of many learned societies. His writings include: *Housing of Working People*; *Popular Control of the Liquor Traffic*; *The Gothenburg System of Liquor Traffic*; and *The Social Condition of Labor*. He also contributed on economic subjects to magazines.

GOVERNMENT. See section so entitled under various countries.

GOVERNORS' CONFERENCE. The eighth annual meeting of this body, known also as the "House of Governors," was held in Boston, August 24 to 27. The topics considered were, penology, greater efficiency in State administration, conservation, and the relation of the State to the national defense. Important addresses on these and other subjects were made. The next meeting of the conference will be in Salt Lake City, Utah.

GRAIN. See AGRICULTURE.

GRAND MAL. See EPILEPSY.

GRANT, ROBERT. See LITERATURE, ENGLISH AND AMERICAN, *Fiction*.

GRAPES. See HORTICULTURE.

GRAPHITE. The total production of graphite in 1914 was 4336 short tons, valued at \$324,118. Of this 1725 was amorphous, and 5,220,539 pounds were crystalline. The greater part of the latter is produced in New York, Pennsylvania, and Alabama. The imports of graphite during the year were 22,002 short tons, valued at \$1,398,261. The largest amount came from Ceylon. Japan and Mexico furnished also large quantities.

GRAY, JOHN CLINTON. An American jurist, died June 28, 1915. He was born in New York City in 1843, and studied at the University of Berlin in 1860-61. In the latter year he entered the Harvard Law School, graduating in 1864. He afterwards took a course in law at New York University. After practicing for several years in Boston he removed to New York, where he became one of the most prominent lawyers. He was appointed judge of the Court of Appeals by Governor Hill in 1888, and in November of that year was elected to a full

term of 14 years. He wrote opinions in several of the most important cases tried in New York City during his term on the bench. He was reelected in 1902, but retired in 1913.

GREAT BRITAIN. THE UNITED KINGDOM OF GREAT BRITAIN AND IRELAND. A constitutional monarchy. Capital, London. Great Britain consists of England, Scotland, and Wales. The term "Great Britain," however, is often used to mean "United Kingdom." Attached to the United Kingdom, but not properly a part of it, are the Isle of Man and the Channel Islands.

AREA AND POPULATION. The area of the United Kingdom, including inland water, is stated at 121,331 square miles; including the Isle of Man and the Channel Islands, 121,633 square miles, an area less than that of New England, New York, and New Jersey (123,852 square miles). England and Wales, which are often regarded as a unit, comprise 58,340 square miles, or in land area alone 58,029 square miles; Scotland, 30,405 square miles, or in land area 29,796 square miles. By divisions the area, the population according to the censuses of April 1, 1901, and April 3, 1911, and the density per square mile in 1911, are shown in the following table:

	<i>Sq. M.</i>	<i>Pop. 1901</i>	<i>Pop. 1911</i>	<i>Dens.</i>
England *	50,874	30,813,043	34,045,290	669
Wales	7,466	1,714,800	2,025,202	271
Scotland	30,405	4,472,108	4,760,904	156
Ireland	32,586	4,458,775	4,890,219	135
U. Kingdom	121,331	41,458,721	45,221,615	373
Isle of Man	227	54,752	52,016	229
Channel Isles	75	95,618	96,899	1,292
Total	121,633	41,609,091	45,870,530	374

* Including Monmouthshire.

The population figures represent persons present; no census of the resident, or legal, population is taken in the United Kingdom, and therefore the figures above do not include British soldiers, sailors, and merchant seamen abroad.

The estimated population of the United Kingdom, June 30, 1913, was 46,026,483; June 30, 1914, 46,407,037 (England and Wales, 37,302,983; Scotland, 4,728,500; Ireland, 4,375,554). The population of Great Britain and Ireland was, at different periods, as follows:

	<i>E. & W.</i>	<i>Scot.</i>	<i>Ire.</i>	<i>U. K.</i>
1841	15,914,148	2,620,184	8,196,597	26,730,929
1871	22,712,266	3,360,018	5,412,377	31,484,661
1881	25,974,439	3,735,578	5,174,836	34,884,848
1891	29,002,525	4,025,647	4,704,750	37,732,922
1901	32,527,843	4,472,108	4,458,775	41,458,721
1911	36,070,492	4,760,904	4,890,219	45,221,615

The following table shows the percentage of population in the several divisions and, in the last two columns, the percentage of increase in the decennial periods 1891-1901 and 1901-11:

	<i>1841</i>	<i>1891</i>	<i>1901</i>	<i>1911</i>	<i>'91-'01</i>	<i>'01-'11</i>
England	56.1	72.8	74.3	75.8	12.1	10.5
Wales	3.4	4.0	4.1	4.5	13.3	18.1
Scotland	9.8	10.7	10.8	10.5	11.1	6.4
Ireland	30.7	12.5	10.8	9.7	*5.2	*1.7

* Decrease.

In England and Wales, the increase per cent by births in the period 1901-11 was 28.56; decrease by deaths, 16.13; natural increase, 12.43.

The actual increase per cent was 10.89, the difference between actual increase and natural increase being accounted for by excess of emigrants over immigrants.

In 1911 the number of males and females were, respectively: England, 16,421,298 and 17,623,992 (or 1073 females to 1000 males); Wales, 1,024,310 and 1,000,892 (977 females to 1000 males); Scotland, 2,308,839 and 2,452,065; Ireland, 2,192,048 and 2,198,171.

In England and Wales, the population of urban districts in 1901 numbered 25,058,355, and of rural districts 7,469,488; in 1911, 28,162,936 and 7,907,556. In 1851 the percentage of population in urban districts in England and Wales was approximately 50.2; in 1881 the actual percentage was 67.9; in 1891, 72.0; in 1901, 77.0; in 1911, 78.1. While the general increase per cent in England and Wales was 10.89 in the period 1901-11, the urban increase was 11.1 and the rural 10.2; in the period 1891-1901, the urban increase was 15.2 per cent, and the rural 2.9 per cent. England and Wales had at the 1911 census, 97 urban districts (including the administrative county of London as one district) with a population exceeding 50,000 each. The inhabitants of these districts in 1891 numbered 13,779,848; in 1901, 15,886,874; in 1911, 17,251,009; the increase per cent in the first period being 15.3, and in the second 8.3. London (that is, the administrative county, embracing 74,816 acres, or 117 square miles) had, in 1911, 4,521,685 inhabitants, as compared with 4,536,267 in 1901, or a decrease of 0.3 per cent. The term, "Greater London," is used to describe the area covered by the Metropolitan and City of London police districts; this area embraces, besides the administrative county of London, a wide belt of suburban towns and districts, known as the "outer ring." The outer ring had in 1901, 1,405,852 inhabitants; in 1911, 2,729,673. The area of the outer ring is 368,608 acres, or 576 square miles. Greater London embraced 443,424 acres, or 693 square miles, with 7,251,358 inhabitants in 1911, as compared with 6,581,402 in 1901 and 5,633,806 in 1891; the increase from 1891 to 1901 being 16.8 per cent, and from 1901 to 1911 10.2 per cent. In 1911 the population of the larger cities of England and Wales, after London, with percentage of increase of 1901, was as follows: Birmingham, 525,833 (0.5)—with districts annexed Nov. 9, 1911, 840,202; Liverpool, 746,421 (6.0); Manchester, 714,333 (10.8); Sheffield, 454,632 (11.1)—with districts annexed April 1, 1912, 459,916; Leeds, 445,550 (3.9); Bristol, 357,048 (5.3); West Ham (in the outer ring), 289,030 (8.1); Bradford, 288,458 (3.1); Kingston-upon-Hull, 277,991 (15.7); Newcastle-upon-Tyne, 266,603 (7.9); Nottingham, 259,904 (8.4); Stoke-on-Trent, 234,534 (9.2); Salford, 231,357 (4.7); Portsmouth, 231,141 (22.3); Leicester, 227,222 (7.4); Cardiff (in Wales), 182,259 (10.9); Bolton, 180,851 (7.5); Croydon (in the outer ring), 169,551 (26.6); Willesden (in the outer ring), 154,214 (34.3); Rhondda (in Wales), 152,781 (34.3); Sunderland, 151,159 (3.5).

A large part of the population increase in Scotland from 1901 to 1911 was in the suburbs of Glasgow. The larger municipal boroughs, with 1911 population and increase per cent over 1901, are: Glasgow, 784,455 (1.1); Edinburgh, 320,315 (0.9); Dundee, 165,006 (1.2)—in 1913, Broughty Ferry, which had 11,058 inhabitants

in 1911, was annexed to Dundee; Aberdeen, 163,331 (6.2); Govan, 89,725 (9.2); Paisley, 84,447 (6.4); Leith, 80,489 (3.9); Greenock, 75,140 (9.0); Partick, 66,848 (23.1); Coatbridge, 43,287 (17.0); Motherwell, 40,378 (29.6).

In Ireland, the population decreased between 1901 and 1911 in all counties except Dublin, Down, Kildare, and Antrim, where the increases were 6.4, 5.2, 4.6, and 3.7 per cent respectively. Dublin had in 1911 304,802 inhabitants; with suburbs, 403,030 (increase 7.4 per cent). Population of Belfast in 1911, 386,947; Cork, 76,673; Londonderry, 40,780; Limerick, 38,518; Waterford, 27,464.

The rate, per thousand inhabitants, of births, of deaths, and of marriages (that is, persons married), is shown in the following table:

		<i>E. & W.</i>	<i>Scot.</i>	<i>Irs.</i>	<i>U. K.</i>
Births	1900.....	28.7	29.6	22.7	28.2
	1905.....	27.8	28.6	28.4	27.1
	1910.....	25.1	26.2	23.8	25.0
	1912.....	23.8	25.9	28.0	24.0
	1913.....	23.9	25.5	22.9	23.9
Deaths	1900.....	18.2	18.5	19.6	18.4

PUBLIC EDUCATION. The educational system in the United Kingdom is partly under state and local control and partly private. Elementary education is compulsory between the ages of 5 and 14, and is provided free by the local authorities aided by state grants. Secondary education is still largely of a private character, but considerable progress has been made in the organization of a secondary-school system. The schools here treated are not to be confounded with the many private, and often expensive, institutions known as "the public schools."

In England and Wales, on July 31, 1913, accommodations in the ordinary public elementary schools numbered 6,940,196, with average attendance of 88.73 per cent (6,862,876 and 88.79 per cent in 1912). At evening and similar schools, there were 798,881 pupils enrolled (784,984 in 1912). In the training colleges and hostels there were 1976 male and 3665 female students. The so-called higher elementary schools numbered 52, with accommodations for 14,810 pupils.

In Scotland, for the year ended Aug. 31, 1913, there were 3177 primary schools in receipt of grants, accommodations for 1,052,659 pupils, 816,055 enrolled, and 729,089 in average attendance (3164 schools, 1,042,703 accommodations, 820,171 enrolled, 733,792 average attendance in 1912). Attendance at continuation classes was 143,942 in 1913 (144,815 in 1912). Higher grade schools in 1912 and 1913 respectively, 194 and 193; accommodations, 41,166 and 40,922; enrollment, 24,544 and 25,372; average attendance, 24,201 and 24,817. In the training colleges and centres there were in 1913, 508 male and 1876 female students.

In Ireland, primary schools at the end of 1913 numbered 8299 (8255 at the end of 1912); school accommodations, 771,974 (769,697); pupils enrolled, 682,011 (668,974); average attendance, 502,622 (499,038). In the training colleges there were 467 male and 725 female students.

AGRICULTURE. The area, including rivers and lakes, but not including foreshore and tidal waters, of the United Kingdom, with the Isle of Man and the Channel Islands, is stated at 77,716,633 acres. The acreage for Great Britain is returned at 56,799,635 and Ireland 20,731,244. The cultivated area, as reported for the first week of June, 1913, was 46,740,904 acres, of which 31,927,301 in Great Britain and 14,691,147 in Ireland. The area under principal crops in 1913, including that in the Isle of Man and the Channel Islands, and the production in 1912 and 1913, were as follows:

	<i>Acres</i>	<i>Bushels</i>	<i>Bushels</i>
	<i>1913</i>	<i>1913</i>	<i>1913</i>
Corn crops:			
Wheat	1,791,569	57,402,802	56,696,400
Barley	1,822,321	58,207,198	65,682,531
Oats	3,983,488	164,800,683	165,282,235
Rye	63,556		
Beans	275,626	7,784,045	7,602,475
Peas	165,121	3,924,494	3,885,877
Total	8,211,641		
Other crops:			
	<i>Tons</i>	<i>Tons</i>	<i>Tons</i>

Turnips	1,770,079	24,061,857	25,319,517
Mangold	501,033	10,137,766	9,276,129
Hay	9,845,011	14,024,222	14,507,169
Hops	35,676	*373,438	*255,641

* Cwts.

Acreages for 1914 and (subject to revision) for 1915 are reported as follows: wheat, 1,904,930 and 2,334,090; barley, 1,871,170 and 1,523,980; oats, 3,877,960 and 4,148,050; potatoes, 1,197,010 and 1,202,520; turnips, 1,752,570 and 1,617,460; mangold, 515,860 and 500,490. See also AGRICULTURE.

The following table shows the number of live stock in the first week of June for four years. The figures for horses include only those used for agriculture, unbroken horses, and brood mares:

	<i>1912</i>	<i>1913</i>	<i>1914</i>	<i>1915</i>
Horses ..	1,994,607	1,874,264	1,842,560	1,699,640
Cattle ..	11,914,635	11,936,600	12,144,560	12,131,370
Sheep ..	28,967,495	27,629,206	27,886,090	28,181,540
Swine ..	3,992,549	3,305,771	3,939,890	3,783,780

MINING AND METALS. The total value of the minerals raised in 1912 was £131,220,853, and in 1913 £160,112,607. In the latter year, the spot value of the minerals raised in England

was £109,443,999, Wales £27,982,687, Scotland £22,436,444, Ireland £229,209, and the Isle of Man £20,268. By far the most important mineral is coal, and the most important metal, iron. The following table shows the amount in tons of coal produced in the United Kingdom and its spot value in pounds sterling, and the amount and value of pig iron produced, distinguishing the pig iron produced from British and from foreign ores:

		Coal	Pig iron	
			British	Foreign
1900	 tons	225,181,800	4,666,942	4,292,749
	 £	121,652,596	19,596,910	18,025,639
1905	 tons	236,128,936	4,760,187	4,847,899
	 £	82,088,553	14,992,368	15,268,619
1910	 tons	264,433,028	4,975,735	5,036,363
	 £	108,377,567	17,008,812	17,216,059
1911	 tons	271,891,899	5,020,510	4,505,762
	 £	110,783,682	16,146,340	14,490,872
1912	 tons	260,416,338	4,451,636	4,299,828
	 £	117,921,123	16,419,298	15,859,372
1913	 tons	287,480,473		
	 £	145,535,669		

In 1914 the coal output amounted to 253,195,000 tons. The value of metals, aside from iron, produced from British ores in 1912 was as follows: white tin, £1,116,738; lead, £349,561; zinc, £158,622; fine copper, £22,714; silver, £14,382; gold, £5103.

FISHERIES. Wet fish (exclusive of salmon and shell fish) landed on the coasts of the United Kingdom in 1912 amounted to 24,092,862 cwts.; in 1913, 24,657,116 cwts. The values are stated at £12,779,717 and £14,229,311 respectively. The herring catch in 1913 was valued at £4,572,295; cod, £2,300,119; hake, £678,981; soles, £474,127. The value of shell fish landed in 1912 was £454,709, and in 1913 £463,642.

COMMERCE. Returns of trade shown below

for the year 1914 are subject to slight revision. Total imports, imports reexported, and net imports (that is, imports for home consumption) have been valued as follows (exclusive of specie and bullion, of foreign merchandise transhipped under bond, and of diamonds from the Union of South Africa):

	Total imports	Reexports	Net imports
1905	 £2565,019,917	£ 77,779,913	£2487,240,004
1910	 678,257,024	103,761,045	574,495,979
1912	 744,640,631	111,737,691	632,902,940
1913	 768,734,739	109,575,037	659,159,702
1914	 697,432,649	95,489,586	601,943,063

In 1910 imports of gold and silver specie and bullion amounted to £71,422,077; in 1912, £69,467,185; in 1913, £74,028,598; in 1914, £62,596,632. Total exports, reexports of foreign and colonial produce, and domestic exports (that is, exports of British produce) have been valued as follows (exclusive of specie and bullion and of foreign merchandise transhipped under bond):

	Total exports	Reexports	Dom. exp.
1905	 £2407,596,527	£77,779,913	£2329,816,614
1910	 534,145,817	103,761,045	430,384,772
1912	 598,961,130	111,737,691	487,223,439
1913	 634,820,326	109,575,037	525,245,289
1914	 525,720,311	95,489,586	430,230,725

Exports of gold and silver specie and bullion in 1910 amounted to £64,724,213; in 1912, £64,871,488; in 1913, £62,142,038; in 1914, £41,488,125.

Total imports of merchandise, domestic exports of merchandise, and foreign and colonial exports of merchandise in 1913 and 1914 are shown by classes in the following table, in thousands of pounds sterling (figures for 1914 subject to revision):

	Total Imports		Dom. Exports		Foreign and Colonial Exports	
	1913	1914	1913	1914	1913	1914
I. Food, drink, and tobacco:						
Grain and flour	85,495	79,685	3,562	3,101	1,655	2,577
Meat, including animals for food	56,726	63,101	1,239	1,140	2,180	2,791
Other food and drink			24,411	18,988		
1. Non-dutiable	81,265	78,513			5,630	4,478
2. Dutiable	58,683	69,150			6,262	7,324
Tobacco	8,003	7,491	8,376	8,707	265	276
Total	290,202	297,940	32,588	26,936	15,942	17,446
II. Raw materials and articles mainly unmanufactured:						
Coal, coke, and manufactured fuel	37	41	53,660	42,201	8	1
Iron ore, scrap iron, and steel	7,433	5,488	411	299	9	12

Total, including others 744,640 768,735 598,961 634,820

* Including Federated Malay States. † Imports do not include diamonds. ‡ Including Formosa.

SHIPPING. The total net tonnage (exclusive of the coasting trade) entered at the ports, with cargo and in ballast, was 76,190,616 in 1912 and 82,148,569 in 1913; cleared, 76,266,429 and 82,661,012. The British tonnage entered in 1912 was 44,291,842, and in 1913, 46,602,920; German, 7,761,144 and 9,073,855; Norwegian, 5,523,796 and 5,883,316; Swedish, 2,991,136 and 3,400,660; Dutch, 3,027,243 and 3,169,375; Danish, 2,987,971 and 3,149,675; French, 1,888,246 and 2,248,981. In 1913, the British merchant marine consisted of 12,602 steamers, of 18,683,039 tons gross, and 8336 sail, of 846,504 tons gross; total,

20,938 vessels, of 19,529,543 tons gross. In 1913, 909 steamers, of 1,170,107 tons net, and 338 sail, of 30,382 tons net, were built in the United Kingdom, exclusive of warships; the warship tonnage built was 193,785 for the British navy and 55,024 for the navies of other countries.

COMMUNICATIONS. The length of railway open to traffic in the United Kingdom on Dec. 31, 1914, was 23,701 miles, as compared with 23,691 miles at the end of 1913, and 23,205 at the end of 1912. The paid-up capital, Dec. 31, 1914, was £1,421,848,000; total receipts during the year, £139,098,000; working expenses, £88,173,000; net receipts, £50,925,000 (£52,011,000 in 1913). The length of tramway and light railway at the end of 1913 was 2675 miles; paid-up capital, £77,198,680; net receipts, £5,588,121.

A summary for the year 1914, with comparative figures for 1913, was issued during the year by the commercial department of the British board of trade and gave the following statistics of the railways of the United Kingdom, for the calendar year 1914, with comparative figures for the previous year. It was stated that on account of the war no further statistics for the year would be published.

<i>Mileage of Lines Open for Traffic.</i>	<i>1914</i>		<i>1913</i>	
	<i>Miles</i>	<i>Miles</i>	<i>Miles</i>	<i>Miles</i>
Running Lines:				
First track	23,701	23,691

Expenditure	428,520,780	424,375,200
Net income	\$247,495,500	\$253,356,660

† Including nominal additions to the amount of \$142,470,900 which were excluded from the total for 1913.
‡ Including the estimated amount receivable by the companies, under agreement with the government, in respect of the control of British railways during the period from August 5 to December 31.

According to the railway returns for 1913, there were on December 31st of that year 12,118 tender engines, 8697 tank engines, and 12,315 tenders on the railways of England and Wales; 2043 tender engines, 806 tank engines, and 2049 tenders in Scotland, and 631 tender engines, 340 tank engines, and 607 tenders in Ireland.

The first application in the British Isles of electric locomotives for heavy goods traffic was inaugurated on the North-Eastern Railway on the electrified section from Shildon to Newport. This electrified line has no steep grades, and the traffic consists of heavy freight for the blast furnaces at Erimus sidings, Newport, near Middlesborough. An overhead system is employed with two bow collectors on each locomotive. There were 10 locomotives, which are eight-wheeled, with a motor driving each axle, and capable of hauling a load of 1000 tons. The power is supplied at 1500 volts to the overhead conductors, which will be about 17½ feet above rail level. The first section of the London and South-Western Railway's newly electrified lines from Waterloo Station, in London, to Wimbledon (through East Putney), was opened for traffic on Oct. 25, 1915, while the second portion of the electrified system, which includes Waterloo, Barnes, Richmond, Kingston, Wimbledon, Clapham Junction, Waterloo, was nearly ready for operation at that time. Up to Aug. 31, 1915, 92,658 employees of the railways of the United Kingdom had enlisted in the British army, this being not less than 14.9 per cent of the total 621,588 men who were employed at the beginning of the war.

On March 31, 1913, there were 75,042 miles of state telegraph and telephone line, with 2,661,378 miles of wire. Post offices, March 31, 1914, 24,447.

FINANCE. The monetary unit is the pound sterling, whose par value is \$4.86656. Ordinary revenue (actual receipts into the exchequer) and ordinary expenditure (actual issues out of the exchequer chargeable against revenue) have been as follows, in years ended March 31st: in 1900, £129,804,566 and £143,687,068; in 1905, £153,182,782 and £151,768,875; in 1910, £131,696,456 and £157,944,611; in 1912, £185,090,286 and £178,545,100; in 1913, £188,801,999 and £188,621,930; in 1914, £198,242,897 and £197,492,969. The table below shows receipts into the exchequer, under the principal heads thereof, in the fiscal years 1913 and 1914:

Revenue	1912-13	1913-14
Customs	£ 33,485,000	£ 35,540,000
Excise	88,000,000	89,590,000
Estate, etc., duties.....	25,248,000	27,359,000
Stamps *	10,059,000	9,966,000
Land tax	700,000	700,000
House duty	2,000,000	2,000,000

Revenue	1912-13	1913-14
Property and income tax.....	44,806,000	47,249,000
Land value duties.....	455,000	715,000
Tax revenue	£154,758,000	£163,029,000
Postal service.....	£ 20,300,000	£ 21,190,000
Telegraph service	3,100,000	3,080,000
Telephone service	5,755,000	6,530,000
Crown lands (net).....	580,000	530,000
Receipts from Suez Canal shares and sundry loans	1,418,900	1,579,972
Fee and patent stamps...	1,066,000	1,078,000
Receipts by civil departments, etc.	1,859,099	1,225,925
Total revenue	£188,801,999	£198,242,897
* Exclusive of fee and patent stamps.		

Receipts into the exchequer in 1914-15 and the estimates for 1915-16 are as follows:

Revenue	1914-15	1915-16
Customs	£ 38,662,000	£ 38,950,000
Excise	42,313,000	56,250,000
Estate, etc., duties.....	28,382,000	28,000,000
Stamps *	7,577,000	6,500,000
Land tax	630,000	860,000
House duty	1,930,000	1,990,000
Property and income tax.....	69,399,000	103,000,000
Land value duties.....	412,000	350,000
Tax revenue	£189,305,000	£235,700,000
Postal service	£ 20,400,000	£ 20,600,000
Telegraph service	3,000,000	3,100,000
Telephone service	6,250,000	6,700,000
Crown lands (net).....	545,000	530,000
Receipts from Suez Canal shares and sundry loans	1,277,000	2,002,000
Miscellaneous	5,917,000	1,700,000
Total non-tax revenue.....	£ 37,389,000	£ 34,632,000
Total revenue	£226,694,000	£270,332,000
* Exclusive of fee and patent stamps.		

Issues out of the exchequer in the years 1913-14 and 1914-15 are reported as follows:

Expenditure	1913-14	1914-15
National debt services....	£ 24,500,000	£ 23,500,000
Road improvement fund.....	1,394,951	1,545,000
Payments to local taxation accounts, etc.	9,734,128	9,885,000
Other consolidated fund services	1,693,890	1,706,000
Army	28,346,000	28,885,000
Navy	48,833,000	51,550,000
Civil services *	53,901,000	58,885,000
Revenue departments	4,483,000	4,741,000
Postal service	24,607,000	26,227,000
Total expenditure	£197,492,969	£206,924,000
Expenditure against capital	4,220,749	5,265,000

* Including expenditure on education, science, and art (£19,450,000 in 1913-14) and old-age pensions, etc. (£19,666,000 in 1913-14).

It will be seen that in 1914-15 the issues out of the exchequer, £206,924,000, aggregated less than the revenue, £226,694,000; but between the outbreak of the war in August, 1914, and the end of the fiscal year, Mar. 31, 1915, votes of credit were taken amounting to £362,000,000. The war budget submitted by the chancellor of the exchequer on Sept. 21, 1915, shows estimated revenue for the fiscal year 1916 amounting to £272,000,000, a sum a little larger than the total given in the table above. The expenditure was estimated at £1,590,000,000, the estimated deficit being £1,318,000,000. See paragraph *The Budget* under section *History*.

On Nov. 15, 1915, the prime minister moved a vote of credit for £400,000,000, this amount rais-

ing the total of the five votes taken up to that time during the fiscal year (that is, since April 1st) to £1,300,000,000. Add to this sum the total of the votes of credit between August, 1914, and March 31, 1915, and the total votes of credit during the war up to Nov. 15, 1915, are seen to be £1,662,000,000. And the fiscal vote of credit was expected to carry the war only to the middle of February, 1916.

The nominal amount of the funded debt on March 31, 1914, was £586,717,872; estimated capital liability in respect of terminable amenities, £29,552,219; unfunded debt, £35,000,000 (including treasury bills temporarily paid off, but renewable not later than June 30); total "dead-weight" debt, £651,270,091. The net increase of the debt during 1914-15 was £457,546,985, so that on March 31, 1915, the "dead-weight" debt was £1,108,816,076. And it was expected that a sum about double this amount would represent the "dead-weight" debt on March 31, 1916.

ARMY. See MILITARY PROGRESS, *passim*.

NAVY. Additions to the navy since the beginning of the war in August, 1914, cannot be stated. The following statement issued by the Office of Naval Intelligence at Washington relates to July 1, 1914. Number and displacement of warships of 1500 or more tons, and of torpedo craft of 50 or more tons, built and building: Dreadnoughts (battleships having a main battery of all big guns, that is, 11 or more inches in calibre): built, 20, of 423,350 tons; building, 16, of 421,750 tons. Pre-dreadnoughts (battleships of about 10,000 or more tons, whose main batteries are of more than one calibre): built, 40, of 589,385 tons; building, none. Coast-defense vessels (smaller battleships and monitors), none built or building. Battle cruisers (armored cruisers having guns of largest calibre in main battery and capable of taking a place in line of battle with the battleships): built, 9, of 187,800 tons; building, 1, of 28,500 tons. Armored cruisers: built, 34, of 406,800 tons; building, none. Cruisers (unarmored warships of 1500 or more tons): built, 74, of 382,815 tons; building, 17, of 67,000 tons. Torpedo-boat destroyers: built, 167, of 125,850 tons; building, 21, of 21,770 tons. Torpedo boats: built, 49, of 11,488 tons; building, none. Submarines: built, 75, of 30,362 tons; building, 22, of 17,236 tons. Total tonnage: built 2,157,850; building, 556,256. Excluded from the foregoing: ships over 20 years old from date of launch unless reconstructed and rearmed within five years; torpedo craft over 15 years old; ships not actually begun or ordered although authorized; transports, colliers, repair ships, torpedo-depot ships, and other auxiliaries. The active personnel, July 1, 1914, was reported at 150,609 officers and men. See also NAVAL PROGRESS.

GOVERNMENT. The executive authority is vested in the King, acting through his ministers. The legislative power devolves upon the Parliament, which consists of the House of Lords and the House of Commons. The peers entitled to sit in the House of Lords in 1915 numbered 654, including the lords spiritual and temporal, and three princes of the blood royal. The second Parliament of George V, which convened Jan. 31, 1911, had 670 members in the House of Commons. England is represented by 465 members, Wales 30, Scotland 72, and Ireland 103.

The King in 1915 was George V, born June 3, 1865; he succeeded to the throne May 6, 1910,

as the second but only surviving son of Edward VII. He married July 6, 1893, Princess Victoria Mary, only daughter of the late Duke of Teck. Heir-apparent, Edward Albert, Prince of Wales, born Dec. 14, 1895.

HISTORY

THE GOVERNMENT'S TASK. The endeavors of the government to find money, men, and munitions for the prosecution of the war constituted the outstanding feature of British politics during the year 1915. It was comparatively easy to supply the money, although the increasing burden of the war debt might well give rise to solicitude for the future. Guns and ammunition were less readily obtained: the construction of new munition factories and the organization of the industry entailed painful delay, and the rules of the trade-unions hampered the work. Even more arduous was the task of suddenly creating an enormous army without doing violence to the cherished traditions of the people by establishing compulsory military service. These three great problems—finance, the supply of munitions, and the recruitment of the army—are separately discussed in the paragraphs that follow.

THE COST OF THE WAR. Providing the huge sums required to defray her own and part of her allies' expenses in the war was the least of Great Britain's difficulties. In his budget speech of May 4th, the chancellor of the exchequer, Mr. David Lloyd George, informed the House of Commons that the daily cost of the war to Great Britain, not including the sums advanced to colonies and allies, then stood at about £2,100,000 a day. The total expenditure for the year 1915-16, if the war continued, would amount to about £1,322,654,000—more than double the expenditure for 1914-15. About one-third of this sum would be raised by taxation; the deficit would be no less than £862,322,000, and would have to be raised by internal loans. The estimate of the war's cost made by Mr. Lloyd George in May was soon exceeded in fact. Hardly a month after Lloyd George had stated the daily expenditure to be £2,000,000, Mr. Asquith announced that the daily cost had risen to an average of £2,660,000, and that during the next three months at least £3,000,000 a day would be expended. At the request of the government, Parliament authorized an issue of securities up to a maximum total of £1,000,000,000, at 4½ per cent interest. In order to induce the middle and lower middle classes to invest, five shilling shares of the new loan were offered on sale at post offices. The effect of the war expenditure upon Great Britain's economic life was explained by Mr. Asquith in a speech in the Guildhall June 27th. Before the war, the annual income of the nation had attained a figure somewhere between £2,250,000,000 and £2,400,000,000; the annual expenditure of the nation was estimated at about £2,000,000,000. Thus there was a surplus of from £250,000,000 to £400,000,000 which could be saved or invested, and which would ordinarily be available for the purchase of government loans. But the amount needed for the war was now £1,000,000,000 a year. The balance of trade, moreover, had turned against Great Britain. Comparing board of trade statistics for the first five months of the year 1915

with those for the same period a year ago, it appeared that imports had increased by £35,500,000 while exports and re-exports had fallen off by £73,750,000. These figures signified, the speaker went on to say, that in five months nearly 110 millions sterling had been added to Great Britain's foreign obligations, "and if that rate continued until we reached the end of a completed year, the figure of our indebtedness would rise to over 260 millions." In order to correct this balance of trade, imports of luxuries must be rigorously curtailed; tea, tobacco, wine, sugar, and petrol must be used sparingly, if at all; and the nation must learn thrift and save money to invest in the war loans. In this connection it may not be amiss to remark that the need for economy was hardly less pressing in England than in Germany, for although the seas remained free to British trade, the cost of living had increased at an alarming rate. In London the price of wheat had risen from 34s. 11d. just before the war to 45s. at the beginning of the year 1915.

KITCHENER'S ARMY. The result of Lord Kitchener's labors as minister of war, in raising, drilling, and equipping a vast volunteer army to reinforce the puny original expeditionary force of three army corps, was indicated in April when the chancellor of the exchequer, Mr. David Lloyd George, speaking in the House of Commons, revealed the fact that altogether 36 divisions or about 750,000 men had been sent to the front. "Kitchener's army" was a wonderful achievement, in the face of almost insuperable obstacles, such as the difficulty of raising a large army on a purely voluntary basis, and the absence at the outset of any organization or equipment adequate to deal with such numbers of men. Nevertheless when "Kitchener's army" was compared with Joffre's army, and the length of the battle line held by British troops was compared with the length held by the French, it was patent that Great Britain was not doing her full share. Two or three million men were needed. Hints of conscription were heard. Newspaper correspondents asserted that complaints were being raised in France at England's failure to furnish a larger contingent. On May 18th Lord Kitchener issued a call for 300,000 new recruits. In June Premier Asquith announced that the total number of men for army and navy sanctioned by Parliament—3,200,000—would not be exceeded without the authority of Parliament. Meanwhile enlistment continued regularly, but without the alacrity and spontaneous enthusiasm which might have been desired. It was necessary for eloquent speakers to tour the country, addressing mass meetings, to urge young men to enlist. Still recruiting lagged. On August 15th a National Register or census was taken of all persons, of both sexes, between the ages of 15 and 65, so that the government might have exact information of the numbers available both for service in the army and for labor in munitions factories. On the following day, August 16th, the journals owned by Lord Northcliffe opened a campaign in favor of compulsory "National Service." The *London Times* published a manifesto in favor of National Service, signed by a number of prominent men, including Sir F. G. Banbury, Lord Charles Beresford, the Bishop of Birmingham, Lord Denman, Sir Edward Elgar, Sir Rider Haggard, Sir Starr

Jameson (author of the "Jameson Raid"), Lord Northcliffe, Sir Arthur Pinero, and Sir William Ramsay. The *Daily Mail* published the same manifesto, accompanied by a furious editorial attack upon voluntary service, and a suggestion that local committees organize mass meetings to demand compulsion. From the middle of August to the end of the year, the campaign for National Service increased in intensity, and the hot debate between advocates of compulsion and defenders of free enlistment loomed larger and larger upon the political horizon.

THE SHORTAGE OF MUNITIONS. More serious than either the question of finance or the difficulty of recruiting was the shortage of munitions. According to a statement made by Mr. David Lloyd George in the House of Commons, Great Britain had made wonderful progress in manufacturing artillery ammunition: if 20 be taken as representing the output in September of 1914, in October the output was 90; in November, 90; in December, 156; in January, 186; in February, 256; in March, 388. Still the supply was insufficient, and the shortage of munitions was undeniable. On March 15th Lord Kitchener gravely warned the House of Lords that "the work of supplying and equipping new armies depends largely on our ability to obtain the war material required." Armament firms, to be sure, and most of the employees had responded nobly to the demands laid upon them, but still the minister of war was obliged to admit that "the output is not only not equal to our necessities, but does not fulfill our expectations." Orders had not been filled on time. The lack of labor was hampering the munitions factories. Idleness, slack work, drunkenness, and trade-union restrictions were responsible for the dire plight in which the nation found itself, in so far as they hindered work on munitions orders. Perhaps the laboring classes were misled by the fatuous confidence in Great Britain's ability to win the war without half trying, Lord Kitchener suggested. His only comment on such confidence was this: "I can only say that the supply of war material at the present moment and for the next two or three months is causing us very serious anxiety, and I wish all those engaged in the manufacture and supply of these stores to realize that it is absolutely essential not only that the arrears in the deliveries of our munitions of war should be wiped off, but that the output of every round of ammunition is of the utmost importance and has a large influence on our operations in the field." A new Defense of the Realm Bill, which was being submitted to the consideration of the House, would help, Lord Kitchener hoped, to expedite the manufacture of munitions. As for the complaint of the laborers that they were unjustly treated, Lord Kitchener observed, "Labor may very rightly ask that their patriotic work should not be used to inflate the profits of the directors and shareholders of the various great industrial and armament firms, and we are therefore arranging a system under which the important armament firms will come under government control, and we hope that workmen who work regularly by keeping good time shall reap some of the benefits which the war automatically confers on these great companies." The new Defense of the Realm Act, submitted to Parliament in March, to which the war minister referred, gave the government power to

JAMES KEIR HARDIE
 Labor Leader in House of Commons
 Died September 26, 1915

Admiral SIR HENRY R. BRADWARDINE JACKSON

FOUR FIGURES PROMINENT IN GREAT BRITAIN IN 1915

take and exercise control over manufactories capable of being used for the manufacture of munitions, as well as over factories already engaged in that work. In the hope of securing more loyal coöperation from the laborers, Mr. Lloyd George and Mr. Runciman (president of the board of trade) conferred with representatives of the trade unions, March 17th and March 19th. The agreement was reached that (1) during the war there was to be no stoppage of work on the munitions and equipment ordered by the government; (2) disputes were to be settled by conferences between the men and their employers, or in case of deadlock referred either to the Committee on Production, to a single arbitrator appointed by the board of trade, or to a Court of Arbitration representing equally capital and labor; (3) an advisory committee representing the munitions workers was to be appointed by the government; (4) trade-union regulations, especially the restrictions upon the employment of semi-skilled and female labor in union shops, were to be relaxed during the war, on the assurance that no diminution of pay would result from the introduction of cheaper labor. During March also a strong movement was set on foot to restrict or prohibit the use of alcohol, so that the labor of the munitions workers would be more efficient. King George himself set an example to the nation in this respect by announcing, the first week in April, that henceforth the use of alcoholic beverages would be prohibited in the royal household. In May the Parliament authorized the government to regulate the sale of liquor in areas where the munitions of war were being made, and a Central Board of Control was nominated, under the chairmanship of Lord D'Abernon. In spite of the measures taken by the government to increase the output of munitions, the shortage continued to cause complaint and criticism in the press. The London *Times'* military correspondent asserted May 12th that in attacks at Fromelles and Richebourg, "the want of an unlimited supply of high explosive was a fatal bar to our success." To break through the hard crust of the German line in France and Belgium, he asserted, "we need more high explosives, more heavy howitzers, and more men."

ATTITUDE OF THE INDEPENDENT LABOR PARTY. The difficulty experienced by Great Britain in meeting the demand for more men and more munitions was partly due to the attitude of the laboring classes. The Socialist Independent Labor Party, although representing only a fraction of organized labor, was influential in propagating doubt as to the justice of Great Britain's cause, and in raising the question in the minds of at least a few workingmen, whether after all democracy was to be furthered by waging war in alliance with the Tsar. A conference of the Independent Labor Party met at Norwich, April 5th, reflected Mr. Jowett as chairman, and by an almost unanimous vote resolved: "That this conference expresses its strong disapproval of the action of the Labor Party [the Labor Party, it should be noted, represented the bulk of the trade unions, whereas the Independent Labor Party represented the Socialist minority] in taking part in a recruiting campaign, and of Independent Labor Party members of Parliament speaking from platforms on which attempts were made to justify the war and the foreign policy of the Liberal government which

led up to the war." While they were at Norwich, many of the Independent Labor Party delegates attended the meeting of the Union of Democratic Control, whose object was to abolish secret and undemocratic diplomacy. Mr. Ramsay McDonald, who presided over the meeting, declared that Russia was fighting for power in the Balkans and France for revenge; that Prussian militarism could not be crushed by war, but must be destroyed from within. This extremely diffident attitude towards the war, let it be repeated, was not shared by the majority of the workingmen. Nevertheless it must be admitted that a very widespread discontent was manifested, chiefly as a result of the increase in the cost of living without a simultaneous commensurate increase of wages. During the period from January to May, 286 labor disputes, strikes, or lockouts were reported, affecting 109,693 men. Two-thirds of the strikes were caused by the demand for higher wages, and at least 12 by the attempt of employers to maintain the "open shop" system. The total time lost amounted to 762,900 days. In the coal-mines, and in the munitions industry, the workers complained that they were being forced to work long hours, without an adequate increase of pay, while the cost of living had increased, and the employers were enjoying unprecedented profits. Any attempt on the part of the government to coerce munitions workers, or to introduce compulsory military service, would encounter the most stubborn opposition from organized labor.

THE COALITION CABINET. In May a cabinet crisis was precipitated by the quarrel (see below, *Churchill's Resignation*) between Winston Spencer Churchill, first lord of the admiralty, and Lord Fisher, first sea lord. The latter resigned May 14th; at the same time Mr. Churchill offered to resign. In view of the demand which had of late become insistent, that the Opposition be allowed some voice and some responsibility in the cabinet during the war, Mr. Asquith decided to take this opportunity for the reconstruction of the cabinet and the formation of a Coalition government. Lord Haldane, Lord Beauchamp, Mr. Hobhouse, Mr. Herbert Samuel, Mr. Pease, Mr. Montagu, Lord Lucas, and Lord Emmot were asked to resign their posts, and in their stead eight Unionists were brought into the cabinet. By creating 2 new places in the cabinet, bringing the total up to 32, room was made for a Labor member and another Liberal; so that the Coalition cabinet included 12 Liberals, 8 Unionists, 1 Labor member, and Lord Kitchener. The apportionment of portfolios, as announced May 25th, was as follows: Prime minister and first lord of the treasury, Mr. Asquith (Liberal); minister without portfolio, Lord Lansdowne (Unionist); lord chancellor, Sir S. Buckmaster (Liberal); lord president of the council, Lord Crewe (Liberal); lord privy seal, Lord Curzon (Unionist); chancellor of the exchequer, Mr. Reginald McKenna (Liberal); secretary of state for home affairs, Sir John Simon (Liberal); secretary of state for foreign affairs, Sir Edward Grey (Liberal); secretary of state for colonies, Mr. Andrew Bonar Law (Unionist); secretary of state for India, Mr. J. Austen Chamberlain (Unionist); secretary of state for war, Lord Kitchener; minister of munitions (a newly created port-

folio), Mr. David Lloyd George (Liberal); first lord of the admiralty, Mr. Arthur J. Balfour (Unionist); president of the Board of Trade, Mr. Walter Runciman (Liberal); president of the Local Government Board, Mr. Walter Hume Long (Unionist); chancellor of the Duchy of Lancaster, Mr. Winston Spencer Churchill (Liberal); resigned November, 1915, succeeded by Mr. Herbert Samuel (Liberal); chief secretary for Scotland, Mr. McKinnon Wood (Liberal); president of the Board of Agriculture and Fisheries (not previously a cabinet office), Lord Selborne (Unionist); first commissioner of works, Mr. Lewis Harcourt (Liberal); president of the Board of Education, Mr. Arthur Henderson (Labor); attorney-general, Sir Edward Carson (Unionist), resigned October, 1915, succeeded by Sir Frederick Edwin Smith (Unionist); chief-secretary to the lord-lieutenant of Ireland, Mr. Augustine Birrell (Liberal). Outside of the cabinet, important ministerial positions were assigned to Mr. H. Samuel (postmaster-general), Mr. F. E. Smith, (solicitor-general), and Mr. Montagu (financial secretary to the treasury). In respect of the new cabinet, it should be noted that Unionists were placed in charge of India, the colonies, the navy, and agriculture; that the Labor member, Mr. Henderson, on the other hand, was not assigned to a post where his partisan convictions were likely to find expression; that Mr. Winston Churchill was removed from the admiralty and given a post without special responsibility; that the Irish Nationalist leader, Mr. Redmond, although offered a place in the Coalition cabinet, refused to accept a government office while Home Rule was still denied to Ireland, and an Ulster Unionist (Sir Edward Carson) sat in the cabinet; and, finally, that after seven historic years as chancellor of the exchequer, Mr. David Lloyd George, the eloquent Welsh land-reformer, resigned the ministry of finance into the hands of Mr. McKenna, and undertook a new and arduous responsibility as minister of munitions. Of interest to students of constitutional history was the bill introduced immediately after the formation of the Coalition government, to render the reelection of newly appointed cabinet officers unnecessary during war time. The reason which led to this important departure from a venerable precedent was the obvious inexpediency of requiring a newly appointed minister to undertake an electoral campaign, distracting his attention from his ministerial functions, just at the time when his undivided energies were demanded by the nation.

LLOYD GEORGE AND MUNITIONS. The bill to establish and define the powers of the minister of munitions was introduced in the House of Commons the first week in June, by the home secretary, Sir John Simon. The extraordinary character of the powers which the bill conferred upon the new minister evoked violent criticism in the House of Commons, June 7th. Mr. Pringle (Liberal) expressed his abhorrence of the provisions which, he claimed, would give the minister of munitions power to "socialize" labor. A Labor member, Mr. Philip Snowden, vigorously opposed compulsion and "forced labor." An Irish Nationalist believed that the bill would force "slavery" upon the working classes, and demanded to know of what avail it would be to destroy German militarism, if liberty were deliberately abolished in the United

Kingdom; Mr. Hobhouse warned the government against introducing compulsory labor. Mr. Crooks (Labor) expressed the fear that "conscript labor" was contemplated. Sir John Simon quelled the storm of criticism by disclaiming any intention on the part of the government to impose any compulsion upon labor. In course of the debate Sir R. Cooper made the astonishing statement that he had offered, as long ago as April 21st, to supply 5,000,000 shells, and desired to know why his offer was not accepted. Despite hostile criticism, the Ministry of Munitions Bill was passed by both Houses of Parliament and received the royal assent, June 9th. With an energy that promised well for the future, Mr. David Lloyd George now threw himself into the work of his new department. On June 23rd he came forward with a Munitions Bill, which embodied the chief points of his programme: (1) Strikes and lockouts were to be made illegal in the munitions plants, and industrial disputes were to be settled by compulsory arbitration; (2) the short-sighted policy which had permitted skilled workers to be drafted into the army from the munition plants was now to be reversed, and the skilled munitions workers who had enlisted were to be brought home again; (3) seven days were to be allowed for the voluntary enrollment of skilled men in a mobile munition corps, the enrollment being conducted by the trade unions, and the recruits being given a certificate instead of a uniform to show that they were engaged in patriotic service; (4) government control over munitions workshops was to be established, "slackers" were to be fined, and a Munitions Court was to be constituted; (5) trade union regulations, in so far as they hampered the work, were to be suspended; and (6) employers' profits were to be limited. During the debate on the Munitions Bill, an important revelation was made by Mr. Pease, former minister of education. The government at the beginning of the war, he affirmed, had no idea of the large proportion of high explosives or the number of machine-guns or the type of hand grenade which would be used in trench-warfare. Lord Kitchener, he implied, had been more far-seeing than the other ministers, and had continually urged the necessity of providing in advance for the materials which might be required in a long and stubbornly contested war. The Munitions Bill was finally passed by Parliament the first week in July, with an amendment somewhat weakening the government's power to enforce the arbitration of industrial disputes. By July 12th 90,000 men had been enrolled as munitions workers under the new plan. By July 28th 16 national munitions factories had been established in England, and 10 more, it was announced, would soon be erected. Early in August a board of 25 scientists and engineering experts was created to examine inventions and improved appliances for the munitions ministry. On August 12th the minister announced that in addition to the "national" munitions plants, 345 "controlled establishments" were engaged on government work. In "controlled establishments" the owner, for his part, consented to turn his excess profits over to the national exchequer, while the workmen consented to suspend restrictive trade-union regulations. In September it became evident that the government was living up to the provision of the Mu-

nitions Bill which provided for the establishment of Munitions Courts to fine delinquent workmen. A large number of Cammell, Laird and Company's men were fined for loss of time, the aggregate loss of time in 20 weeks having amounted to about 1,500,000 hours, and the fines varying from 5 to 60 shillings. The result of a little more than two months' work on the part of the able minister of munitions was indicated on September 15th, when the government announced that 715 munitions factories, employing 800,000 workmen, had been constituted as "controlled establishments," and in addition the ministry of munitions had constructed 20 shell factories and was constructing 18 more.

LABOR DIFFICULTIES. In September the failure of the government to enlist the hearty sympathy and support of the laboring classes began to cause grave concern. Strikes in the Welsh coal mines threatened to tie up industry in general and to cripple the munitions trade in particular. (For further information regarding the strike see **STRIKES AND LOCKOUTS**, *Great Britain*.) The minister of munitions, moreover, found that his most eloquent appeals were unavailing to secure a sufficient supply of labor for his munitions factories. In order to stir up enthusiastic patriotism, delegations of workers were sent to visit the front. The first of these delegations, upon its return, issued an appeal to labor—"We have brought the needs of your fellow workmen at the front before you . . . and we expect and believe you will not fail them." Mr. Lloyd George in person attended the Trade Union Congress, September 9th, so that he might answer the complaints of the trade unionists. In reply to the charge that the munitions workers were being forced to work overtime for the profit of the factory-owners, Mr. Lloyd George pointed to the national arsenals which had been established, and the limitation which had been imposed on profits in "controlled establishments." He in his turn complained that by insisting upon the strict observance of their rules, the trade unions were fatally hampering a most vital work. For example, at Woolwich Arsenal the engineers had refused to allow semi-skilled persons to do the work of qualified mechanics. In South Wales, the unions had refused to permit the operation of lathes by semi-skilled workers. In a large tool-making firm the workers had vetoed the employment of women to operate lathes. Such restrictions on the employment of unskilled labor must be abandoned during the war; and the unions must help the government to find the 80,000 skilled workmen and the 200,000 unskilled laborers who were urgently needed for munitions work. Owing to the shortage of labor, Mr. Lloyd George said, at least 15 per cent of the machines for turning out rifles, cannon, and shells were standing idle every night. "If the attitude of the Woolwich engineers is to be adhered to," he declared, "we are making straight for disaster." The same warning was repeated by Mr. Lloyd George in December, when he said that success or failure in the war depended upon his securing permission from organized labor to recruit 200,000 unskilled workers for the munitions plants.

IRISH HOME RULE AND WELSH DISESTABLISHMENT. Since the Irish Home Rule Bill had not yet come into operation, although passed for a

third time by the House of Commons in 1914 (consult the *YEAR BOOK* for 1914) in accordance with the provisions of the Parliament Act, a certain amount of solicitude was expressed in Ireland lest a Unionist ministry, coming into power during the war, might strike the act from the statute book and cheat Ireland of the boon for which the Irish Nationalists had so stubbornly fought. The emotions may well be imagined with which the Nationalists contemplated the establishment of the Coalition ministry, in which Sir Edward Carson, the leading antagonist of Home Rule, occupied an honorable position. By the Suspensory Act of September, 1914 (consult the *YEAR BOOK* for 1914, *GREAT BRITAIN, History, The War and the Irish Question*), the Irish Home Rule Act had been suspended until the expiration of 12 months from the date of passing, i.e. until Sept. 18, 1915, or "until such later date (not being later than the end of the present war) as may be fixed by His Majesty by Order in Council." The anticipation of the Irish Nationalists that the Coalition cabinet, instead of permitting the act to come into effect in September would take advantage of the loophole permitting a further suspension, was realized when on Sept. 14, 1915, the government published an Order in Council as follows: "If at the expiration of 12 months from the date of the passing of the said acts (Irish Home Rule and Welsh Disestablishment) the present war is not ended—(1) No steps shall be taken to put the Government of Ireland Act, 1914, into operation until the expiration of 18 months from the date of the passing of that act unless the present war has previously ended, nor if at the expiration of those 18 months the present war has not ended until such later date, not being later than the end of the present war, as may hereafter be fixed by Order in Council. (2) The date of disestablishment under the Welsh Church Act, 1914, shall be postponed until the end of the present war."

FURTHER WAR CREDITS. When the House of Commons reassembled, September 14th, after its summer recess, it was called upon to consider two principal problems, finance and recruiting. The *London Times* editorially remarked, "Upon its (Parliament's) decisions during the next few weeks may depend the fortunes of the war and the future of the civilized world." A war credit of £250,000,000 was demanded by Premier Asquith, September 15th, to cover expenses up to November 15th. The total credits to date amounted to £1,262,000,000, since Aug. 6, 1914. The government, it was announced, had repaid £50,000,000 to the Bank of England, and had lent £28,000,000 to the dominions, £250,000,000 to other belligerents, and £30,000,000 to other foreign governments. The average daily cost of the war had shown a steady tendency to rise, from £2,700,000 during the period from April 1st to June 30th, to £3,000,000 from July 1st to July 17th, and £3,500,000 from July 17th to September 11th. During the next month Great Britain's gross daily expenditure would not exceed, on the average, £5,000,000.

RECRUITING. In asking for the new credit, Mr. Asquith made the important but very vague statement that from first to last, including both army and navy, "not far short of 3,000,000 men" had offered themselves for service. The total casualties numbered 380,000, although

many of these had been slight wounds from which recovery was speedy. In the House of Commons the debate on the war credits became a debate on conscription. In the House of Lords, September 15th, Lord Kitchener, while expressing his satisfaction at the "large increase in the number of heavy guns" which had been supplied, and reporting that 11 new divisions had been sent to occupy an additional 17 miles of the front in France, acknowledged that recruiting had recently declined, and anxious consideration was being given to the best means of securing recruits.

LABOR OPPOSITION TO CONSCRIPTION. While Parliament and the press in September seemed to incline towards compulsory military service as a solution for the recruiting problem, organized labor put itself on record as absolutely opposed to any such scheme. On September 7th, the Trade Union Congress at Bristol resolved: "That we, the delegates to this Congress, representing nearly 3,000,000 organized workers, record our hearty appreciation of the magnificent response made to the call for volunteers to fight against the tyranny of militarism. We emphatically protest against the sinister efforts of a section of the reactionary press in formulating newspaper policies for party purposes and attempting to foist on this country conscription, which always proves a burden to the workers, and will divide the nation at a time when absolute unanimity is essential. . . . We believe that all the men necessary can, and will, be obtained through a voluntary system properly organized, and we heartily support and will give every aid to the government in their present efforts to secure the men necessary to prosecute the war to a successful issue." Something in the nature of a threat was conveyed in the words which Mr. J. H. Thomas, as the representative of the railway men, uttered in the House of Commons, September 16th—"The first day this principle (compulsory service) was introduced the government would have to deal, not with compulsory service, but perhaps unfortunately with industrial revolution." The British workmen were engaged in a fight against German militarism: they did not want militarism introduced into Great Britain. The same confident belief that the voluntary system would and must suffice was expressed by a conference, September 30th, of the Parliamentary Committee of the Trades Union Congress, the Management Committee of the General Federation of Trade Unions, the Executive of the Labor Party, and members of the Parliamentary Labor Party. It was largely as a result of this obstinate opposition to conscription expressed by labor organizations, that Lord Derby's recruiting campaign was launched in October as the last and final effort of the government to maintain the army on a voluntary basis (see below, *The Derby Recruiting Campaign*).

THE BUDGET. The third budget since the beginning of the war, and the largest in the world's history, was presented to Parliament, September 21st, by the chancellor of the exchequer, Mr. Reginald McKenna. He estimated that the army alone would cost £715,000,000 during the coming year; the navy would cost £100,000,000; advances to dominions and allies would amount to £423,000,000; food supplies, miscellaneous expenditures, and outstanding obligations would require £92,000,000; while for the ordinary ex-

penses of government only £170,000,000 was demanded. The total expenditure would be £1,590,000,000. To furnish this stupendous sum, Mr. McKenna counted upon regular taxes to the amount of £272,110,000; new taxes to the amount of £30,924,000; postal changes to bring in £1,980,000; and loans to cover £1,285,000,000. By the end of March, 1916, Great Britain's public debt would reach the staggering figure of £2,200,000,000. The new taxes which Mr. McKenna proposed may be briefly summarized: (1) a 40 per cent increase of the income tax, with a lowering of the exemption from £160 to £130, so that persons earning £2 10s. a week would have to contribute, and so that the rate on an earned income of £200 a year would be £7, 3s., 4d.; (2) an increase in the supertax on incomes over £8000, so that the possessor of an income of £100,000 would be taxed £34,000; (3) a 50 per cent tax on war-profits, which was expected to bring in £30,000,000; (4) duties increased 50 per cent on tea, tobacco, cocoa, coffee, and chicory, and 100 per cent on motor-spirit and patent medicine; (5) a new ad valorem duty of 33½ per cent on imported motor-cars, motorcycles, cinema films, clocks, watches, musical instruments, plate glass, and hats; and (6) increases in the rates for post, telegraph, and telephone. It is worth noting that item 5 marked a step towards tariff reform. It is also significant that the army was now costing £115,000,000 more than Lloyd George had estimated in the spring.

THE RESIGNATION OF SIR EDWARD CARSON. On October 18th, Sir Edward Carson announced his intention of resigning his post as attorney-general in the cabinet. Two days later he explained the reason for his resignation as his inability to concur in the Balkan policy recently enunciated by Sir Edward Grey. Not until a month later did the public learn the details of the split. At the last War Committee meeting (a small committee of the cabinet had been selected to direct the war policy) before his resignation, it seemed, the decision had been taken that it was too late to send assistance to Serbia (consult *WAR OF THE NATIONS, The Drive Through Serbia*); as he had believed it to be both possible and necessary for Great Britain then to aid Serbia, Sir Edward had tendered his resignation. Later, he sarcastically added, when M. Millerand (French war secretary) "came over here with a view to inducing the government to change this policy" of non-assistance and when General Joffre himself urged it, Mr. Asquith had decided that assistance to Serbia would even then be opportune. In reply to Sir Edward Carson's implied criticism, Mr. Asquith stated, November 18th, that assistance had been sent to Serbia without the slightest delay.

CHURCHILL'S RESIGNATION. Less than a month after Sir Edward Carson's resignation, the cabinet lost another member, Mr. Winston Spencer Churchill, who had quarreled with Lord Fisher in May, it will be recalled, and had been transferred from the important post of first lord of the admiralty in the old Liberal cabinet to the minor office of chancellor of the Duchy of Lancaster in the Coalition cabinet. Mr. Churchill's resignation was precipitated by the formation of a War Council or inner cabinet composed of Mr. Asquith, Mr. Balfour, Mr. Bonar Law, Mr. McKenna, and

Mr. Lloyd George. The premier had offered him a place in the War Council, Mr. Churchill admitted, but he had been unwilling to share in the general responsibility for the government's war policy without any personal share in its control. In a letter to Mr. Asquith dated November 11th, Mr. Churchill informed the prime minister of his resignation; in a speech before the House of Commons on November 15th he made a public and spirited defense of his conduct while in office. He had been criticized as personally responsible for (1) the destruction of Rear Admiral Craddock's fleet in the battle off Coronel, (2) the loss of the cruisers *Cressy*, *Hogue*, and *Aboukir*, (3) the disastrous failure of the expedition sent to relieve Antwerp, and (4) the Dardanelles fiasco. On all four points, Mr. Churchill's defense was vigorous and convincing. In regard to the Coronel battle, the Admiralty arrangements had been made with the full consent of naval experts, and were "probably the best that could have been made." The exposure of the three cruisers to the peril of submarines was not his mistake, and he was willing to have the Admiralty memoranda on the subject published, although "the papers might do injury to officers who are now serving and to others." (3) The Antwerp expedition had been undertaken without consulting him, and had originated with Lord Kitchener and the French government; he had taken an energetic part in perfecting arrangements for it, but could not be held responsible; moreover, the expedition could not be called an unmitigated failure, for although it had not saved Antwerp, it had the effect of "causing the great battle to be fought on the line of the Yser instead of 20 or 30 miles further south." As for the Dardanelles campaign, it had been undertaken with the approbation of naval experts, but had not received the hearty and loyal support, after it had been begun, which the first sea lord, Lord Fisher, should have given it. Had the Dardanelles expedition been properly supported, Mr. Churchill believed it might have achieved a brilliant victory and vitally affected the issue of the war. (A detailed discussion of the expedition, and of Mr. Churchill's comments upon it, will be found under the WAR OF THE NATIONS.) Mr. Churchill was succeeded by Mr. Herbert L. Samuel, November 25th.

PARLIAMENT IN DECEMBER. In December the government introduced a bill to prolong the life of Parliament 12 months beyond its normal duration, until Jan. 31, 1917. To the principle of this very important departure from constitutional practice, which involved the question of whether sovereignty rested in Parliament or the electors, little objection was raised; considerable opposition was encountered, however, because the proposed extension of the mandate of the present Parliament would make it possible for the Plural Voting Bill, which had already been passed twice by the House of Commons and twice rejected by the House of Lords (see the 1914 YEAR BOOK, p. 324), to be passed a third time by the House of Commons and enacted under the provisions of the Parliament Act. In consequence of this opposition, Mr. Asquith found it necessary to propose, as a compromise, that the prolongation of Parliament's life be made for 8 instead of for 12 months. In December Parliament was informed

that as an object lesson to the nation, the members of the cabinet had decided to reduce their own salaries. A rumor, of prime importance if true, but probably without foundation, was given great prominence in the press towards the close of the year, that Sir Edward Carson was endeavoring to form a new group in the House of Commons, to pursue a more vigorous and a more clearly defined policy in the prosecution of the war to a successful conclusion.

THE DERBY RECRUITING CAMPAIGN. The close of the year was made memorable by a great campaign for recruits, conducted under the direction of Lord Derby. The Derby campaign, begun in October and continued into the middle of December, was the final effort of the government to find a method of securing a sufficient number of recruits for the army without forcing compulsory military service upon the unwilling workingmen. With blue cards containing names copied from the National Register, soldiers and civilians made a personal canvass of the men who had not enlisted. In order that the "slackers" who refused to volunteer might be made more ignominiously conspicuous, armbands of khaki were to be given (1) to men who had enlisted and were waiting to join the colors, (2) to men who were willing but physically unfit to serve in the army, and (3) to soldiers incapacitated for further service. Each class was to be distinguished by a different type of armband. To stimulate patriotism, King George issued an appeal to the nation calling for volunteers. The men who hesitated were warned that if the voluntary system failed, compulsion would be introduced. The premier publicly announced that if the unmarried men held back, he would use compulsory methods to bring them forward, before he would ask the married men to go to the front. At the conclusion of the Derby campaign in the middle of December, before any definite announcement of the results was made, the fact was already patent that, in spite of entreaties and warnings, a very considerable number of the single men had not come forward; consequently the British press urgently and insistently called upon Mr. Asquith to make good his "pledge to the married men," by introducing a conscription bill. Later in December while the result of the Derby campaign was still a matter of speculation, Parliament was asked to authorize an increase of the maximum strength of the army from 3,000,000 to 4,000,000. Great Britain, Mr. Asquith on this occasion announced, was maintaining 1,250,000 men in the field; and since about 15 per cent of the men were lost or disabled every month, at least 2,250,000 men must be kept in reserve to maintain the field army at its actual strength during the year 1916. The army increase was voted before Parliament adjourned for the Christmas holidays, but not before the Irish Nationalists and the Laborites had found occasion to declare that they would oppose any resort to compulsory military service. As a result of the Derby campaign, official reports stated, 1,150,000 bachelors and 1,679,263 married men had presented themselves; 428,853 of these volunteers had been rejected as physically unfit, and many more would be unavailable for military service. Lord Derby estimated the net yield of his campaign at 831,062 men, including 215,431 actually enlisted and 615,631 available men "attested" for future service. Over 1,000,-

000 bachelors and a slightly larger number of married men had refused to enroll themselves; to be sure, 827,878 of these "slackers" were "starred" men, who could not be spared from industry, but 651,160 unmarried men who had not responded to Lord Derby's call, it was estimated, would be available if they could be induced to volunteer. The demand of the National Service advocates was that these 651,160 irresponsible bachelors be compelled to enlist. The question was destined to be finally decided when Parliament resumed its sittings, beginning Jan. 4, 1916. Press reports at the very close of December indicated that although the government was determined to introduce compulsory service for unmarried men, the ministry was badly divided and certain members of the cabinet, notably Sir John Simon and Mr. Arthur Henderson, had decided to offer their resignations.

SPIES AND SUSPECTS. Numerous German spies were detected in treasonable activities during the year. One of the most notorious cases was that of Anton Kuepferle, a self-confessed German soldier, who committed suicide in prison, May 20th, rather than submit to the humiliation of public execution. Two other spies, F. R. Muller and Hahn, were arrested with Kuepferle, and one of them, Muller, was executed in the Tower June 23rd. On July 15th a naval spy, Robert Rosenthal, was executed. A number of spies, whose names were not divulged, were also executed after trial by court-martial. One alleged spy, Gustav Triest, a freshman at Princeton University, was acquitted and released, November 19th. As a result of the activity of spies, and in consequence of the violent popular excitement caused by German Zeppelin raids and submarine exploits, a veritable panic of anti-German sentiment swept over the British public. Anti-German riots were of frequent occurrence until the Germans resident in England were interned in concentration camps. After the sinking of the *Lusitania* the names of the German Emperor, the Crown Prince, and other German and Austrian royalties were ordered stricken from the list of Knights of the Garter. Sir Edgar Speyer, in consequence of the accusations of disloyalty which were popularly brought against him, was constrained to resign his office of privy councillor. Sir Ernest Cassel, likewise of German birth, felt it incumbent upon himself to issue a public declaration of his unabated loyalty to Great Britain. Even Lord Haldane, who had rendered the country such conspicuous services as a statesman, was regarded with suspicion. See also INTERNATIONAL PEACE AND ARBITRATION; HARDIE, JAMES KEIR; UNITED STATES AND THE WAR; and WAR OF THE NATIONS.

GREECE. A constitutional European monarchy, situated between the Ionian and Ægean seas. It consists of 26 nomes, or departments, besides Crete and the new Turkish cession. The capital is Athens.

AREA AND POPULATION. The area previous to the Balkan wars was given at 64,657 square kilometers (24,964 square miles), with a population in 1907 of 2,631,952. The area, population (1907), and density of the 26 nomes, and also of Crete, together with figures of the new Turkish cession are given in the following table:

	Sq. km.	Pop.	Pop. per sq. km.
Acarnania and Ætolia....	5,225	141,405	27
Achaia	3,136	150,918	48
Arcadia	4,357	162,324	37
Argolis	2,585	81,948	32
Arta	1,888	41,280	30
Attica	3,127	341,247	108
Bœotia	3,117	65,816	21
Cephalonia	763	71,235	93
Corfu	681	99,571	146
Corinthia	2,370	71,229	30
Cyclades	2,719	130,878	48
Elis	2,014	103,800	51
Eubœa	3,895	116,903	30
Eurytania	2,322	47,192	20

Turkish cession, including Crete	55,400	2,066,647	37
	120,057 †	4,698,599	39

† 46,345 square miles.

Besides Crete, with an area of 8618 square kilometers, the area acquired from Turkey includes the insular districts of Lesbos, Samos, and Chios, the estimated area of which is 4018 square kilometers, and, on the mainland, the districts of Salonica, Kozani, Florina, Serres, Drama, Janina, and Prevesa, aggregating about 42,760 square kilometers. The principal towns with their 1907 population, follow: Athens, 167,479; Piræus, 71,506; Patras, 37,724; Corfu, 27,397; Volo, 23,563; Larissa, 18,041; Trikkala, 17,809; Hermoupolis, 17,773; Pyrgos, 13,690; Zante, 13,580; Kalamata, 13,123; Chalcis, 10,958; Tripolitza, 10,789; Laurion, 10,007. Approximate population of the principal towns in the territory ceded by Turkey: Salonica, 158,000; Candia, or Iraklion (Crete), 25,000; Canea (Crete), 24,200; Kavala, 23,400; Serres, 18,700; Janina, 16,800; Drama, 12,900.

INDUSTRIES. Agriculture is the principal industry, though the methods are antiquated; the chief crops are currants, grapes, cereals, tobacco, citrus fruits, olives, and figs. The area of old Greece under cultivation is given at about 5,563,000 acres—1,112,000 under cereals, 1,200,000 fallow, 2,025,400 under forests. There are in addition 5,000,000 acres under pasture. The principal crop is currants, with an annual average yield of 150,000 tons, which far exceeds the export; the surplus is utilized in the manufacture of denatured alcohol. The law limiting the output has resulted in the uprooting of many large plantations. The cereals grown are wheat, barley, rye, corn, and maslin. The output of currants in 1913 was 160,000 tons; olives, 50,000,000 oke (1 oke equals 2.85 pounds); wheat, 12,593 bushels; tobacco (1912), 86,355 hundredweights, and in the new territories 274,000 hundredweights; figs (1912), 240,000 hundredweights; grapes (1912), 140,551,000 oke. Currant crop (1910-11), 262,500,000 pounds, of which 225,130,412 pounds were exported.

Live stock, as reported for 1914: horses, 149,000; mules, 79,500; asses, 132,800; cattle, 300,-

000; sheep, 3,546,600; goats, 2,638,000; swine, 227,200. Sericulture is carried on.

The output of the principal minerals produced is reported as follows for 1912 and 1913 respectively: iron, 431,632 and 423,569 tons; manganese iron, 14,311 and 21,477; iron pyrites, 29,767 and 26,285; lead, 27,347 and 24,918; nickel, 15,111 and 16,416; zinc, 30,570 and 25,862; magnesite, 62,995 and 52,502; chromite, 6310 and 6930; emery, 8268 and 5649. Some of these outputs are considerably below the amounts produced before the Balkan wars. Mining concessions cover a total of about 20,000 acres.

COMMERCE. Import and export values are stated as follows, in thousands of drachmas (the par value of the drachma is 19.295 cents):

	1909	1910	1911	1912	1913
Imports	137,549	160,586	178,510	157,657	177,938
Exports	101,687	144,571	140,908	146,163	119,001

The principal imports are grains, yarn and textile fabrics, coal, timber, chemicals and drugs, minerals and metal wares, sugar, fish, and coffee. The exports for 1910 of the principal products are given below in drachmas, with the share of the United Kingdom, France, Germany, and the United States in thousands of drachmas; a few only of the articles are given, and totals for each country named:

Exports	U. K.	Fr.	Ger.	U. S.	Total
Currants	22,497	1,064	5,189	4,876	40,528,474
Wine, etc.	1,525	6,154	3,109	289	18,638,504
Olive oil	816	2,667	62	693	17,465,554
Tobacco leaf	90	74	1,595	180	12,051,045
Figs	54	16	822	221	5,887,184
Arg. Lead	1,292	2,639			10,110,240
Zinc	203	258	642		5,144,776
Hematite	2,828		513	176	4,296,150
Other					
Total	33,084	15,468	15,097	10,540	144,571,070

As will be seen, Great Britain is the leading country of origin and destination. In the 1911 trade, she contributed imports valued at 40,580,000 drachmas, and received exports to the amount of 33,777,000 drachmas; Russia, 34,449,000 and 2,601,000; Austria-Hungary, 23,721,000 and 13,520,000; Bulgaria, 14,146,000 and 360,000; Germany, 13,336,000 and 16,364,000; France, 10,438,000 and 13,733,000. In 1913 the export of currants was valued at 40,663,000 drachmas; tobacco, 19,616,000; olive oil, 15,317,000; wine, 12,510,000. The trade of Crete for 1911 was valued at 21,359,000 drachmas imports and 15,631,000 exports.

COMMUNICATIONS. Railways (1912), 1609 kilometers. Previous to the outbreak of the Balkan War in 1912, lines from Leontari to Gythion (70 miles) and from Olympia to near Leontari (23 miles) were under construction. The Gravia to Volo line to the Gulf of Corinth was also under way. In 1915 the railway system of Greece in its extent of line open to traffic, included about 950 miles in the so-called "Old Kingdom," or territory occupied by Greece before the conclusion of the second Balkan war, while the new provinces contributed a further 1720 miles. Notwithstanding the hostile conditions, an extensive programme of new lines was drawn up in the early part of the year to develop the country which the Turks had left entirely without railway facilities, especially in Epirus and Crete, and to a less extent in Mace-

donia, where only a few main lines absolutely necessary had been built. The scheme of construction proposed was two lines with a length of 60 miles for Crete, while five lines were to be built in Macedonia, with a total length of 320 miles, the most important of which was the Calambaka-Sarowitz line, 100 miles in length. This last not only was to run through a country entirely devoid of modern transportation facilities, but possessed great strategical importance, as it would enable troops to be concentrated on the northern frontiers. During 1915 20 heavy (2-8-2) locomotives were built by the American Locomotive Company in the United States for the Greek government railways. For other data concerning railroads, and for mileage of telegraph lines, etc., see 1914 YEAR BOOK.

FINANCE. The total revenue for the year 1911 amounted to 136,277,463 drachmas, and the expenditure to 135,094,473. The budget for 1912 estimated the revenue at 144,118,645 drachmas and the expenditure at 143,326,520. Estimated revenue for 1913, 201,162,000 drachmas; expenditure, 253,957,000. The gold debt amounted, Dec. 31, 1912, to 833,581,000 and the paper to 150,009,565 drachmas.

NAVY. The fleet included (July, 1913) 4 ironclads, 1 modern cruiser, 14 destroyers, 4 corvettes, 13 torpedo boats, 2 submarines, and miscellaneous minor craft. The *Salamis*,

launched 1914, has a displacement of 10,500 tons; its principal armament is eight 14-inch guns and 12 6-inch guns; torpedo tubes, 5; horsepower, 40,000; maximum speed, 23 knots. In the summer of 1914 the Greek navy was strengthened by the battleships *Mississippi* and *Idaho*, purchased from the United States, and renamed *Lemnos* and *Kilkis*. These are sister ships, laid down by the Cramps (Philadelphia), May 12, 1904, and commissioned, one Feb. 1, and the other April 1, 1908. The *Mississippi* was built at a total cost of \$5,832,801, and the *Idaho* \$5,892,821. Their displacement is 13,000 tons; mean draft, 24 feet 8 inches; speed, 17 knots; main armament, 4 12-inch and 8 7-inch guns.

GOVERNMENT. The executive authority is vested in the King, who is assisted by a responsible ministry. The legislative body consists of a single Chamber of 316 members, elected by manhood suffrage. The reigning King, Constantine I, succeeded to the throne upon the assassination (March 18, 1913) of his father, George I, son of Christian IX of Denmark, who was elected King by the Greek National Assembly in 1863. Heir-apparent, Prince George, born July 19, 1890. Constantine married, Oct. 27, 1889, Sophia, Princess of Prussia, sister to the German Kaiser.

HISTORY

THE QUESTION OF GREEK NEUTRALITY. The vexed question whether Greece should intervene

in the great European war completely overshadowed all other issues in Greek politics during the year 1915. The successive cabinet crises through which Greece passed, and the information subsequently divulged by M. Venizelos, made it patent that the indecision of the Greek government was in large part due to the fact that while on one hand the party of M. Venizelos, which controlled the majority of the Greek Parliament, was ardently in favor of the Entente and eager to enter the war in the hope of acquiring territory, the King, on the other hand, with the support of the German-trained army officers, and with the approval of a considerable element of the people, was stubbornly determined not to join forces with the Entente. King Constantine's refusal to intervene in the war was perhaps partly ascribable to the influence of his wife, Queen Sophia, a sister of the German Emperor; doubtless also the admiration for German military methods to which he had frequently given outspoken expression before the war (for example, consult the YEAR BOOK for 1913, p. 292) now made him extremely reluctant to hazard his own army in a struggle against the Central Powers, especially since the Entente armies had given no convincing proof as yet of their ability to win the war.

THE FIRST RESIGNATION OF PREMIER VENIZELOS. The conflict between the policy of the King and the policy of the cabinet was clearly revealed by the resignation of M. Venizelos in March, 1915. Up to that time, although negotiations for a new Balkan alliance had been rumored, comparatively little information had been vouchsafed the public in respect of the secret negotiations by which the Entente Powers were endeavoring to enlist the active coöperation of Greece against Turkey. The most important statements of policy by M. Venizelos, as head of the Greek government, had been declarations of neutrality. When the Austro-Hungarian armies invading Serbia had taken Belgrade, and the Entente Powers had inquired whether Greece considered herself bound to aid Serbia under the terms of the Serbo-Greek treaty of 1913, Venizelos had affirmed the decision of the Greek government to remain neutral. Just before the Christmas holidays (Old Style), when during the course of the budget debates an Opposition leader, M. Theotokis, had pointed to the recent loan advance of 20,000,000 francs accepted from France as a violation of Greek neutrality, M. Venizelos had again declared that the neutrality of Greece was inviolate. The Anglo-French attack on the Dardanelles forced Greece to reconsider her neutrality. As it afterwards appeared, the Triple Entente was willing to pay a high price for Greek participation in the campaign, and Premier Venizelos of Greece was quite willing to make the bargain. Rumors of an impending decision aroused the liveliest excitement in Greece during the first week of March. Four former premiers of Greece, Theotokis, Ralli, Mavromichalis, and Dragoumis, were called to the palace to consult with the King and the prime minister in a formal Crown Council. Unable to obtain the approval of the King for his policy of intervention, M. Venizelos handed in the resignation of his cabinet, March 6th. M. Zaimis, former Cretan high commissioner, who was recommended by Venizelos as the best man to head a new cabinet, declined to accept the responsibility. Then the King turned

to M. Gounaris, who had been minister of finance in the Theotokis cabinet of 1908. M. Gounaris succeeded in forming a cabinet, March 9th, in which the portfolios were distributed as follows: Premier and minister of war, Gounaris; foreign minister, Christakis Zographos; communications, Baltadjis; instruction, Vozikis; finance, Protopapadakis; interior, Triantafyllakos; national economy, Eutaxias; justice, Isaldaris; marine, Stratas. The declaration of policy issued by the new cabinet, March 10th, contained the significant statement that Greece should "seek the satisfaction of her interests" without "compromising the integrity of her territory." The government officially implied that the outgoing premier had been willing to surrender a portion of Greek territory to Bulgaria, the most bitter foe and rival of Greece. Indignant, and anxious to justify himself before the country, M. Venizelos now made interesting revelations. In an interview with the *Corriere della Sera* March 16th, he admitted that when the Anglo-French operations at the Dardanelles were first undertaken, he had advocated sending Greek troops to aid the Allies, in response to the informal invitation of the Entente Powers. In return, he hoped to gain the vilayet of Smyrna for Greece. This proposal, he asserted, the Crown Council had been too faint-hearted to accept, since it feared that Greece would be exposed to invasion by land. On March 31st M. Venizelos addressed a letter to the foreign minister (M. Zographos); asking the government to deny that the Venizelos cabinet had planned to alienate a portion of Greek territory. Instead of the desired *démenti*, the King sent a letter to M. Venizelos, maintaining that he, M. Venizelos, had, as a matter of fact, proposed the cession of Sari Shaban, Drama, and Kavala in order to bribe Bulgaria to join the Entente Powers in conjunction with Greece. This allegation Venizelos indignantly denied; he had only proposed certain frontier rectifications to be effected only after the conclusion of the war, when Greece would obtain ample compensation—about 140,000 square kilometers in Asia Minor. To substantiate his statements, M. Venizelos published a memorandum which he had submitted to King Constantine on January 24th, communicating the British offer of territory in Asia Minor in return for Greek aid. Greece was asked also to withdraw any objections which she might have to the cession of part of Serbian Macedonia by Serbia to Bulgaria. In his memorandum, M. Venizelos argued that Greece might as a last resort give up Kavala in order to obtain the very desirable ends in view—Smyrna, reconciliation with Bulgaria, and the aid of Bulgaria and Rumania in creating a Greater Greece and in warding off the Austro-German peril. The King, however, had refused to regard the Bulgarian question seriously, and had instructed Venizelos to enter into negotiations with Rumania, disregarding Bulgaria. A second memorandum, which had been submitted to the King on January 30th, was published by M. Venizelos, April 4th. In this document M. Venizelos set forth the contention that inasmuch as Rumania was reluctant to join with Greece and Serbia unless Bulgaria were included in the new Balkan alliance, it would be criminally short-sighted on the part of the Greek government to balk at the cession of Drama, Kavala, and Sari Shaban—only 2000 square kilometers

 Prime Minister of Bulgaria

FOUR BALKAN STATESMEN PROMINENT IN 1915

in all, inhabited by 30,000 Greeks—when it was possible thereby to gain the friendly coöperation of Bulgaria and Rumania in securing for Greece in Asia Minor over 100,000 square kilometers of territory with a Greek population of about 800,000. According to M. Venizelos's statement, King Constantine withdrew his objections to the cession of Kavala and authorized negotiations with Bulgaria on the lines indicated in the second memorandum. But the announcement that Bulgaria had accepted a loan from German bankers, supervening just at this juncture, upset all the plans of Greece, and convinced M. Venizelos that it would be impossible to gain the coöperation of Bulgaria against the Central Powers and Turkey, even by the offer of territorial concessions. The offer was therefore not made. M. Venizelos further admitted that the Allies had asked Greece to assist Serbia alone, and that Greece had refused, for the reason that the Allies were unwilling to send more than two divisions of infantry to protect Greece against a possible Bulgarian attack. As a counterblast to the ex-premier's revelations, King Constantine issued a *communiqué*, April 6th, flatly denying that he had ever authorized Venizelos to negotiate any agreement which would involve the alienation of Greek territory. The controversy now narrowed itself down to a clear-cut question of fact. M. Venizelos, regarding the royal statement as an impeachment of his own veracity, showed his resentment by absenting himself from the *Te Deum* service, April 7th, when the court celebrated the national holiday of Greece. Venizelos furthermore addressed a letter to the King, threatening to retire from political life entirely, unless the *communiqué* were corrected. The denial was not made, however, nor was the threat fulfilled.

THE RETURN OF VENIZELOS TO POWER. Parliamentary elections were held in June. The government platform promised a long list of important measures, among which may be mentioned: proportional representation, decentralization of public authority, greater economy in public finance, tariff revision, the increase of direct and the reduction of indirect taxation, amelioration of labor conditions, and encouragement of peasant-proprietorship. In respect of foreign policy, the government promised to make no territorial concessions, but to watch for every opportunity to increase the greatness of Greece. In spite of this strong bid for popular support on the part of the Gounaris cabinet, the victory of the Venizelist party was practically a foregone conclusion. Almost 200, out of the total of 316 deputies elected to constitute the new Parliament, were supporters of M. Venizelos. The minister of finance in the Gounaris cabinet having lost his seat in the Chamber of Deputies, resigned his portfolio in the ministry, June 15th. The premier himself delayed his resignation only until the meeting of the newly elected Parliament, which took place August 16th. A fortnight before his resignation, M. Gounaris received a visit from the British, French, Italian, and Russian ministers at Athens, presumably to urge upon Greece the necessity for making concessions to Bulgaria. A few days later M. Gounaris publicly reaffirmed his determination not to cede a single inch to Bulgaria. When M. Gounaris resigned, August 16th, the question arose whether King Constantine would consent to reinstate M. Veni-

zelos as premier, disregarding the recent quarrel. An agreement was reached between the King and the politician, August 22nd, on the basis of (1) benevolent neutrality towards the Entente Powers; (2) fulfillment of treaty obligations toward Serbia; (3) no cession of Greek territory. As a result of this understanding, M. Venizelos was able to resume his post as premier and minister of foreign affairs, August 23rd. His colleagues were as follows: Minister of war, General Danglis; marine, Miaoulis; finance, Repoulis; interior, Gafayris; justice, Raktavin; communications, Diamantidis; public instruction, Tsirimokos; national economy, Michalakopoulos.

THE SECOND RESIGNATION OF VENIZELOS. A new crisis arose in the latter part of September when Bulgaria mobilized against Serbia (see *BULGARIA, History*) and the Greek government was confronted by two problems; first, whether Greece should fulfill her treaty obligations by aiding Serbia against Bulgaria; second, whether Greece should allow Anglo-French troops to pass through Greek territory on their way to fight with the Serbians. On these two points the King and the premier were absolutely disagreed. According to M. Venizelos's own statement (*Corriere della Sera*, November 23rd), the Greek premier acted upon the belief that by persisting in neutrality Greece would not avert, but simply postpone, war with Bulgaria; hence the course of wisdom would be to fight Bulgaria in alliance with Serbia and with the aid of Anglo-French troops. Accordingly, in the latter part of September, M. Venizelos not only ordered Greek mobilization, September 25th, but furthermore asked France and England if they were willing to send 150,000 troops to the support of Serbia. The King, however, refused to consider any such proposition. Venizelos communicated the King's refusal to the Entente Powers. In reply, he received a note from the French minister, October 2nd, announcing that the first contingent of French troops had already arrived at Saloniki, and that other French and English troops would be sent through Greek territory to aid Serbia. "As the *casus foederis* justifying Greek intervention in favor of Serbia had not yet occurred" (as Bulgaria had not yet attacked Serbia), said M. Venizelos, "I protested against the landing of the Anglo-French troops at Saloniki because Greece was still neutral. I could not but be glad however, because I was certain that Bulgaria was on the point of attacking Serbia. . . . On October 5th, however, I was compelled to resign, as the King disapproved what I had done." The text of the Greek protest against the Anglo-French landing at Saloniki was as follows: "In answer to your letter, I have the honor to declare to Your Excellency that, being neutral in the European war, the Royal government (of Greece) could not possibly sanction the proceeding in question, for it constitutes a breach of Greece's neutrality, the more manifest since it comes from two great belligerent Powers. It is therefore the duty of the Royal government to protest against the passage of foreign troops across Greek territory."

THE ZAIMIS CABINET AND THE CYPRUS OFFER. Following the resignation of M. Venizelos, which occurred October 5th, Alexander Zaimis accepted the post of premier and formed a cabinet, October 7th, in which the portfolios were distributed as follows: Foreign affairs, Zaimis; interior,

Gounaris; war, Yanakitsas; marine, Countouriotis; finance, Dragoumis; public instruction, Theotokis; justice and communications, Rhallis. The Zaimis cabinet lasted less than a month, but during its short term of office it decided two important questions. In the first place, when Bulgaria attacked Serbia, October 14th, M. Zaimis refused to involve Greece in the war, and announced that in view of changed circumstances, the Serbo-Greek treaty did not now bind Greece to aid Serbia against Bulgaria. In the second place, the Zaimis government had to consider an offer made by Great Britain, October 17th, whereby in return for active Greek military support, Greece would obtain the important Island of Cyprus from Great Britain. Greece rejected the offer. The Zaimis government never commanded the majority of the Greek Parliament, but existed merely at the will of the King and at the sufferance of M. Venizelos. A violent debate, following a speech which the minister of war chose to regard as a personal insult, led to a vote of no confidence (147-114) and to the resignation of M. Zaimis, November 4th.

THE SKOULLOUDIS CABINET. M. Zaimis was succeeded by a former foreign minister of Greece, M. Skouloudis, who had played a conspicuous part in the London Conference of 1913. The cabinet formed by M. Skouloudis, November 7th, was almost identical with that of his predecessor: Foreign affairs and premier, Skouloudis; public instruction, Micheledkis; justice and communications, Rhallis; interior, Gounaris; national economy, Theotokis; war, Yanakitsas; marine, Countouriotis; finance, Dragoumis. With the Skouloudis cabinet the question was no longer whether Greece should help Serbia—that question had been settled in the negative. The question now was whether the Anglo-French expeditionary forces, and the defeated Serbian armies, should be allowed to operate freely upon Greek territory, instead of being interned, as a strict interpretation of Greek neutrality might require. The whole question is treated in the article **WAR OF THE NATIONS** (q.v.). In this place, it is necessary only to point out that inasmuch as Venizelos still commanded a majority in the Greek Parliament, it was necessary for the King to dissolve Parliament November 11th, in order to forestall a conflict between the ministry and the majority. New elections were called for December 19th. Against this step the Venizelists most strenuously protested. The King was violating the constitution, they claimed, in refusing to recognize the results of the June elections, which had expressed the country's approbation of M. Venizelos and his policies. M. Venizelos therefore announced that he would regard the December elections as unconstitutional, and urged his followers to take no part in the balloting. The result, as might easily have been foreseen, was the return of a majority pledged to support the government. In his political duel with M. Venizelos—for in that way the events of the year may be epitomized—King Constantine had triumphed. Greece had not joined the Entente.

GREENE, EDWARD LEE. An American botanist and educator, died Nov. 10, 1915. He was born in Hopkinton, R. I., in 1843, and graduated from Albion College in 1866. He was an Episcopal clergyman in 1871-85, and then became a Roman Catholic layman. He was professor of

botany at the University of California from 1885 to 1895, and at the Catholic University of America from 1895-1904. In the latter year he was associate in botany at the Smithsonian Institution. His writings include: *Manual of Botany for the Region of San Francisco Bay* (1894), *West American Oaks* (1887), *Pittonia* (5 vols. 1887-1903), *Landmarks of Botanical History* (1909).

GREENLAND. A Danish Arctic colony. Estimated area, 2,200,000 square kilometers (849,420 square miles). Area of settlements (colony proper) 88,100 square kilometers (34,015 square miles). Population of colony proper in 1901, 11,893 (11,621 Eskimos and 272 Europeans); Feb. 1, 1911, 13,459 (13,075 Eskimos and 384 Europeans). In 1912 births and deaths among the Eskimos were 482 and 389 respectively; in 1913, 566 and 377. Trade is restricted to Denmark. Imports from Denmark in 1912 and 1913 were valued at 482,873 and 608,875 kroner respectively; exports to Denmark, 899,451 and 965,802. Principal exports: seal and fish oil, valued in 1912 and 1913 at 490,000 and 467,900 kroner; seal skins, 81,800 and 90,500; blue fox skins, 121,350 and 161,300. The director resides at Copenhagen.

GREGORY, DANIEL SEELYE. An American clergyman and editor, died April 14, 1915. He was born in Carmel, N. Y., in 1832, and graduated from the State Normal College at Albany in 1850 and from Princeton Theological Seminary in 1860. In the following year he was ordained to the Presbyterian ministry, and from then till 1871 served various pastorates. From 1871 to 1878 he was professor of metaphysics, logic, and English literature at the University of Wooster, and was president of Lake Forest University from 1878-86. From 1890-94 he was managing editor of the *Standard Dictionary*. He edited the *Homiletic Review* from 1895-1904, and from that year until his death was general secretary of the Bible League of North America, and managing editor of the *Bible Student and Teacher*. His writings include *Christian Ethics* (1875), *The Crime of Christendom* (1900), and *Constructive Studies in John, the Gospel for the Christian* (1909).

GREGORY, ELIOT. An American artist and writer, died June 1, 1915. He was born in 1854 in New York City and graduated from Yale in 1880. For several years he studied art in Paris, and one of his paintings received honorable mention at the Salon. On his return to New York City he established one of the first studios on the European model. This became a meeting place for artists, musicians, and persons prominent in social life in the city. Mr. Gregory also wrote on a variety of subjects. For many years his *Idler Papers* appeared in the New York *Evening Post*. A number of his essays were gathered into two volumes, *Worldly Ways and By-Ways* and *The Ways of Men*. He was regarded as an authority on art and literary subjects. His work as an artist consisted mostly of portraiture. His portrait of Ada Rehan as "Katherine" in *The Taming of the Shrew*, painted for Augustin Daly, is now in the Shakespeare House in Stratford-on-Avon.

GRENADA. A British West Indian colony, consisting of the Island of Grenada, which is the most southerly of the Windward Islands group, and some of the Grenadines. The area of the island is about 119 square miles; the Grena-

dines have an area of about 14 square miles (Carriacou, the largest, 8467 acres); so that the area of the colony is stated at 133 square miles. At the 1911 census, the population of the colony was 66,750 (6886 in Carriacou); estimate of Dec. 31, 1913, 69,307. The capital and chief town is St. George's (population, 1911, 4916); it has an excellent harbor. About 2 per cent of the inhabitants of the colony are Europeans, almost all the rest being negro. In 1913, there were 30,200 acres under cultivation. Sugar culture is declining, and the cacao is the crop of chief commercial importance. Imports and exports in 1913-14 were valued at £282,927 and £367,149 respectively. Revenue in that year amounted to £91,258 (of which £53,900 from customs); expenditure, £85,827. Public debt, £123,670.

GRENADINES. See GRENADA; and SAINT VINCENT.

GREY, SIR EDWARD. See UNITED STATES AND THE WAR.

GEOTON, WILLIAM MANSFIELD. An American theologian and educator, died May 25, 1915. He was born in Waldoboro, Me., in 1850, and graduated from Harvard University in 1873. He studied theology in the Philadelphia Divinity School, graduating in 1876. In the following year he was ordained a priest of the Protestant Episcopal Church. He was rector of several churches in Canada, Massachusetts, and Rhode Island until 1898, when he became professor of systematic theology in the Divinity School of the Protestant Episcopal Church, in Philadelphia. From 1900 until his death he was dean of that school. He was a member of many important committees at general conventions of his church. In 1912 he was lecturer at Philadelphia on the Bohlen Foundation. He was the editor of the *Sunday School Teacher's Manual* (1909).

GUADELOUPE. A French colony composed of the islands of the Lesser Antilles. Area, 1780 kilometers (687 square miles); population (1911), 212,430. The capital is Basse-Terre. In 1912, imports and exports were valued at 19,524,116 and 26,084,302 francs respectively; in 1913 imports came to 20,174,930 francs (of which 11,196,908 francs represents imports from France) and exports amounted to 18,287,489 francs (of which 16,401,932 francs represents exports to France). The leading exports are cacao, coffee, and sugar.

GUATEMALA. The most northwesterly of the Central American republics. The capital is Guatemala City.

AREA, POPULATION, ETC. The Guatemalan-Honduran boundary has not been entirely fixed, but in the spring of 1915 a treaty was concluded between the two governments looking toward a settlement of the long-standing boundary dispute. On account of the unsettled boundary, the area of Guatemala has been variously stated; one estimate is 48,290 square miles, and another 43,641 square miles. The population, as calculated for the end of 1913, was 2,119,165, as compared with 1,842,134, the figure returned by the census of Dec. 31, 1903. The 1903 census showed about 60 per cent of the population Indian and most of the remainder mestizo. Varying estimates are made for urban populations. Guatemala City, with suburbs, is supposed to have upwards of 100,000 inhabitants; Quezaltenango, 34,000; Cobán, 31,-

000; Totonicapán, 29,000; Esquintla, Zacapa, Chiquimula, and Jalapa, about 18,000 each; Santa Cruz del Quiché, 17,000; Jutiapa, 16,000; Antigua, Salamá, and Huehuetenango, about 15,000 each; Amatitlán, 12,000; Solola, 11,000. The number of births reported for 1913 and 1914 respectively was 75,593 and 76,551; deaths, 38,320 and 40,878; excess of births, 37,273 and 35,673; marriages, 5274 and 5873.

The reported number of public primary schools in 1912 was 1837, with 59,631 pupils; in 1913 pupils numbered 61,136; in 1914, there were 1878 public primary schools, with 64,387 pupils. At the normal schools 343 male and 370 female students were enrolled in 1914. There are a few secondary schools, a medical school, a law school, and several other educational institutions. Roman Catholicism is the prevailing religion. There is no state church.

PRODUCTION AND COMMERCE. Guatemala is a fertile country and produces crops of corn, sugar cane, bananas, cacao, tobacco, etc. Commercially the most important product is coffee. Estimated yield for 1914 is reported as follows in quintals: coffee, 918,522; corn, 4,611,292; wheat, 546,532; rice, 237,523; potatoes, 308,733; beans, 184,426; brown sugar, 100,000. The banana yield was estimated at 7,933,487 bunches. Grazing is of considerable importance; cattle in 1914, 1,407,223. There are valuable forests, in which are worked rubber, chicle, dye woods, cedar and mahogany. Some gold placers are worked, but mining, as well as manufacturing, is little developed.

Imports and exports have been valued as follows:

	1911	1912	1913	1914
Imp.	\$8,166,670	\$9,822,462	\$10,062,828	\$9,831,115
Exp.	\$11,005,835	\$13,156,538	\$14,449,926	\$12,754,027

To the actual invoice value of imports at the maritime customs houses, the Guatemalan authorities add 25 per cent—an estimate covering freights, insurance, commissions, etc. This addition is included in the above import values. In 1912 and 1913 respectively, the principal exports were as follows, values expressed in thousands of dollars: coffee clean, 9126 and 9905; coffee in parchment, 1863 and 2350; bananas, 667 and 826; cattle hides, 190 and 455; sugar, 565 and 349; woods, 241 and 248. The principal countries that have shared in the trade are as follows, in thousands of dollars:

	Imports		Exports	
	1912	1914	1912	1914
United States	5,053	4,879	8,928	4,874
Germany	2,048	1,848	7,654	5,413
United Kingdom	1,650	1,890	1,600	1,477
France	402	818	21	34

COMMUNICATIONS. The reported length of railway in operation in 1914 was 502 miles. San José and Champerico, on the Pacific, have rail connection with Guatemala City, and the latter with Puerto Barrios, on the eastern coast. Connection was made with the Mexican railway system in 1914. Telegraph lines, over 4200 miles; telegraph offices, 236; post offices, about 380.

FINANCE. Revenue and expenditure for the fiscal year 1914 are reported at 82,399,925 and 48,735,805 pesos (paper) respectively. The paper peso fluctuates in value, but is commonly regarded as being worth about six cents. Of

the revenue in 1914, 63,366,454 pesos were derived from customs. Estimated expenditure for the fiscal year 1915, 50,620,617 pesos; for 1916, 60,082,637. The largest disbursement is on account of the public debt, 24,811,744 as estimated for the fiscal year 1916; war, 9,629,826; interior and justice, 6,736,499; public instruction, 6,443,538; public works, 5,305,391; foreign debt, with arrears of interest, £2,357,063.

GOVERNMENT. The legislative power is vested in the National Assembly of 69 members, elected by direct vote for four years, and in the Council of State of 13 members, in part elected by the Assembly and in part appointed by the President. The latter is elected by a direct vote for six years and is assisted by a cabinet of six members. The President in 1915 was Manuel Estrada Cabrera (born 1857), who succeeded to the executive office in March, 1898, and subsequently was elected for terms ending March 15, 1905, 1911, and 1917. There is a first designate and a second designate to act as president in case of the latter's death or disability. On May 11, 1915, the National Assembly elected Ignacio López Andrade as first designate, and Gen. Manuel Duarte as second designate.

HISTORY. In May the National Assembly elected Ignacio López Andrade first Vice-President of the republic and Gen. Manuel Duarte second Vice-President. Presidential elections were to be instituted Jan. 10, 1916. The budget for the fiscal year from July 1, 1915, to June 30, 1916, contemplated a total expenditure of 60,082,640 pesos currency, or \$3,604,958.40. In July a boundary convention was concluded between Guatemala and Honduras. As her delegates to the commission to delimit the boundary, in accordance with the July convention, Guatemala appointed Claudio Urrutia, Felipe Rodriguez, Domingo Conde, Florencio Santizo, Salvador Castillo, and Eugenio Rosal. Marcial Pren was nominated legal adviser to the commission. By the terms of the convention, if the commission should fail to reach a satisfactory settlement, the boundary dispute between the two countries was to be arbitrated by the President of the United States. Early in September a violent earthquake, which was experienced also in several South American countries, caused serious damage to Jutiapa, the capital city of Jutiapa district in Guatemala. An insurrection in the region of San Marco in October failed to achieve more than a local significance. See also **INTERNATIONAL PEACE AND ARBITRATION.**

GUIANA. See **BRITISH GUIANA**; **DUTCH GUIANA**; **FRENCH GUIANA.**

GUILD, CURTIS, JR. An American editor and diplomat, died April 6, 1915. He was born in Boston in 1860. He was educated at Harvard University, where he graduated with the highest honors in 1881. In 1884, after traveling in Europe, he joined the staff of the Boston *Commercial Bulletin*, the property of his father. In 1902 he took entire charge of the paper, which he continued until his death. He began his political career at the age of 21. In 1895 he was elected president of the Republican State Convention and in the following year was prominent as a campaign speaker. He also took an active part in the campaign of 1900 and in 1901 was elected Lieutenant-Governor of Massachusetts. He was elected Governor in 1905 and was reelected for two successive terms. In 1911 he was appointed United States Ambassador to

Russia, serving until 1913. He served with distinction in the Spanish-American War. He contributed occasional articles to magazines and was a member of many patriotic societies.

GULFLIGHT CASE. See **UNITED STATES AND THE WAR.**

GUTHE, KARL EUGEN. An American educator and physicist, died Sep. 11, 1915. He was born in Hanover, Germany, in 1866, and was educated in the universities of Marburg, Strassburg, and Berlin. In 1892 he removed to the United States, and as instructor and assistant professor taught physics at the University of Michigan until 1903. In 1903-05 he was associate physicist in the United States Bureau of Standards, and in 1905-09 professor of physics at the State University of Iowa. In 1909 he became professor of physics at the University of Michigan. From 1912 he was also dean of the graduate department of the university. He was the author of *Manual of Physical Measurements* with J. O. Reed, 1902; *Text Book of Physics* (1908); *College Physics* (with J. O. Reed, 1911); and *Definitions in Physics* (1913). He contributed many papers on physics, particularly on electricity, to different scientific journals. He was a member of many American and foreign scientific societies.

GYMNASTICS. The seventeenth annual intercollegiate gymnastics championships were won by Yale with a score of 22 points. Princeton finished second with 17 points and Pennsylvania third with 9 points. Other scores were: Amherst 7; New York University 5; Columbia 1; Harvard 1; Rutgers 1.

Dual college meets resulted as follows: Yale 35, Princeton 19; Yale 45, Rutgers 9; Yale 35, Pennsylvania 19; United States Naval Academy 41, New York University 10; United States Naval Academy 34, Yale 24; United States Naval Academy 32, Columbia 22; Princeton 33½, Rutgers 14½; Harvard 35, Brown 19; Harvard 42, Dartmouth 12; Pennsylvania 29, New York University 25; Columbia 31, New York University 23; Rutgers 28, Columbia 26; New York University 33, Amherst 21; New York University 33, Rutgers 21.

The club championships of the Amateur Athletic Union held at San Francisco resulted as follows: Rope climb, R. Illing, Olympic Club; tumbling, J. F. Dunn, New York A. C.; club swinging, R. W. Dutcher, New York A. C.; horizontal bar, Franz Kanis, Newark Turn Verein; side horse, J. Oeassy, West Side Y. M. C. A., New York; parallel bars, P. Hol, Norwegian T. and A. C.; flying rings, Otto Paul, National Turn Verein; all-around, Franz Kanis, Newark Turn Verein.

The club point scores follow: Newark Turn Verein 21; Norwegian T. and A. C. 21; New York A. C. 11; Swiss Turn Verein 9; New York Turn Verein 8; West Side Y. M. C. A. 7; National A. C. 5; Grace Club 5; National Turn Verein 3; Rutgers College 2; Harlem Y. M. C. A. 2; Bohemian-American W. G. A. 2; Bohemian Gymnasium Association 1; Ninety-second Street Y. M. H. A. 1.

HAIG, SIR DOUGLAS (1861-). A British soldier. He entered the army in 1885 as a member

of the 7th Hussars. In 1898 he served in the Sudan and was made brevet-major for services in the Atbara and Khartum campaigns. In South Africa he was deputy assistant adjutant-general of cavalry in Natal. In 1900 he became assistant adjutant-general of the cavalry division. He was lieutenant-colonel commander of the 17th Lancers 1901-03; inspector-general of cavalry in India, 1903-06; major-general 1904; director of military training 1906-7; director of staff duties at headquarters 1907-09; chief of staff in India, 1909-12; and general officer commanding at Aldershot 1912-14. When the great war broke out in 1914 he was made lieutenant-colonel of the 1st army corps which went with the British expeditionary force to France. In December he succeeded Sir John French (q.v.) in command of the entire British forces in France. See WAR OF THE NATIONS.

HAÏTI. A republic occupying the western, and smaller, part of the West Indian island of Haiti. Capital, Port-au-Prince.

AREA, POPULATION, ETC. The estimated area is 28,676 square kilometers (11,072 square miles). As compared with most of the other American republics, Haiti is densely populated, though the number of inhabitants cannot be stated with accuracy. An estimate of 1909, based on parish registers, placed the population at about 2,030,000; an estimate for 1912 was 2,500,000, though it is probable that this figure is too high. About 90 per cent of the people are negroes, and most of the remainder mulattoes. City populations are not well known. Port-au-Prince is said to have over 100,000 inhabitants; Cap-Haïtien, about 30,000; Les Cayes, 25,000; Gonaïves, 18,000. There are some 400 national schools, besides a number of private schools, and five lycées. Elementary instruction has been nominally compulsory since 1910, but the educational system is very imperfect, and illiteracy prevails. The people speak a French patois and profess Roman Catholicism.

PRODUCTION, COMMERCE, ETC. The most important crop commercially is coffee; other crops are cacao, sugar cane, tobacco, and cotton. Valuable woods, especially logwood, are cut for export. There are several sugar mills, and rum and other spirits are distilled. The mineral resources are not unimportant, but mining is almost entirely undeveloped.

For foreign commerce, the latest figures available are those for the fiscal year 1913, when imports were valued at \$8,100,125, and exports at \$11,315,539; imports and exports in the fiscal year 1912, \$9,876,555 and \$17,285,485. For 1913 the total coffee export was reported at 56,962,000 pounds; cotton, 4,266,000 pounds; cacao, 3,898,000 pounds; cotton seed, 7,922,000 pounds; honey, 1,231,000 pounds. The share of the principal countries in the trade has been estimated as follows, in thousands of dollars:

	Imports		Exports	
	1912	1913	1912	1913
United States	7,302	5,909	1,100	1,000
France	1,053	817	8,500	5,000
United Kingdom	761	593	1,800	800
Germany	485	536	6,100	4,200

Vessels entered at the ports in 1914, 871 steamers, of 1,747,827 tons, and 35 sail, of 23,719 tons. There are about 225 kilometers (140 miles) of railway, including light railway. Tel-

egraph line (1910), 124 miles; post offices (1911), 88.

FINANCE. The greater part of the revenue is derived from customs. Duties on both imports and exports are payable in American gold. The paper gourde, nominally equivalent to about 96.5 cents, is current at about one-fourth its face value. For the fiscal year 1914, the estimated revenue was \$5,078,754 and 4,898,680 gourdes; estimated expenditure, \$3,904,291 and 9,095,000 gourdes. Estimated revenue for 1915, \$4,980,147 and 4,959,386 gourdes; estimated expenditure, \$4,847,385 and 8,777,627 gourdes. By far the largest item of expenditure is service of the debt, estimated for the fiscal year 1915 at \$4,007,147 and 149,000 gourdes. Public debt, July 1, 1914, \$25,892,181 and 13,534,812 gourdes.

GOVERNMENT. The legislative power is vested in a National Assembly of two chambers, the Senate and the Chamber of the Communes. Members of the lower house (96 in number) are elected by direct vote for three years. Senators are elected for six years by the Chamber of the Communes from a list prepared partly by the President of the republic and partly by the electors. According to the constitution, the President is elected for seven years by the two chambers in joint session. Haitian presidents, however, seem unable to serve out their term. An account of recent revolutionary movements is given below. On Aug. 12, 1915, Philippe Sudre Dartiguenave, a senator, was elected President; he was recognized by the American government on September 17th following.

HISTORY. *The Guillaume Revolution.* After the two successive revolutions of 1914, which established first Oreste Zamor and then Davilmar Théodore as president of the turbulent republic, Haiti was again plunged into civil war by the outbreak of a third revolution in January, 1915. The leader of the new movement was Gen. Vilbrun Guillaume Sam, who turned traitor to the Théodore government about the middle of January and enlisted the support of various professional insurgents. He took possession of the important town of Cap Haïtien, January 16, after General Metallus, who was loyal to President Théodore, had evacuated the place. Encouraged by this early success, Guillaume began an energetic campaign, capturing Plaines, Trou Ounamenthes, Fort Liberté, and Limonade. His next attack was directed against Port-au-Prince, the capital and principal seaport of Haiti. His troops easily captured the city, and Guillaume announced the success of his revolution by proclaiming himself President of the republic. President Théodore, completely defeated and discredited, took refuge upon a Dutch vessel in the harbor of Port-au-Prince. With Guillaume's victorious army in possession of the capital and Théodore a fugitive, the National Assembly was easily persuaded to proclaim Guillaume provisional President of the republic. No sooner had General Guillaume established himself in the presidency than he was confronted by a counter-revolution, for ex-President Oreste Zamor, who had ingloriously fled the country in 1914, now returned to harass the new government. Zamor's forces, however, were easily defeated in a battle near Hinche, March 13, and the gallant soldier of fortune was himself taken prisoner. While General Zamor, after his unsuccessful revolt, languished in the prison

at Port-au-Prince, early in April a fresh rebellion against President Guillaume was prepared by Gen. Rosalvo Bobo, a former minister of Haiti to the Dominican Republic. Cap Haitien, and Trou, and Fort Liberté quickly succumbed to rebel attacks. Grande Rivière and Limbe were captured several times by General Bobo's forces, but retaken as frequently by the presidential troops.

Financial Difficulties with the United States. The distressing political situation in Haiti was complicated by the operation of foreign financial interests. In the YEAR BOOK for 1914, mention was made of the difficulties encountered by the Haitian government with its French, German, and British creditors, and of the fact that the National Bank of Haiti had transferred a large government gold deposit from Haiti to New York City, much to the chagrin of President Théodore. Consequently, in January, 1915, President Théodore closed up the National Bank and established a new bank in its stead. The officials of the old bank raised strenuous protests. Their protests, it is interesting to note, were seconded by the American minister to Haiti. In February the interest taken by the United States government in Haitian financial questions was even more clearly manifested, when President Wilson sent ex-Governor Fort of New Jersey to Haiti with instructions to strive to bring about better relations between Haiti and the United States, and to settle the financial difficulties. When ex-Governor Fort's mission proved futile, President Wilson in April appointed a new representative, Mr. Paul Fuller, to act as the United States' representative in securing a satisfactory settlement of Haitian financial affairs. At the same time, American bankers refused to extend any credit to Haiti unless the prompt payment of interest and sinking fund charges could be guaranteed. President Guillaume was informed that in order to obtain the funds of which he stood in sore need, he would have to turn over the administration of the Haitian customs houses to United States officials. In spite of his necessity, and in disregard of Mr. Fuller's plausible arguments, President Guillaume absolutely refused to make the desired arrangement, which would have been equivalent to making his country a financial protectorate of the United States. In his defiance of the United States, he was supposed to have the support of Haiti's French and German creditors, who presumably would be reluctant to have the Haitian customs revenues pass into American hands.

Assassination of President Guillaume. Notwithstanding his financial perplexities, President Guillaume succeeded in crushing the rebellions instigated against him. In May his troops, with the support of government gunboats, recaptured Cap Haitien and several smaller places, forcing General Bobo to flee to Trou. In July another revolutionary band under Gen. Quartier Morin was defeated and dispersed, and the railway between Cap Haitien and Grande Rivière could be opened to traffic for the first time since April. By casting his rivals and opponents into prison, and by the employment of dictatorial methods, President Guillaume sought still further to enhance his own power. But a new rebellion was already brewing. Tales of the cruel treatment of political prisoners filled the populace of Port-au-Prince with horror.

The climax came in August, when General Oscar, governor of Port-au-Prince, and an associate of Guillaume, massacred 160 political prisoners, including that Oreste Zamor whose unsuccessful attempt at insurrection has already received notice. The massacre was immediately followed by a popular uprising in Port-au-Prince. The palaces of Oscar and Guillaume were captured by mobs. Both Oscar and Guillaume were shot down, and their bodies dragged through the streets of Port-au-Prince. Gen. Sudre Dartiguenave, president of the Senate, was elected by the National Assembly to act as provisional President of the republic.

American Intervention in Haiti. The failure of Mr. Fuller's mission and the continuance of chaotic political conditions in Haiti convinced the United States government that armed intervention was necessary in order properly to protect American interests. Consequently, in June Rear Admiral Caperton was ordered to proceed with the armored cruiser *Washington* from Vera Cruz to Cap Haitien to relieve the French cruiser *Descartes* which had been keeping order. In July American marines, in attempting to land at Port-au-Prince, were attacked by natives. In the ensuing skirmish two marines and six natives were killed. Rear Admiral Caperton attempted in August to bring about an end of the many revolutions by sending a commission to the leading revolutionary chiefs. General Blot agreed to withdraw from the conflict, but General Bobo rejected the proposal. On August 5th marines from the battleship *Connecticut*, which had been ordered to Haiti, took possession of the fort dominating the city of Port-au-Prince. This action brought about resistance from the Haitians, with the result that one native was killed. Three days later Rear Admiral Caperton took over the administration of the customs house of the capital. The rioting which followed the election of General Dartiguenave as president of the republic (*supra*) made it necessary to place Cap Haitien under martial law and to send a force of American marines also to occupy St. Mare. A week later the Americans entered Port de Paix, a town of 10,000 inhabitants situated northwest of Cap Haitien. Late in August the announcement was made that the United States had asked Haiti to accept without delay the draft of a convention which undertook to establish an effective control of Haitian finances by the United States. On September 16th this convention was signed by both parties. It provided for (1) the establishment of a Haitian receivership of customs under American control; (2) the establishment of a native constabulary force under the command of American officers; (3) the establishment of American control over the finances of Haiti to an extent necessary to safeguard the interests of the Haitian people and of their foreign creditors; and (4) a term of 10 years during which the treaty was to remain in force, with the possibility of extending it at the expiration of that period if either of the signatories should so desire. Meanwhile, without waiting for the signature of the convention, the American forces which had landed in Haiti had already assumed control of the Haitian customs houses, and Paymasters Rogers and Van Patten were appointed collector of customs and captain of the port, respectively. Frequent skirmishes between the American marines and the Haitian insurgents were reported

throughout September and October. Near Gonaïves, September 19, an engagement was fought in which 2 Americans and 16 Haitians were killed. Near Cap-Haïtien, September 26, a more sanguinary battle was fought, in the course of which 40 Haitians and 1 American were killed and 10 Americans were wounded. Two of the Haitian leaders, General Pétion and General Morency, entered into peace agreements with the American commander, September 29 and October 1. All effective opposition having been extinguished by the American landing party, the agreement recently negotiated could now be ratified by the Haitian House of Representatives, the first week in October. The Haitian Senate signified its approval of the treaty a little more than a month later, November 12. It then only remained for the United States Senate to ratify the treaty in order to complete the formal ratification of the virtual protectorate which had already been established by force of arms. By the middle of November the last sparks of insurrection were reported to have been stamped out, and Pres. Sudre Dartiguenave, thanks to American support, enjoyed the unique distinction of maintaining order in the republic. The government of President Dartiguenave had received formal recognition from the United States in September; France, however, withheld recognition until the President consented, November 25, to offer formal apologies for an attack which had been made on the French legation at the time of Guillaume's overthrow.

For further details regarding the American intervention in Haiti, see UNITED STATES, *Foreign Relations*.

HALIFAX. See DOCKS AND HARBORS.

HALL EXPLORATIONS. See EXPLORATIONS, *Asia*.

HALL OF FAME. An election for additional members to the Hall of Fame at New York University was held in 1915. Of the 212 nominees proposed by the public 179 were men and 33 women. In the election held in September the 97 electors chose nine names as follows and by the vote indicated: Alexander Hamilton, 70; Mark Hopkins, 69; Francis Parkman, 68; Elias Howe, 61; Joseph Henry, 56; Rufus Choate, 52; Daniel Boone, 52; Charlotte Cushman, 53; Louis Agassiz. Hamilton and Agassiz had been elected in 1905 to a separate hall instituted for notable foreign born Americans. In 1914 it was decided to do away with this discrimination. John Paul Jones and Roger Williams had also been elected to the hall for foreign-born, but they failed of reelection, when Hamilton and Agassiz were successful. However, they remained in nomination for the year 1920. The total number of names admitted in the four elections thus far held include those of 50 men and of 6 women.

HAMILTON COLLEGE. An institution for higher education at Clinton, N. Y. The total enrollment in all departments in the autumn of 1915 was 189. The faculty numbered 29. There were no notable changes in the membership of the faculty during the year. Several small benefactions were received. The productive funds at the close of the fiscal year 1915 amounted to \$1,100,000. In the library were 67,000 volumes.

HAMPTON NORMAL AND AGRICULTURAL INSTITUTE. An institution for the

higher education of negroes, at Hampton, Va. The total number of students in all departments, including the primary day school and summer school, in the autumn of 1915 was 1780. The faculty numbered 130. The productive funds for the fiscal year ending June 30, 1915, amounted to \$2,835,304. The total receipts from all sources for the same period \$478,735. The library contained 35,419 volumes. During the year Mayor Richard Moton, who had been identified with Hampton, was chosen to head Tuskegee Institute in succession to Dr. Booker T. Washington.

HANDBURY, THOMAS HENRY. An American soldier, died April 23, 1915. He was born in Pennsylvania, and graduated from West Point in 1865. In the same year he was appointed second lieutenant in the artillery, but was transferred to the engineering corps in 1866 as first lieutenant. He served in San Francisco until 1872, when he was detailed to West Point as assistant professor of engineering, remaining there until 1876. From 1883-88 he was engineering officer of the division of Missouri, and from 1888-93 was in charge of the improvements in the mouth of the Columbia River. He was superintending engineer of the Mississippi River improvements from the mouth of the Missouri to the mouth of the Ohio, from 1896-99. In 1905 he was promoted to colonel, and was retired.

HARBORS. See DOCKS AND HARBORS.

HARDIE, JAMES KEIR. An English labor leader, and member of Parliament, died Sept. 26, 1915. He was born in Scotland in 1856, and at the age of seven was put to work in the mines as helper. He continued to earn his living in the mines until he was twenty-four years old. In his spare moments he studied diligently, and early became impressed with the necessity of doing something for the working classes. While still a workman he took an active part in the organization of mining labor, and was elected secretary to the Lanarkshire Miners Union. In 1882 he was appointed an editor of the *Cummock News*, and continued in that capacity until 1886. In that year he went actively into politics, and in 1888 became the Labor candidate for Mid-Lanark. He was elected to the House of Commons in 1892, was defeated in 1895, and returned in 1900, from Wales. He became one of the most notable leaders in the labor movement, and visited the United States in 1895, and again in 1908. He returned the following year, and three years later made a tour of the United States and Canada. Mr. Hardie was a Socialist, and was violently opposed to war. On Aug. 2, 1914, he delivered a speech in Trafalgar Square, London, in which he demanded that Great Britain remain neutral. He called upon the working men of the world to use their influence, industrial and political, to stop the war. On Aug. 27, 1914, he caused a bitter demonstration in the House of Commons when he attempted to cross-examine Sir Edward Grey, concerning the negotiations then being carried on. On Feb. 14, 1915, Hardie was one of the 40 Socialist leaders who met in London to discuss the attitude of Socialists during the war. The resolution was then adopted concerning the right and duty of the nation to defend itself from attack. In 1907 he made visits to India and Australia. He was the founder of the *Labor Leader*, a frequent contributor to magazines and reviews, and chair-

man of the Independent Labor Party. Hardie was one of the most interesting and picturesque figures in British public life for more than 25 years. As a Socialist leader of the Labor Party in the House of Commons he acquired wide fame.

HARDY, JOSEPH JOHNSON. An American educator, died May 2, 1915. He was born in New Castle, England, in 1844, was brought to the United States by his parents in 1846, and graduated from Lafayette College in 1870. In 1891 he became professor of mathematics and astronomy in that college and held this position until his death. He was the author of *Analytical Geometry, Infinitesimals and Limits*.

HARRIS, ANDREW LINTER. An American government official, former Governor of Ohio, died Sep. 13, 1915. He was born in Butler County, Ohio, in 1835, and graduated from Miami University in 1860. He was appointed second lieutenant in the 20th Ohio infantry in 1861, and served throughout the war, rising to the rank of brigadier-general of volunteers. In 1865 he was admitted to the bar, and from 1875 to 1882 was probate judge of Preble County. He was a member of the Ohio Senate from 1865-67, of the House of Representatives 1885-89, lieutenant-governor of Ohio from 1892-96. He was a member of the United States Industrial Convention from 1898-1902, and from 1906-09 was Governor of Ohio. He was a member of several patriotic societies.

HARRISON LAW (NARCOTIC LAW). Enacted on Dec. 17, 1914, the Harrison Federal Law went into effect on March 1, 1915. It obliges every distributor of opium, morphine, chloral, or other narcotics to pay a special tax to the local collector of internal revenue, and display prominently a special license. Records must be kept by the druggist or dealer, or the physician who dispenses the narcotic, stating how much was dispensed, for what person, and under what physician's order, under severe penalties for neglect. These records must at all times be open to irregular calls of an inspector. Noticeable lessening of the use of narcotics has been the result, and the number of addicts seeking relief from the sufferings of rapid withdrawal is already decreasing.

HARVARD UNIVERSITY. The total enrollment in all departments in the autumn of 1915 was 5699. The faculty numbered 859. The university received in April, \$100,000 by the will of James J. Myers, of Cambridge. The Widener Memorial Library, erected in memory of Harry Elkins Widener, was dedicated on June 24th. This library ranks third in capacity among the libraries of the country. On October 4th gifts amounting to \$155,601 were announced, and on October 27th gifts amounting to \$142,000 and including \$125,000 given by James J. Hill were announced. The total productive funds at the end of the collegiate year 1914-15 amounted to \$25,448,701. The annual income was about \$3,000,000. For further notice in regard to the university, see UNIVERSITIES AND COLLEGES.

HAUPTMANN, GERHART.—PERFORMANCE OF "THE WEAVERS" IN ENGLISH. See DRAMA, AMERICAN AND ENGLISH.

HAWAII. POPULATION. The estimated population of the Hawaiian Islands on June 30, 1915, was 232,856, which includes 9600 soldiers and officers of the army and navy. The Orientals numbered 136,626. Native full blooded

Hawaiians continued to decrease. The total number of births was 8507, an increase of 1751 over 1914. The total number of deaths was 3556, a decrease of 151 from the previous year.

INDUSTRIAL CONDITIONS. The year 1915 was one of unusual prosperity. A greater quantity of sugar was produced than in 1914 and the financial returns from this staple were greater. The second commodity in importance as regards production and gross value was canned pineapple.

COMMERCE. The total imports from the United States for the fiscal year 1915 amounted to \$20,295,829. Of this \$11,799,316 represents manufactures ready for consumption. The shipments from Hawaii to the United States amounted to \$60,610,935; of this \$59,345,247 represents food-stuffs. The total value of the sugar exported to the United States was \$52,959,697. Canned pineapple amounted in value to \$5,986,198, and the total of fruits and nuts to \$6,189,203.

EDUCATION. The number of school children increased 3241 in 1915, making a total of 36,529. The school accommodations under the bungalow system of buildings so well adapted to the climate and financial resources are rapidly supplying the demand for room for the marked increase of pupils.

FINANCE. The assessments of property increased \$15,413,996 over 1914, making a total of \$176,401,222. The total revenue collected by the Territory and countries aggregated \$4,691,831. Of this \$2,557,675 was set aside by law for the county governments, and \$2,134,156 remained for territorial expenditure; \$3,162,148 was available for the Territory from current revenues and \$2,747,270 was expended, leaving a net cash balance at the close of the year of \$414,878. The bonded indebtedness of the territory was increased during the year by the sale of \$1,179,500 of 4 per cent public improvement bonds, issued in 1914, and was decreased by the payment of \$150,000 of 4½ per cent public improvement bonds.

PUBLIC HEALTH. The general health conditions in the islands were better during the year than during 1913 and 1914. At the last session of the Legislature a number of new laws relating to public health were passed and some amended. Provision was made for the care, control, and treatment of persons addicted to the excessive use of drugs or liquor.

PUBLIC WORKS. Public works were energetically pushed forward during the year, particularly wharves and water-front improvements. Nearly every island port had some attention. The construction of a modern prison was commenced during the year. Plans for material enlargement of Honolulu harbor were made but the necessary appropriations had not been made by Congress. Extensive wharf improvements are being entered upon by Honolulu.

Work was renewed on the great naval dry-dock, which was begun in July, 1909, in the early part of 1915. Owing to the great pressure through the porous coral reef on which the dock is built, the bottom heaved upward on Feb. 17, 1913, and work ceased at that time. New plans were adopted, and the dock will be much larger than originally designed. The new dimensions are 1029 feet long, 148 feet wide at the top, and 35 feet of water on the sills. The total cost under new contract will be \$4,442,152. The date for completion is July 1, 1918.

HAWAWEENY, RAPHAEL. A bishop of

the Syrian-Greek Orthodox Church, died Feb. 27, 1915. He was born in Damascus and graduated from the Syrian Greek Orthodox School in 1870. In 1876 he was ordained a deacon and the following year having become a priest was made abbot of St. Ignatius in Moscow. In 1893 he was appointed lecturer of the Arabic language at Kazan. He removed to the United States in 1895 as the head of the Syrian Greek Orthodox Mission of North America, and in 1904 was made bishop of North and South America, which position he held until his death.

HAY. Data on the production of hay in 1915 were available only for the United States, which produced the largest crop in its history. The production, according to estimates by the Department of Agriculture, amounted to 85,225,000 tons, which was 12,534,000 tons above the next largest crop—produced in 1912. An area of 50,872,000 acres was devoted to the crop, and while this was quite large, exceeding the area of the preceding year by more than 1,500,000 acres and the average area for the five-year period, 1909–13, by over 1,000,000 acres, it was surpassed in several previous years. The average yield of 1.68 tons per acre also constituted a record and was one-fourth of a ton above the acre yield for 1914 and over one-third of a ton above the acre yield for the five-year period 1909–13. Although the farm value on December 1, \$10.70 per ton, was 42 cents under the corresponding value the year before and \$1.43 under the same value for the five-year period above mentioned, the total value of the crop estimated on this basis stood unsurpassed and amounted to \$912,320,000. Estimates published by the Department of Agriculture during the year place the area of wild hay, or hay made from the natural grasses growing on uncultivated lands, cut in the North Central States west of the Mississippi, at 12,675,000 acres, 523,000 acres more than the tame hay in those States and almost three-fourths of the estimated total of approximately 17,000,000 acres of wild hay cut in the entire country. The same authority published estimates pointing out that in addition to the hay fed to the live stock of the country about 55 per cent of the estimated annual production of 120,000,000 tons of straw of wheat, oats, barley, rye, rice, flax, and buckwheat are used for feeding purposes. See also AGRICULTURE.

HAY, JOHN. See LITERATURE, ENGLISH AND AMERICAN, *History*.

HAZELTINE, GEORGE. An American lawyer and editor, died Sept. 9, 1915. He was born in Bradford, Mass., in 1829, and graduated from Dartmouth College in 1854. In 1862 he removed to London where he was for a time editor of the *London American*. He then began the practice of law in that city, and for several years was one of the best known lawyers in London, taking part in the trial of many important cases on letters patent before the King's bench. In 1876 he returned to New York, and became senior member of a patent firm under the name of Hazeltine and Co. He was for many years one of the leading patent lawyers of the world, and was largely responsible for the present patent laws of Germany. He was an intimate friend of President Lincoln, and other prominent men of that time. He received the degree of LL.D. from the University of Chicago and the University of Albany.

HEARN, LAFCADIO. See LITERATURE, ENGLISH AND AMERICAN, *Essays*.

HEIDENSTAM, VERNER VON. A Swedish scientist, who in 1915 received a third of the Nobel Prize for literary work. Born in 1859, his earliest tastes were for painting, which he adopted as a profession, but was obliged to give up on account of ill health. After spending some time in traveling abroad he returned to Sweden, took up his residence in Stockholm, and devoted himself to writing. His first work, published in 1888, was called *Vallfart och Vandringar*. Its merits brought him into the front rank of Swedish poets. This volume was followed by a book on travel entitled *From the Col di Tenda to Blocksberg*, and this was followed in 1889 by a novel called *Endymion*. In 1892 appeared the novel by which his name and literary style are best known. It is entitled *Hans Alienus*, and is partly allegorical and partly biographical. With this book Heidenstam took his place in the new school of high intellectual thought and conservative tendencies. He published other books, including poems, novels, and essays. These include *Charles XII and His Wars*, published in 1897–98. This indicated the beginning of the interest in Swedish national life and history, which has given Heidenstam wide popularity wherever the Swedish language is read or spoken, and was chiefly instrumental in bringing him the Nobel Prize. Other works include *Tankar Och Techningar* (1899); *St. George and the Dragon* (a collection of sketches, 1900); *The Pilgrimage of the Holy Bridget* (1901); *Classicism and Teutonism* (1901); *Folkungatradet* (a Viking novel, 1905); *Dagar Och Handlingar* (1909); *Svenskarna Och Deras Hordingar* (1909); *Proletar-Filosofien Upplosging Och Fall* (1911); and *Stridskiften* (1912).

HENDERSON, CHARLES RICHMOND. An American sociologist and educator, died March 29, 1915. He was born in Covington, Ind., in 1848. He graduated from the University of Chicago in 1870, and studied at the Baptist Union Theological Seminary. In 1873 he was ordained to the Baptist ministry, and served in pastorates in Terre Haute, Ind., and Detroit. In 1892 he was appointed assistant professor of sociology and university recorder at the University of Chicago. He became associate professor in 1894, and professor of sociology in 1897. From 1904 until his death he was the head of the department of practical sociology. He was associate editor of the *American Journal of Theology*, *American Journal of Sociology*, and the *Journal of the American Institute of Criminal Law and Criminology*. He held office at many conferences of charities and corrections in the United States and abroad, and was a member of many associations. He received a Ph.D. from Leipzig in 1901. His published writings include *Introduction to Study of Dependent, Defective and Delinquent Classes* (1893–1901), *Development of Doctrine in the Epistles* (1894), *The Social Spirit in America* (1896), *Social Settlements* (1897), *Social Elements* (1898). He also edited important volumes relating to social subjects.

HENSEL, WILLIAM UHLER. An American lawyer and educator, died Feb. 27, 1915. He was born at Quarryville, Pa., in 1851, and in 1870 graduated from Franklin and Marshall Col-

lege. In 1873 he was admitted to the bar, and in 1891 was appointed attorney-general to the State of Pennsylvania, holding this position until 1895. He was prominent in politics, being chairman of the State Democratic Committee 1882-87, and delegate to many Democratic national conventions. He received the degrees of LL.D. from Dickinson College, Washington and Lee College, and Litt.D. from Franklin and Marshall College in 1912, and was a member of several learned societies.

HEREDITY. See *EUGENICS, passim*; and *IN-SANITY*.

HERRESHOFF, JOHN BROWN. An American yacht designer, died July 20, 1915. He was born in 1841 in Bristol, R. I. As a result of an accident when he was 15 years of age he became totally blind. In spite of this he established a ship-yard and built several small craft which were noted for their speed. In 1873 with his brother, Nathaniel Green Herreshoff, he began to design and build steam vessels and steam launches. In 1893 the brothers designed and built the cup defender *Vigilant*, and from that time they constructed every yacht built to defend the *America's* cup. These include the *Defender*, *Columbia*, *Reliance*, and *Resolute*. The last named was built in 1914.

HERVIEU, PAUL ERNEST. A French dramatist, died Oct. 25, 1915. He was born in 1857, at Neuilly-sur-Seine, just outside the city of Paris, and was educated at Lycée Condorcet and the Ecole de Droit, in Paris. He studied law and began practice in 1877. Soon afterwards he entered the diplomatic service and was appointed secretary to the French legation in Mexico. He resigned this post in 1880 to devote his talents to literary work. His first publication was a series of political, social, and satiric sketches. His first play, *Les paroles restent*, was produced in Paris in 1892. This was followed by *Les tenailles* (1895), *La loi de l'homme* (1897), *Point de lendemain* (1901), *L'énigme* (1901), *Théroigne de Mericourt* (1902), *Le dédale* (1903), *Le réveil* (1905), *Connais-toi* (1909), *Bagatelle* (1912), and *Le destin est maître*, which last was produced at the Théâtre Port Saint-Martin, Paris, in 1914. His masterpiece is generally considered to be *La course du flambeau*, which was produced in Paris in 1900. His dramas were nearly all intended to illustrate some philosophical point in which he was at the time especially interested, and many of them attacked the divorce laws of France. Hervieu was a prolific writer of short stories, and one of the most successful of contemporary playwrights, the greater number of his works being produced by actors of wide reputation. In 1913 M. Hervieu, angered by criticisms published in *L'Action Française*, challenged its editor, Leon Daudet, to a duel. They exchanged four shots, none of which took effect, and shortly after this a reconciliation was effected by their friends. M. Hervieu was a member of the French Academy, a grand officer of the Legion of Honor, and was for many years president of the Society of Authors. See also *FRENCH LITERATURE, Literary Events*.

HEYWOOD, CHARLES. An American officer of the marine corps, died Feb. 26, 1915. He was born in Waterville, Me., in 1839. In 1858 he was appointed second lieutenant and two years later became captain. His first service was in quelling quarantine riots in Staten Island, N. Y., in 1868. Later he was on special service taking captured negroes back to Africa. He served on the United States battleship *Cumberland* from September, 1860, until she was sunk by the *Merimao* in 1862. He took part in the battle of Hatteras Inlet, and in the capture of Forts Hatteras and Clark. During the battle of Mobile Bay he was on the *Hartford*, and was also present at the capture of Forts Gaines, Morgan, and Powell. He was brevetted major and lieutenant-colonel for distinguished gallantry. After the war he commanded battalions of marines at Baltimore, Philadelphia, and Reading during labor riots. In 1885 he organized and equipped a battalion to open transit and protect American lives and property at Panama. From 1891 to 1903 he was commandant of United States marine corps, and in the latter year he was retired with the rank of major-general.

HINDENBURG, PAUL VON BENECKENDORF UND VON (1847—). A German soldier born in Posen. He entered the army in 1866 and served in the war against Austria in that year, and in the Franco-Prussian War in 1870-71. He distinguished himself at Königgratz in the former, and at St. Privat and the battle of Sedan in the latter. He received a military education (1872-75) and served on the General Staff and as head of the War Department. He became major-general in 1900 and lieutenant-colonel in 1903. In 1911 he was retired, but at the outbreak of the great war in 1914 was recalled and given chief command of the campaign against Russia. At Tannenberg he won a great victory over the Russians. In 1870 and 1914 he was decorated with the Iron Cross, and in the latter year was made a field marshal. He commanded the great drive into Russia, in 1915, which conquered Poland and threatened Riga and the Black Sea ports. See *WAR OF THE NATIONS*.

HISTAMINE HYDROCHLORIDE. This substance has a powerful contractile action on certain muscular fibres, as well as a strong vasoconstrictor action. It was first prepared synthetically by Windaus and Vogt in 1907, and was isolated from ergot in 1910 by Kutscher, Barger, and Dale. The drug is a valuable reagent for the standardization of pituitary and similar preparations, but has not yet been recommended for therapeutic use in place of pituitary extract, in spite of its similarity in physiologic action.

HISTORICAL ASSOCIATION. AMERICAN. The Association held a special session in July, 1915, at the Panama-Pacific Historical Congress in California. The papers read there dealt with the history of Spanish-American States, the Pacific States, British Columbia, Alaska,

Japan, Philippines, and Australasia in their respective relations with the Pacific Ocean. President H. Morse Stephens gave an address on the "Conflict of the European Nations in the Pacific Ocean." The regular annual meeting, held at Washington on Dec. 27-31, 1915, was exceptionally well attended on account of the interest aroused by a controversy as to the relationship between the Association and its official publication, *The American Historical Review*. After a report by Prof. Edward P. Cheyney a vote of confidence was given to the editors of the *Review*. A large number of excellent papers were read at the meeting. Three sessions were devoted to the topic of nationalism, and in his presidential address Professor Stephens placed special emphasis on the criminal responsibility of nationalistic historians. The session on ancient history was devoted to "Economic Causes of International Rivalries and Wars in Ancient Times." Another session discussed mediæval colonization, and in the American history session Prof. William I. Hull discussed the Monroe Doctrine as applied to Mexico, and Sen. Albert J. Beveridge described some interesting traits of character of John Marshall. The meeting also gave further impetus to the movement for a Federal Archives Building. The following officers were elected at the annual meeting: President, G. L. Burr; first vice-president, Worthington C. Ford; second vice-president, William Roscoe Thayer. The council consists of E. C. Barker, G. S. Ford, C. H. Haskins, U. B. Phillips, Lucy M. Salmon, and S. B. Harding. J. Franklin Jameson is managing editor of the *Review*. The present membership of the American Historical Association is about 3000.

HISTORY. For noteworthy historical works of the year, see historical sections of articles referred to under LITERATURE.

HOCKEY. The St. Nicholas Skating Club of New York City for the second successive year won the championship of the American Amateur Hockey League, but only after a hard fight with the Boston A. A. seven, a newcomer in the organization. St. Nicholas scored 7 victories as against 1 defeat, while Boston won 6 games and lost 2. The standing of the other teams was: Hockey Club of New York, won 3, lost 5; Crescent A. C., won 3, lost 5; Irish-American A. C., won 1, lost 7. Games between American and Canadian teams resulted as follows: St. Nicholas S. C. 3, Toronto Argonauts 2; St. Nicholas S. C. 4, Queens University 1; St. Nicholas S. C. 5, St. Michaels, Toronto, 1; Ottawa University 7, Crescent A. C. 3; Ottawa University 8, Boston A. A. 2. The Wanderers of Ottawa won the championship of Canada by defeating Montreal in the final game. The score was 4 to 1. The Wanderers of Montreal vanquished Quebec in a series of professional matches played in New York City. The inter-collegiate championship was won by Princeton for the third year in succession. Harvard was second and Yale third.

HOEBER, ARTHUR. An American painter and art critic, died April 29, 1915. He was born in New York in 1854 and educated in the public schools of that city. He studied at the Art Students' League, and afterwards in Paris under Gerôme. He contributed to several exhibitions in Paris, and then returned to the United States where he contributed to Amer-

ican exhibitions. He engaged in writing and lecturing on art, and was for three years art critic of the *New York Times*. At the time of his death he was art critic of the *Globe and Commercial Advertiser*. He was an associate member of the National Academy of Design, and was the author of *Treasures of the Metropolitan Museum of Art*, and *Painting in the Nineteenth Century in France, Belgium, Spain, and Italy*. His work as a painter consisted largely of landscapes.

HOGS. See STOCK RAISING AND MEAT PRODUCTION.

HOLDER, CHARLES FREDERICK. An American naturalist and writer, died Oct. 10, 1915. He was born at Lynn, Mass., in 1851, and was educated at the United States Naval Academy in the class of 1869, resigning before graduation. In 1871 he was appointed assistant at the American Museum of Natural History, serving in this position until 1875. At the opening of Throop College of Technology he was appointed to the chair of zoölogy, and after many years of service became honorary curator of its museum. He wrote many books on subjects connected with natural history and zoölogy. Among these are *Elements of Zoölogy* (1885); *Martels of Animal Life* (1886); *Crabs and Insects* (1903); *Game Fishes of the United States* (1913); *Game Fishes of the World* (1913); *The Ocean* (1914); *Angling Adventures Around the World* (1914). He wrote also many sketches and stories, and a biography of Darwin. He was an officer and member of many scientific societies.

HOLLAND. See NETHERLANDS.

HOLMES, JOSEPH AUSTIN. An American geologist and public official, died July 13, 1915. He was born in Laurens, N. C., in 1859, and graduated from Cornell University in 1881. In the same year he was appointed professor of geology and natural history in the University of North Carolina, holding this chair until 1891, when he was appointed State geologist, but remained lecturer on geology in the university. In 1904 he was given charge of the United States Geological Survey laboratories for testing fuels and structural materials. In 1907 he was appointed chief of the technology branch of the United States Geological Survey, and from 1907-10 had charge of the investigation of mine accidents. On the creation of the Bureau of Mines in 1910 he was appointed as chief, and retained this position until his death. He was a member of many scientific societies.

HOLSTEIN CATTLE. See DAIRYING.

HOME RULE, MUNICIPAL. See MUNICIPAL GOVERNMENT.

HONDURAS. A Central American republic. The capital is Tegucigalpa.

AREA, POPULATION, ETC. The area of the republic cannot be definitely stated until the Guatemalan boundary is fixed. The figure now commonly accepted is 114,670 square kilometers (44,274 square miles). The estimated population at the end of 1911 was 566,017; at the end of 1912, 578,482; at the end of 1913, 592,675. The inhabitants are chiefly Indian. In 1913 there were 22,684 births and 10,192 deaths. Tegucigalpa had 22,137 inhabitants in 1910 (1914 estimate, 28,950); Santa Rosa, 10,574; Juticalpa, 10,529; Danté, 8,477; Nacaome, 8,152. Elementary instruction is free, nominally compulsory, and secular. In 1912, elementary

schools numbered 890, with 35,703 pupils; in 1913, 916, with 40,565 pupils. For secondary education, the government subsidizes colleges in the departments and maintains a central institute at Tegucigalpa. At the capital, also, the government supports a so-called university, and at Comayagua a law school. There are five normal schools attached to the colleges.

PRODUCTION, COMMERCE, ETC. The principal crop is bananas, which are cultivated especially along the eastern coast. Corn is next in importance, and other crops are sugar cane, tobacco, coffee, and coconuts. Cabinet woods, particularly mahogany, and rubber are exported. Grazing is an important industry; the number of cattle in 1912 is reported at 420,275, and in 1914 at 489,185; in the latter year there were reported 68,059 horses, 24,700 mules, 22,778 goats, and 180,092 swine. Some gold and silver are mined, but there is little other development of the large mineral resources of the country.

In 1913, imports and exports were valued at \$5,132,678 and \$3,300,254, respectively; in 1914, \$6,624,930 and \$3,421,331. The largest imports are cotton goods and foodstuffs. The principal export is bananas; gold and silver cyanides rank next, followed by coconuts, cattle, and hides and skins. The trade by principal countries is shown below, in thousands of dollars:

	Imports		Exports	
	1913	1914	1913	1914
United States	8,457	5,262	2,869	2,974
Germany	558	522	176	165
United Kingdom	713	460	18	18
France	148	142	2	5

The reported length of railway in 1913 was 186 kilometers (116 miles); in addition, 55 kilometers (34 miles) of plantation railway. In 1914, telegraph offices numbered 250, with 6980 kilometers of wire. Post offices (1912), 278.

FINANCE. The silver peso is the monetary unit; its value fluctuates with the price of silver. At the beginning of 1913 it was worth about 45.1 cents; 1914, about 43.4 cents; 1915, 39.8 cents. Revenue for the fiscal year 1914 amounted to 5,895,194 pesos, as compared with 5,207,232 pesos for 1913, and 4,627,905 pesos for 1912. Expenditure for the fiscal year 1914, 5,774,415 pesos. The expenditure by departments was: interior, 802,043; justice, 176,952; foreign affairs, 134,701; public instruction, 387,798; fomento, public works, and agriculture, 816,868; war and marine, 1,727,215; treasury, 456,607; public credit, 1,272,230. The foreign debt at the end of 1914 amounted, with arrears of interest from 1872, to £30,803,868; internal debt (Aug. 31, 1913), 5,474,732 pesos.

GOVERNMENT. The Congress, which consists of one chamber of 42 members, the President, and the Vice-President, are elected for four years by direct vote. In November, 1911, Gen. Manuel Bonilla was elected President, and Francisco Bertrand Vice-President. They were inaugurated for the four-year term Feb. 1, 1912. On March 13, 1912, Bonilla died and was succeeded by Bertrand. In 1915 Bertrand, with the consent of the Congress, resigned in order that he might become a candidate for the ensuing term; the executive authority was assumed by the first designate, Alberto Membreño, for the period Aug. 1, 1915, to Feb. 1, 1916. Bertrand and Membreño were elected President and Vice-Presi-

dent, respectively, for the term to begin Feb. 1, 1916.

HISTORY. An *ad referendum* treaty of free commerce between Honduras and Salvador was concluded in Tegucigalpa on June 26th. Subject to the approval of the national legislatures of the two countries, the treaty was to be in force for a period of 10 years, or for an indefinite period thereafter, unless either of the contracting parties should desire its discontinuance. Under the terms of the treaty, free exchange of native products was permitted between the two nations, and likewise the exchange of articles manufactured from the raw products of either nation.

HONGKONG. An island (about 32 square miles) off the southeast coast of China, which, with a strip of territory on the mainland leased from China (376 square miles) and about four square miles of the Kowloon Peninsula, forms a British colony. Civil population (1911), 456,730 (Chinese, 444,664). Capital, Victoria (219,755). The island is the centre of an enormous trade. Being a free port, no trade returns are available, but a record of the shipping gives some idea of the extent of the trade (A—ocean-going, B—river steamers, C—steamships under 60 tons in the foreign trade, D—steam launches engaged in local trade):

	Number		Tonnage	
	1911	1913	1911	1913
British A ...	3,907	4,210	7,589,995	8,449,533
Foreign A	4,180	4,679	7,917,640	9,272,635
British B	6,871	6,624	4,116,736	4,078,635
Foreign B	1,423	1,780	736,057	949,328
C	3,263	4,574	130,092	189,003
Junks	25,334	25,653	2,572,588	2,882,518
Total	44,978	47,520	23,063,108	25,821,652
Local D	461,984	416,438	10,981,990	10,720,604
Local Junks ..	36,608	26,270	2,134,054	1,200,726
Total	543,570	490,228	36,179,152	37,742,982

There is little land suitable for tillage on the island, though in the leased territory the Chinese cultivate considerable tracts. Granite quarries are worked, and various manufactories are operated. Shipbuilding and repairing are important industries. A railway from Kowloon to the Chinese frontier joins the line from Canton. The total revenue (1913) is estimated at \$8,512,308; expenditure, \$8,658,012. Public debt, £1,485,732, or approximately \$305,706.

HOOKWORM DISEASE. The first annual report of the Hookworm Commission of the Rockefeller Foundation was issued during the year, and stated that up to Dec. 31, 1914, the commission had treated 19,425 hookworm sufferers throughout the world. It also instituted an educational system by which many thousand people were taught the dangers and the means of fighting the disease. It ascertained that the infection is found within a belt which circles the globe forming a zone 66 degrees wide, centring on the equator, with practically all the countries within the zone infected. Work has been begun by the commission in Egypt, Antigua, British Guiana, Trinidad, St. Lucia, Granada, Panama, Nicaragua, Costa Rica, and Guatemala. The Government and Planters' Association has begun work on the lines of the commission in Ceylon. The labors in the South are also being prosecuted vigorously.

HOPS. The world's hop production in 1915 was estimated at 1,515,000 cwts., which was 554,000 cwts. less than in 1914. The European crop was short as a rule and in many of the principal hop growing regions the yield was only half the yield of the year before. This was due in part to a reduced acreage, but mostly to unfavorable weather conditions. Drouth early in the season together with low temperatures retarded the growth of the crop and later attacks of blight and mold caused further injury, especially in England. Favorable weather towards the close of the growing season produced a crop of good quality although the yields were low. According to foreign estimates Germany with a reduced acreage of 17 per cent as compared with the preceding year, produced 320,000 cwts.; Austria, 250,000; Russia and Belgium, each 30,000; and other countries, exclusive of the United States and England, 15,000 cwts. The hop yield of the United States was estimated at 290,000 bales, of 185 pounds each, as compared with 305,000 bales in 1914. The 1915 crop was distributed as follows: Oregon, 125,000; California, 115,000; Washington, 35,000; and New York, 15,000 bales. The acreage was slightly less than in 1914, an increase of 2 per cent in Washington and 8 per cent in California having been a little more than offset by a 20 per cent decrease in New York. The reduction in acreage in New York was the result of injurious attacks in recent years of blue mold and mildew, low yields, high cost of production, and low prices. During the year ending June 30, 1915, the United States exported 16,210,000 pounds. In the fall of 1915 there was little commercial activity in hops, although the hop trade at that time of the year is generally brisk. This inactivity was largely the result of the interference with international trade by the European war, and the large supplies of hops carried over from the crop of 1914. United States breweries consumed in 1915 about 5,000,000 pounds of hops less than in 1914, the consumption being the lowest in 10 years.

HORN, EDWARD TRAILL. A Lutheran minister, died March 1, 1915. He was born in Easton, Pa., in 1850, and graduated from the Pennsylvania College in 1869. After studying at the Theological Seminary in Philadelphia, in 1872 he was ordained to the Lutheran ministry. He served in pastorates in Philadelphia, Charleston, S. C., and Reading, Pa., until 1911, when he became professor of ethics, and theory and practice of missions in the Lutheran Theological Seminary at Philadelphia. He was president of Lutheran Ministerium from 1909 to 1911, and of the Board of Foreign Missions of the General Council of the Evangelical Church of North America. He was particularly active in liturgical work, and was regarded as the highest authority on the subject in the Lutheran Church. His writings include: *The Christian Year* (1876); *Lutheran Sources of the Common Service* (1890); *The Application of Modern Principles to the Church* (1905); *Summer Sermons* (1908).

HORN, WERNER. See UNITED STATES AND THE WAR.

HORSES. See STOCK RAISING AND MEAT PRODUCTION.

HORTICULTURE. Although the great war had a detrimental effect on commercial horticulture in Europe, the large number of crop shortages reported were due for the most part

to unseasonable weather conditions, diseases, and insect pests. There was a rather general shortage of grapes, prunes, citrus fruits, and olives, and the production of most vegetables was below normal. France produced a good crop of cider apples and the apple and pear crop in Holland was the largest in years. Certain shortages occurred in America and likewise some banner crops were produced. The commercial apple crop in 1915 was some 10 or 15 million barrels short of the 1914 crop of 50,000,000 barrels. California shipped 46,862 cars of citrus fruits as compared with 48,548 cars in 1914. The lemon crop was the largest in the history of the State, as was the fresh deciduous fruit crop, which totaled 16,778 cars as compared with 16,146 cars in 1914. Florida shipped over 25,000 cars of citrus fruits as compared with 21,500 cars in 1914. New York State shipped about 6000 cars of grapes in 1915. The total canned vegetable pack of the United States in 1914 was 15,222,000 cases of tomatoes, 9,789,000 cases of corn, and 8,847,000 cases of peas. A shortage in these packs was announced for 1915. The American peach crop of 1915 amounted to about 50,000 cars as compared with 30,000 cars in 1914. The Irish potato crop approximated 375,000,000 bushels in 1915 as compared with over 400,000,000 bushels in 1914.

EXPORT TRADE. For the fiscal year ending June 30, 1915, the United States exported fruits worth \$34,229,906; vegetables, \$10,813,151; nuts, \$703,211, or a total of \$45,746,268 as compared with \$38,786,792 in 1914. The imports for the same period were: Fruits, \$27,081,396; vegetables, \$9,329,732; nuts, \$16,819,799; a total of \$53,230,927 as compared with \$68,554,793 in 1914. Among the exports for 1915 were \$11,358,124 worth of fresh and dried apples; \$3,851,013 worth of oranges; and beans, peas, and potatoes worth \$5,984,257. Ornamental trees and plants to the value of \$3,748,666 were imported in 1915.

As the year progressed overseas shipments of horticultural products between various countries became more restricted. Some of the smaller insular countries suffered severely from the withdrawal of shipping facilities. The congestion of export products in American ports became so serious toward the close of the year that the shipment of perishable fruits and vegetables was practically abandoned and less perishable products were being sold in America at the purchaser's risk. Export sales of dried fruits broke all records. By December, the filled and unfilled contracts for dried prunes, apricots, and peaches amounted to 100,000,000 million pounds. On the other hand the fall imports of Almeria or Malaga grapes amounted to only 298,450 barrels as compared with 600,000 barrels in the fall of 1914. About December 1st, the French government placed an embargo on the further exportation of nuts from that country for an indefinite period. Receipts of foreign lemons were about cut in half.

The Brazilian government issued a loan of \$37,000,000 to the State of São Paulo for advances to planters who were to place in warehouses the 4,000,000 bags of coffee which have gone to Germany, Austria, and other markets during normal periods. The Hawaiian canned pineapple output for 1915 was about 2,500,000 cases. An active trade in fresh pineapples was established with the mainland during the year.

The canned pineapple industry is being gradually developed in the Bahamas. Japan is developing a promising export trade in onions, potatoes, and apples.

FRUIT STORAGE INVESTIGATIONS. The United States Department of Agriculture had carried on storage experiments with a number of varieties of apples in the Northwest for several years. This work showed that the time for placing apples in cold storage varies with differences of season, section, culture, and soil. Most varieties for storage should be picked at maturity, with the least possible delay from the tree to the storage. A temperature of 32 degrees is usually the most satisfactory. Contrary to common opinion, cold storage apples removed from storage for sale late in the season keep as well as or even better than apples stored at a higher temperature for the same length of time. In the case of varieties which are to be disposed of early in the season, common storage may be made as satisfactory as cold storage. At the Vermont Experiment Station apple storage experiments were conducted for four seasons in a basement room resembling in many respects a farmhouse cellar. Apples kept best by first immersing them in Bordeaux mixture and then packing them in hardwood sawdust. Those immersed in Bordeaux without packing in sawdust kept nearly as well and were somewhat better flavored.

The work of the Department of Agriculture with citrus fruit showed that oranges should be stored at from 38° to 40° F., lemons at about 42°, and grapefruit at 45°. Even at these temperatures the period of successful storage is comparatively short, not usually exceeding two months. Oranges take on a sort of brown stain in storage and are just as susceptible to serious spotting from attacks of *Colletotrichum* as are grapefruit and lemons. The results indicate that avocados may be safely held at a temperature of 32° for a period of two months or more, and other tropical fruits for corresponding periods.

CALIFORNIA GRAPES. The Department of Agriculture announced a number of results of considerable importance in the Vinifera or European grape regions of the United States. It has been found that the adaptability of varieties to soil, climate, and some other conditions can be closely forecast, but congeniality of stock and scion to each other must be determined by actual test. Different species used as stocks for the same variety may increase or diminish its vigor and productiveness as well as the quality and size of the fruit, cause it to ripen earlier or later, and bring about varying results from perfect success to almost complete failure. Congeniality of the variety to the stock materially affects the resistant qualities of the stock. Of the various American species tested as stocks, *Riparia*, *Berlandieri*, *Champini*, and *Aestivalis* are in most instances congenial to *Vinifera* varieties. Fruitfulness is increased and the time of ripening hastened in comparison with the same varieties grown on other stocks.

PLANT BREEDING. In summing up the results of breeding experiments with grapes that had been under way at the New York State Station since 1885 Hedrick and Anthony conclude that improved varieties of grapes will not be produced to any extent until the fundamental laws of heredity are understood. Many commercial

sorts fail to transmit desirable qualities. A vineyard of 1500 seedlings bred from 1898 to 1903 has been reduced by vigorous selection to less than 75 vines out of which five have been tested, named, and placed in the hands of nurserymen. Crossbred seedlings were the most vigorous. Most grapes of high quality were found to possess some European grape blood.

The experiment stations in North and South Carolina and in Georgia made some progress in investigations looking to the improvement of the Scuppernong and other Southern Fox varieties of grapes. In connection with this work the South Carolina Station found that these vines will produce larger bunches of grapes if they are pollinated by a staminate or male vine of the species rather than with pollen from within the fruiting variety.

Among numerous pears under test for immunity to blight at the South Dakota Station, Hansen found the Chinese sand pear (*Pyrus sinensis*) and the birch-leaved pear (*P. betulifolia*), a native of Northern China, to be perfectly hardy and resistant to blight. They have been used freely in crossing with many of the best cultivated pears and have been sent to several States for testing purposes.

The Florida Station has succeeded in breeding one strain of sweet corn which endures hot weather as well as does field corn. The Arizona Station has bred a sweet variety of field corn that is much more vigorous and productive under Arizona conditions than any of the commercial varieties of sugar corn.

Extensive morphological and biological researches on the cultivated radishes lead Yvonne Trouard Riolle to conclude that the cultivated radish has a dual origin. The Japanese radish (*Daiikon*) is descended from *Raphanus sativus raphanistroides*, and the Chinese and most other cultivated radishes are descended from another wild type native to central Asia, but rare or extinct at the present time.

The Oklahoma Station studied the causes of failure to set fruit in the tomato and discovered that a minute insect (*Thrips tritici*) was feeding upon the pollen to such an extent as to bring about almost complete sterility. Varieties producing large quantities of pollen suffered the least. The Pennsylvania Station finds it desirable to secure tomato and some other vegetable seed one year in advance of large plantings in order that the yielding power of the strain may be tested. In a comparison of various strains of the Earliana type of tomato a variation of more than 13 tons per acre of marketable fruit occurred.

PEDIGREEED FRUIT TREES. Although the value of propagating fruit trees from selected buds was still in dispute in 1915, the majority of investigators were in favor of the practice. The bud selection work with citrus fruits in California (see HORTICULTURE, 1914 YEAR BOOK) continued to give good results. Experiments in scion selection were started at the Canada Experiment Station, Ottawa, in 1905. The yields for the three bearing years, 1912 to 1914, indicate that the bearing habit of the parent tree has been perpetuated in each case. A similar experiment conducted with scions selected from a poor-yielding and a high-yielding Ben Davis apple tree at the Missouri Station showed no perceptible difference in the third year's crop in size, color, grade, or quality of the fruit from

the two lots of trees. Observations at the New Hampshire Station indicated that poor yielding in certain trees may be due to unhealthy conditions.

BENCH ROOT OF CITRUS TREES. The California Experiment Station found that the bench root trouble of citrus trees, which had been commonly attributed to the presence of rock or other hard substances beneath the seed when planted, was entirely due to the toughness of the fibrous seed coat through which the root is frequently unable to penetrate until it has bent and twisted itself to the detriment of the future tree. Removing the seed coat very carefully eliminates the bench root. Soaking the seeds from 36 to 48 hours before planting reduces bench root to 15 per cent of the total number of seedlings planted.

NEW FRUITS AND PLANTS. The explorer of the Department of Agriculture sent from the borders of Tibet a large collection of very interesting plants. Among them were the Tanguian almond, the Potanin peach, and an interesting series of wild forms of the ordinary cultivated peach discovered in the mountains of Shansi, Honan, and Kansu. The departmental collection of jujubes and persimmons from these western provinces was largely augmented by the recent collections, and a considerable number of hardy shrubs of probable value for dooryards had been sent in.

FRUIT JUICES. Profiting by the success in concentrating apple cider (see HORTICULTURE, 1914 YEAR BOOK) the Department of Agriculture announced a similar method of concentrating grape juice, which promised to be of value for dealers in beverages. Progress has also been made in the commercial manufacture of juices of red and black currants, blackberries, black raspberries, sour cherries, and peaches.

MISCELLANEOUS. The recently created food and market departments of New York State met with considerable success in standardizing prices for the 1915 State fruit crop. Auction sales were held in New York City and in other places central to the fruit districts. The results have been so encouraging that the department is soliciting the products of California and Florida growers.

The United States Bureau of Foreign and Domestic Commerce appointed a representative, Walter Fischer, to make a tour of the principal countries of South America in which fruit could be sold and to report exhaustively on marketing conditions there. An association was formed and incorporated at Columbus for the purpose of erecting a monument to Johnny Appleseed over his grave at Indianapolis. Johnny Appleseed, whose real name was Jonathan Chapman, was an interesting and eccentric character who sowed apple seeds in the wilds of Ohio and Indiana between 1801 and 1847.
